PAPUA, or NEW GUINEA, a very large island, or perhaps a dense cluster of islands, in the E. Archipelago, third division; between the equator and the 9th deg. of S. lat., and the 130th and 150th degs. of E. long.; having N. and E. the Pacific Ocean, W. and S. W. the sea in which Gilolo, Ceram, the Aroo Isles, &c., are situated, and S. Torres Straits, separating it from Australia. It is indented by several deep bays; but even its coast line is in many parts unknown, and its interior has been but little explored, and is, in fact, a *terra incognita*. The coast, viewed from the sea, rises gradually into hills of considerable elevation; but no mountains of any remarkable height have yet been discovered. The whole island being covered with palm trees and timber of a large size, little can be said respecting its soil, which, however, is presumed to be fertile. The cocoa-nut, the two species of the bread-fruit tree, pine-apples, and plantains are found here: nutmeg-trees also grow wild; but it is not known whether they produce good spice. It is said that there are no quadrupeds in Papua, except dogs, wild cats, and hogs; and that to the E. of Gilolo no horned animals of any description are to be found. The woods abound with wild hogs, which the natives kill with spears and bows and arrows, in the use of which they are very expert. There is reason to believe that gold is found in the interior of the island. The natives of Papua appear to consist of two distinct races; those in the W. being identical with the negroes of the E. Archipelago, while the inhabs. of the E. part of the island belong rather to the sallow complexioned long-haired natives of the South Sea Islands (*see* POLYNESIA). The Papuan negroes, of whom a brief notice is given in the art. ARCHIPELAGO, EASTERN (I. 149.), continue, for the most part, in their original state of nakedness and barbarism, devoid of homes or clothing, and subsisting principally on the precarious produce of the chase, or on the spontaneous products of the forests. On the N.W. coast, which has been the most frequently visited by Europeans, the dwellings of the natives are raised on posts, as in other parts of the Archipelago and among the Ultra-Gangetic nations of the Asiatic continent. These tenements accommodate many families, who live in cabins on either side of a wide common hall that occupies the centre of the building. The cabins are miserably furnished; a

mat or two, a fire-place, an earthen pot, with perhaps a china plate or basin, and some sago flour. As they cook in each cabin, and have no chimney, the smoke issues at every part of the roof; and at a distance the whole building seems to be on fire. Their clothes are very scanty, but they contrive to bedizen themselves so as to attract the attention of European observers. Their hair is not so short, close, and woolly as that of the African negro, and they wear it bushed out round their heads to the circumference of 2½ and 3 ft.; and, to make it more extensive, comb it out horizontally, occasionally adorning it with feathers.

The men in general wear a portion of the inner bark of the cocoa-nut tree, resembling a coarse kind of cloth, fastened round the middle; and the women use blue Surat baftas in a similar manner. Boys and girls go entirely naked till puberty. All are fond of glass and coloured china beads, and wear them about their wrist, &c. The women, as generally happens among savages, lead a laborious life; and Forrest says that he has often seen them labouring hard in fixing posts in the ground for stages, in making mats, or in forming pieces of clay into earthen pots, while the men were sauntering about.

In the interior the inhabs. are supposed to practise gardening and some sort of agriculture, as they supply the inhabs. on the coast with food, in exchange for axes, knives, and other coarse cutlery. The natives on the coast purchase these from the Malays and the Chinese, particularly the latter, from whom they also buy blue and red cloths. In exchange the Chinese carry back missoy bark, slaves, ambergris, sea slug (*bêche de mer*), tortoise-shell, small pearls, birds of paradise, and many other species of dead birds, which the Papuas have a particular method of dressing.

The Dutch may have some trade with Papua; but Mr. Earl says that no intercourse whatever takes place between it and the British settlements in Australia, Singapore, or elsewhere in the East.

The inhabs. of the more westerly islands of the E. Archipelago buy the Papuans for slaves; and the natives of the W. coast of Papua make slaves of those of the E. and sell them to strangers. With a similar view, probably, they were formerly, and perhaps still are, accustomed to assemble in great numbers, and make war on the inhabs. of Gilolo, Ceram, Ambloo, and other islands still farther W.

The Arabians, in their early voyages, appear to have come into contact with the Papuans, whom they constantly describe as cannibals. Papua was discovered by Europeans in 1511, and frequently resorted to by the Portuguese during the 16th century. Towards the end of the 18th century, Forrest, McCluer, and other British navigators visited it; since which it has been but little noticed.

PARA, formerly called *Belem*, a city and seaport of Brazil, cap. prov. of same name at the confluence of a considerable river, with the great estuary of the Tocantins, or Rio Para, on its S. side, opposite the island of Joanes or Marajo, estimated about 60 m. from the Atlantic, and 300 m. W.N.W. Maranhão; lat. 1° 30' S., long. 48° 22' 33" W. Pop., estimated at 20,000, incl. comparatively few negroes. It stands in a fertile plain, and is one of the finest Brazilian cities, its streets being straight, and the houses almost all of stone, and both solid and elegant. The cathedral, and governor's palace, are said to be magnificent edifices. There are several other churches, but only 2 convents appear to exist at present, that of the Mercenários having been converted into barracks, and the Jesuit's college into the episcopal palace and seminary. Para has a judicial tribunal, royal college, botanic garden, hospital, theatre, and arsenal. The harbour is confined, and is said to be diminishing in depth; the approach from the ocean is also rather difficult, and it is always expedient to take on board a pilot at the mouth of the estuary. The principal articles of export are cocoa, of which it exports above 35,000 bags; caoutchouc, of which it is the principal mart; with isinglass, rice, drugs, and cotton, amounting in all from 150,000*l.* to 170,000*l.* a year. The sugar grown in the neighbourhood is bad, the soil not being favourable for the cane. The communication with Great Britain is principally with Liverpool. Ships of war have been built here; and timber used to be exported to Lisbon for the use of the arsenals. The climate of Para is very hot; and thunder storms occur almost daily. It was formerly deemed very unhealthy, but in this respect it has latterly been materially improved. (*Mawe's Trav. in Brazil*, 403, 404.; *Mod. Trav.*, xxx.; *Dict. Géog.*)

PARAGUAY, an indep. state of S. America, principally between the 21st and 27th degs. of S. lat., and the 54th and 58th of W. long.; having N. and E. Brazil; S. E. and S. the territory of La Plata; and W. the latter repub. and Bolivia. Shape nearly oblong; length N. to S. about 460 m. Estimated area, 74,000 sq. m. Estimated pop. 250,000 (*American Almanac*, 1850); principally whites of Spanish descent, native Indians, negroes, and mixed races originating from the foregoing,

those of the Indo-Spanish descent greatly preponderating. Paraguay is an inland peninsula, inclosed E. and S. by the Parana and its tributary the Yajuarí, and W. and N.W. by the rivers Paraguay and Blanco. A mountain chain, the Sierra Amambay, enters Paraguay on the N., runs through it near its centre to near lat. 26°, and then divides into two branches, inclosing the basin of the Tibiquari. From the undivided chain many rivers flow on either side to join the Parana or Paraguay; but none of them require any special notice, though in the rainy season they are all swollen so as to inundate a considerable extent of country. Respecting the Parana and Paraguay, see PLATA (RIO DE LA). There is but one lake, that of Ypao, worth mention; extensive marshes, however, abound in the W. The climate is temperate, but damp. Paraguay, in point of fertility, forms a striking and favourable contrast to the adjacent parts of the Argentine republic. It is well wooded, and diversified with undulating hills and verdant vales. Mr. Robertson, who entered it at Neembucú, states, "I was glad to meet with much more frequent traces of cultivation and industry than were to be found in the solitary tracts over which I had heretofore sped my monotonous way. Whitewashed cottages often peeped from among the trees, and around them were considerable fields of the cotton, yucca, and tobacco plants. The Indian corn and sugar-cane were also frequently to be seen in the vicinity of the farm-houses of a better character than the cottages; and there was abundance of wood and of the prickly pear. With the latter, the cultivated country, as well as the potreros or paddocks, were invariably well fenced." (*Letters from Paraguay*, i. 256, 260.)

Almost half the entire territory is national property. It consists of pasturage lands and forests, which have never been granted to individuals, the estates of the Jesuit missions, and other religious corporations; and a great number of country houses and farming establishments confiscated by the late dictator. The latter paid great attention from the commencement of his reign to the improvement of agriculture, and to rendering the government property productive; and, by so doing, created a branch of revenue which, aided by time and a wise government, may be found sufficient of itself for all the wants of the state. He let a part of these lands at a very moderate rent, and for an unlimited period, under the single but indefinite condition, that they should be properly cultivated, or turned into pasturage. On other parts of these lands he established large farms, where thousands of cattle and horses are bred. These supply the cavalry with horses, and the troops with provisions; besides which, they also furnish great numbers of oxen for the consumption of the capital. For these the dictator required a high price, and would allow no one to undersell him. The farming establishments were objects of peculiar solicitude to him; and every month the master herdsmen were obliged to make a detailed report concerning them. (*Reugeter and Longchamp's Reign of Francia in Parag.*, 174-6.)

The arbitrary measures of Francia certainly produced a salutary result on farming economy at large throughout Paraguay. Before the establishment of his sway, the farmers never thought of cultivating any article beyond tobacco, the sugar-cane, and yucca-root; while the gathering of the maté or Paraguay tea engrossed almost all hands. In 1820, an extent of country, 80 leagues in circumference, was devastated by locusts, and a famine impended over the inhabs. To avert this, the dictator compelled the proprietors to sow a second time, a large portion of the land which had been laid waste, and the harvest that followed was most abundant. On the complete success of this experiment, Francia determined to extend his measures to the whole country, so that, ultimately, every farmer was under the necessity of employing himself in that particular branch of agriculture which the dictator pointed out! By these violent regulations, which, perhaps, were, at the outset, the best suited for the country, a total change in its rural economy was produced; it is no longer customary to import common necessities from Buenos Ayres and the adjacent provs. The migration of the rural pop. has been forbidden. Rice, maize, yucca, kitchen vegetables, are now cultivated on a more extended scale; and the growth of cotton, which had formerly been wholly received from Corrientes, suffices for the consumption. The breeding of horses and horned cattle has been equally encouraged; and instead of receiving cattle from Entre-Ríos, as previously, the farmers have now a surplus stock. The prohibition to interfere with the forests, and the total suspension of the intercourse between Paraguay and other countries, contributed very much to produce these results, as they turned to the cultivation of the soil all the industry which used to be applied to navigation, the cutting down of timber, and the collection of the yerba maté.

The latter, or Paraguay tea, is the leaf of the *Ilex Paraguensis*, an evergreen about the size of an orange-

tree, growing wild and in great abundance in the dense forests in the N. and E. provs. to which the natives resort in great numbers for its collection. It is difficult to penetrate the country where it is found; but the profits derived from the article are ample, Paraguay tea being in as general demand throughout La Plata, Chili, and many parts of Peru, as the teas of China are in Europe. Its collection is undertaken by merchants in Assumption, who each employ a master-workman or *abilitador*, and from about 20 to 50 peons, the master providing axes, knives, tobacco, mules, bulls for slaughter, and other provisions, with money advanced to him by the merchant. The boughs of the *yerba*, with the leaves attached, are first hewn down and scorched; the leaves being then roughly removed, and dried by being placed over a wide arch of wood work, underneath which a large fire is kindled; and, together with the small twigs, they are afterwards ground to powder by a rude wooden mill. The tea is next weighed and stored by the overseer, who pays the peons for it, at the rate of 2 rials or 1s. each arroba of 25 lbs. It is next rammed tightly into bags of bull's hide, which are left to dry in the sun, and contain from 200 lbs. to 220 lbs. each; and in this state it goes to market. Mr. Robertson estimates that for six months' work, the peon may obtain about 57l. in wages; but he has run in debt to his master perhaps 12l. before entering the woods, and as much more while employed there, for neither of which sums he has got half the value. Of the remaining balance of 33l., he spends perhaps 12l. in ornaments for his horse, 5l. more in personal decorations, and the rest in gambling, to which all are very much addicted. "In a month the peon re-sells his horse-furniture and personal apparel; and in a fortnight after that he is left without a farthing; and in a week more he is to be found again naked in the *yerbalés*." (*Robertson's Letters*, l. 134—150.)

Manufactures received a considerable impulse from the dictator's prohibition of foreign commerce. The people had previously imported cotton, woollen, and almost all other manufactured goods; and there used to be no such thing as a good workman in Paraguay. But the exercise of ingenuity was excited, not only by necessity, but by terror. The dictator caused a gibbet to be erected, and threatened a poor shoemaker to hang him up, because he had not made some belts of the size he required; and once he sentenced an unfortunate smith to hard labour, because he had improperly placed the sight of a cannon! (*Reugger, &c.* p. 50.)

Francía, next to personal aggrandizement, appears to have been actuated by the short-sighted, barbarous policy of wishing to render Paraguay dependent solely on her own internal resources, and wholly unconnected in any way with any other S. American state. Except in special cases, he permitted no ingress or egress of individuals or merchandise to or from Paraguay.* While Paraguay remained a Spanish prov., the yearly value of its exported produce fell little short of 1,500,000 dollars. 8,000,000 lbs. Paraguay tea were annually sent to Santa Fé and Buenos Ayres, besides 1,000,000 lbs. tobacco, large quantities of timber, cotton, sugar, molasses, spirits, &c. But the only trade, if so it may be called, which has been carried on of late years, was on account of the dictator. "When he wants an assortment of foreign goods, a permit is sent over to the adjoining prov. of Corrientes for a vessel to proceed to the opposite port of Neembucú. On her arrival there, the invoice of the cargo is immediately forwarded to him at Assumption, from which place, after selecting such articles as he requires, he orders a quantity of yerba-maté to be sent on board in payment. There is no appeal from his own valuation: no one is allowed to go on shore, and the ship is sent back as soon as the yerba is delivered. This article is in such demand, from his having stopped the trade in it, that the people of Corrientes are glad to get it upon his own terms. In the same manner, for a short period, he allowed a peddling traffic to be carried on between the Brazilian missions beyond the river Uruguay and the port of Ytapua, but that trade he altogether stopped about 10 years ago." (*Parish's Buenos Ayres, &c.*, 234, 235.)

The government of Paraguay is an anomaly in the present times. It approached under Francía as near to an absolute despotism as can well be conceived, the dictatorship of Sylla in ancient Rome being the only model with which it may be compared. The state is nominally republican, having a so styled congress of several hundred members; but the entire power centred in the dictator, who was not only commander-in chief, but head of the church, the law, and every other branch of the administration. The country is divided into 20 sections, or *commandancias*, exclusive of a territory in the S. E., called the Missions, occupying 600 sq. leagues, and governed by a special officer. Besides Assumption, the cap., there are but four towns in Paraguay; the other collections of houses being mere villages. There was no law save what was

* Francía retained Bonpland, the companion of Humboldt, without any just cause, in confinement in Paraguay for nine years!

dictated by the caprice of the dictator; and his punishments were as barbarous as his policy was tyrannical and oppressive. The military force comprised about 3,000 men, principally cavalry; besides which, there is a militia, comprising every free male citizen, 17 years of age, and capable of bearing arms. The naval force consists of only a few brigantines and gun-boats. The amount of the public revenue is uncertain: it is derived from state property, the greater part of which has been confiscated; tithes in kind upon all articles of produce, the right to levy which is sold each year to the best bidder; taxes upon shops and store-houses in the cap.; the *droit d'aubaine*, or right to the property of all foreigners dying in Paraguay; fines, postage, sale, stamp and commercial dues, &c. The principal state expenditure is for war-stores, and the support of the army. There is no public debt. Public education is not much encouraged; but there are many primary schools for male children, and, according to Reugger and Longchamps, "it is a rare occurrence in this country, where no printing-press exists, to find a free man who cannot read and write." Morals are at a very low ebb.

Paraguay was discovered in 1526 by Sebastian Cabot. The Jesuits afterwards established many missions in the S. part of the country; and were supposed to have effected astonishing improvements in the condition and habits of the natives; but no sooner had they been expelled in 1768, than the fabric they had been so long in raising fell straightway to pieces, and the Indians relapsed into their former barbarism. In 1776 Paraguay became a prov. of the viceroyalty of Buenos Ayres. In 1810, the Buenos Ayres revolutionary troops were defeated by the Paraguayans; but the latter soon afterwards deposed their governor, and in 1813, proclaimed Paraguay a republic under two consuls. In 1814 the second consul, Dr. Francía, found means to get himself made sole dictator for 3 years, and at the expiration of that term, for life. In 1826 Francía declared Paraguay independent, and its independence was formally recognised by the emperor of Brazil in 1827. In 1841, General Lopez, the present president, succeeded to Francía, and the oppressive policy of the latter has since been considerably modified. (*Robertson's Letters on Paraguay; Reugger and Longchamps; the Reign of Dr. Francía; Parish's Buenos Ayres, &c.*)

PARAMARIBO. See GUIANA (DUTCH).

PARGA, a fortified town and sea-port of European Turkey, in Albania, sanjack Delvino, on the Ionian Sea, near the mouth of the Fanar (an. *Acheron*), 48 m. S.W. Yannina, and 13 m. E. Paxo; lat. 39° 15' 45" N., long. 20° 24' E. Pop. 4,000. It is built amphitheatrically on the side of a steep rock, surrounded on three sides by the sea, the summit of which is crowned by an almost impregnable fortress, commanding a magnificent view of the surrounding coast and country. It is surrounded by strong walls, and has a double harbour. The streets are narrow, steep, and dirty; it has no public buildings of importance, and many of the houses are in ruins. The inhabs. export oil, tobacco, different kinds of fruit, and some tolerably good wine, all being the produce of the fertile and well-watered tracts surrounding the town. Sir J. C. Hobhouse states that the Pargiotes were among the worst of the Albanians, and that their connexion with the Christian states had taught them only the vices of civilisation without diminishing their ferocity. (*Albania and Turkey*, p. 169.) The opinions of General Campbell and Colonel Leake are much more favourable; and Colonel de Bosset, who had excellent opportunities of estimating their character, pronounced them to be spirited and independent, though at the same time temperate, docile, and, if well treated, easy of command. The Albanians, however, mostly withdrew from the town on its being ceded to Ali Pacha, and the present inhabs. are principally Turks.

Parga is hardly mentioned in history until 1401, when it entered into an alliance with Venice, which continued nearly four centuries, until the subversion of the latter in 1797. Parga, being independent of Ali Pacha, tyrant of Albania, afforded an asylum to refugees from his violence, and was the seat of frequent cabals against his government; so that it became an object of importance for him to annex it to his dominions. In 1814, it was besieged by Ali, but being assisted by the British in Corfu, Ali was obliged to give up the siege, and the Pargiotes had reason to believe that they would be incorporated with the republic of the Ionian Islands. The British government did not, however, agree to this arrangement: they felt the importance of Parga to Corfu; but the dread of continued dissensions with the Albanians led to a negotiation for its surrender, on Ali paying a pecuniary indemnity to such of the inhabs. as should refuse to remain after a change of government. In consequence of this agreement, which was severely, and perhaps justly, censured, most of the Pargiotes withdrew to the Ionian Islands; and Ali had to pay, in all, about 200,000l. by way of compensation. The cession took place in 1819.

old-fashioned judges and merchants, where the manners have been changed almost as little as the houses by the philosophy of the 18th century: here are no carriages, no equipages; all is still and silent; you are carried back to the customs of the grand hotels in the time of Louis XIII. Then there is the Faubourg St. Antoine, the residence of those immense masses that reigned under Robespierre, and which Napoleon, after Waterloo, refused to summon to his assistance. And behold the ancient city of Paris surrounded by the Seine, and filled by a vast and wretched population; there, proud amidst the sordid roofs around them, rise the splendid towers of Notre Dame, that temple of the 12th century which, in spite of the Madeleine, has not been surpassed in the 19th; there is the Hôtel-Dieu, the antique hospital as old as the time of Philip Augustus, and there is the Palais de Justice, where sat the parliament of Broussel, remarkable in the chronicle of De Retz!" (*France, Social, Lit. and Pol.* i. 44—47.)

Barrières, Boulevards, &c. — Paris, as defined by the walls erected in the reign of Louis XVI., is of an irregular oval shape, its greatest length from N. W. to S. E., being $4\frac{1}{2}$ m., and its greatest breadth from the Barrière de la Villette northward to the Barrière d'Enfer southward about $3\frac{1}{2}$ m. In these walls are 58 gates, at each of which is a toll-house for the collection of the *octrois*, or local dues on goods entering the city; and on the outer sides of the walls are well-planted walks, called "the outer boulevards," abounding with *guinguettes*, wine-shops, &c., the favourite resort of the lower orders, the wine drunk here not being subject to the town dues. Between the outer and the inner or great boulevards, already noticed, are the suburbs or *faubourgs*, forming some of the best built quarters of Paris.

General Condition of Streets, Houses, &c. — The streets in the interior of Paris, except those of more modern construction in the fashionable quarters N. W. the Tuileries, have been formed more or less on the model of the narrow lanes and alleys constructed before the general introduction of carriages, at a time when the absence of police and the frequency of popular tumults rendered it necessary to defend the streets at night with cross-barriers or chains. Much attention, however, and large sums of money, have lately been devoted to the improvements of the great thoroughfares; *trottoirs* of basaltic stone from Auvergne have been laid down in many of the streets; and more recently the asphalt-pavement has been successfully introduced in the Rue Rivoli and on the Boulevards. Gas has been provided by two or three chartered companies; and the quarters of the Tuileries, Chausée d'Antin, and Palais Royal, as well as the arcades and principal shops N. of the Seine, are now brilliantly lighted with gas. But in the streets of other quarters, and even in the best streets S. of the river, may still be seen the melancholy oil-lamps, or *reverberes*, suspended by a cord across the street, emitting only sufficient light to make darkness visible, till midnight, when all the lights are extinguished, and the town is plunged in obscurity, rendered more annoying and dangerous from the inefficiency of the night police. (*Mac-laren's Notes*, p. 22.) With respect to cleanliness, Paris, though greatly improved, is still very far from what it should be. The sewers, which were begun at the commencement of the 15th century, were at first wholly open, running through the middle of the streets, either directly into the Seine, or into its tributaries, the brook

Ménil-montant northward, and the Bièvre southward. In some of the closer and less wealthy districts this nuisance still remains; but by far the larger part of Paris is now supplied with subterraneous drains, arched with stone, some of them being of great size. Drainage, however, for separate houses, is still far from being common; there is a general want of water-closets; and domestic filth is in many cases allowed to accumulate, greatly to the injury of the public health, and in spite of police regulations, which, were they strictly enforced, might abate the nuisance. The houses, also, which are always five, and often seven, stories in height, though without cellars, consist, as in Edinburgh, of separate stories; and sometimes a single story, or floor, is divided into different sets of apartments, occupied by different individuals or families, the access to the different stories being from a common staircase, usually very dirty, and often, indeed, filthy to a degree revolting to an Englishman: and as water is seldom introduced into the houses by pipes, but is brought by porters from the public fountains in the streets, we need not be surprised at the deficiency of cleanliness. The more modern houses, however, are provided with better means for insuring this advantage; and in the new quarters we do not observe that *mélange* of inmates, from the prince *au premier* to the poor seamstress *au sixième*, that distinguishes the houses of Paris from those of most other capitals of Europe. The broader streets have externally a pleasing appearance, owing to the regularity of the houses, the great number of windows (for which there is scarcely any tax), and the general use of balconies and "external shutters called *persiennes*, formed of thin bars of wood, turning on hinges, and folding back on the walls when not in use." (*Mac-laren*, p. 28.) The streets S. of the Seine are gloomy and monotonous: in the chief hotels of the nobility few windows face the street, and large *porte-cochères* lead to an inner court-yard, round which the building is arranged.

Principal Streets, Places, and Parks. — The leading street of Paris, corresponding with the Strand or Oxford Street of London, is the Rue St. Honoré, running westward from the *Marché des Innocens*, and forming, with its continuation, the Rue Faubourg St. Honoré, a line of streets very nearly 2 m. in length. The houses in this faubourg are large and handsome, belonging chiefly to the higher classes; but those in the part nearer the centre of the city consist principally of shops and residences of persons in trade. The Rue St. Honoré is connected eastward with the Rue St. Antoine, terminating in the *Place de la Bastille*, in which is the model of the projected *Fontaine de l'Éléphante*. These streets entirely intersect the capital from W. N. W. to E. S. E., and the continuous line measured from the Barrière du Roule westward, to the Barrière du Trône eastward, is exactly 5 m. in length. From N. to S. runs another and almost equally important avenue, formed N. of the Seine by the Faubourg and Rue St. Martin, crossing the river and isle of Paris by two bridges (the *Pont Notre Dame* and *Petit Pont*), the part S. of the river consisting of the Rue and Faubourg St. Jacques, terminating in the Barrière d'Arcueil, from which to the N. end of the line at the Barrière de la Villette is a distance of $3\frac{1}{2}$ m. The Rue St. Denis runs parallel to the Rue St. Martin, connecting the Pont-au-Change with the N. Boulevards at the Porte St. Denis; and more westward, running in the same direction, are the Rue de Richelieu, Rue de Castiglione, and

Rue de la Paix connected with the *Place Vendôme*, the *Rue de Luxembourg*, and the *Rues Royale* and *Tronchet*, which run into the square containing the church of *La Madeleine*. These again are crossed by other streets running from W. to E., the principal being the *Rue St. Augustin*, which connects the Bourse with the *Boulevard des Capuchins*; and opposite to the Gardens of the Tuileries is the *Rue de Rivoli*, a noble well-paved street, lined on its N. side by government buildings and fine hotels: it is about $\frac{3}{4}$ m. in length; and lined throughout its whole extent with colonnades. The chief streets S. of the Seine and parallel to its banks are in the Faubourg St. Germain, comprising the *Rue de Grenelle*, a handsome avenue lined with several large and handsome government buildings, the *Rue St. Dominique*, *Rue de l'Université*, and *Rue de Bourbon*, the last running close to and in a line with the *Quai d'Orsay*. Most of the streets at the E. end of Paris are narrow and irregularly built: the *Quartier Latin*, S. of the Seine, comprises several collegiate edifices; but the streets are confined and crooked, in fact, little better than mere lanes and alleys. Indeed, the only handsome streets of Paris, except the Boulevards, are to the W. of the Palais Royal on both sides the river. The quarters of the Tuileries, the *Place Vendôme*, and the *Chaussée d'Antin*, are the most fashionable districts N. of the Seine; but the houses, or *hôtels*, of the higher classes are chiefly in the Faubourg St. Germain. Besides the streets just mentioned, Paris has about seventy squares, or *places*, the principal of which are—1. the *Place de la Concorde*, an open space W. of the garden of the Tuileries, in the centre of which is the obelisk brought from Luxor, in Egypt, 99 ft. 3 in. in height, inc. its pedestal; 2. the *Place Vendôme*, an octagon surrounded on three sides by handsome buildings, with Corinthian fronts, and having in its centre a noble column, formed on the model of that of Trajan at Rome, covered with bronze castings, representing the achievements of the grand army in 1805, and surmounted by a statue of Napoleon*; 3. the *Place des Victoires*, originally formed in 1685, and having in its centre an equestrian statue of Louis XIV. on a marble pedestal, with bas-reliefs; 4. the *Place de Grève*, where public executions were formerly carried into effect, and having on one side the *Hôtel de Ville*; 5. the *Parvis Notre Dame*, in front of the cathedral of that name, and having on its S. side the *Hôtel-Dieu*; and 6. the *Place de la Bastille*, in the Faubourg St. Antoine, occupying the site of the Bastille destroyed 14th July, 1789: in its centre is the *Colonne de Juillet*, a large Composite column, erected in commemoration of the revolution of 1830, 163 ft. in height, surmounted by a colossal figure of the Genius of France. Paris has also 65 fountains, communicating by pipes with the Seine and the Canal de l'Ourcq: some of them, as the fountains of St. Sulpice, St. Eustache, Grenelle, the *Château d'Eau* in the *Boulevard de Bondi*, and that in the *Marché des Innocens*, are worthy of notice from their architectural beauty; though the supply of water from them be not only insufficient, but of bad quality. In consequence of the great depth to which the *calcaire grossier* of the Paris basin penetrates, there are no springs in the city itself, though aqueducts bring pure water from a

distance; but pipes, leading as in London to each house, are of very modern date, and only partially introduced.

Exclusive of several handsome gates and barriers, Paris has four splendid triumphal arches; those of St. Denis and St. Martin in the N. Boulevards, erected in honour of Louis XIV.; the *Arc de Carrousel*, forming the principal entrance to the palace of the Tuileries, built in 1806 on the plan of that of Septimius Severus at Rome, being 60 ft. in width, by 45 ft. in height; and the *Arc de l'Etoile*, at the W. end of the *Avenue de Neuilly*, commenced by Napoleon in 1806, and completed by Louis Philippe. The latter is a most magnificent monument, and is, indeed, by far the most stupendous structure of the kind ever erected, either in ancient or modern times. It consists of a single arch 96 $\frac{1}{2}$ ft. in height, 48 ft. in width, and 73 ft. in depth, and of two smaller transverse arches; the whole structure being 147 ft. in length by 73 ft. in depth, and 162 $\frac{1}{2}$ ft. in height! It stands quite separate from any other building, so that it is seen to the best advantage. It has numerous colossal groups of sculpture, depicting most of the great battles gained by the French during the revolutionary war. The effect of this prodigious structure is grand in the extreme, and is worthy the genius and magnificence of its founder.

Contiguous to the *Arc de l'Etoile* is the garden of the Tuileries, an enclosed space of sixty-seven acres, laid out by the celebrated Le Nôtre in broad walks and angular beds, and profusely ornamented with vases, statues, &c. It is a favourite resort of the Parisians, and is separated by the *Place de la Concorde* from the *Champs Elysées*, an open space about 1,000 yds. in length by 400 yds. in breadth, planted by Colbert in 1670, with pavilions along the sides provided with seats and entertainments. These parks, for so they may be called, constitute with the *Avenue de Neuilly* the Hyde Park of Paris, and, like it, are thronged on Sundays and festival days. S. of the Seine is the *Champ de Mars*, an oblong space bordered by a double avenue of trees, and used for reviewing troops, horse-racing, &c. It was the scene of the celebrated *Fête de la Fédération*, 14th July, 1790, as well as of the *Champ de Mai* during the 100 days. Races are held in it in May and September; but English sportsmen describe them as very inferior. Several minor gardens are dispersed in the different faubourgs; besides which, near the E. and W. suburbs respectively, are the *Parc de Vincennes*, about 2 $\frac{1}{2}$ m. in length by 2 m. in breadth, and the *Bois de Boulogne*, a favourite resort of carriage company, as well as of duellists and suicides. Duels, however, have become much less frequent since the enactment of the law allowing damages to the family of the deceased party.

Palaces and Government Buildings.—Paris contains several palaces. The Louvre has not been the residence of a French monarch since the minority of Louis XV., and is now formed into a national museum and picture gallery. The Palais Royal, built by Cardinal Richelieu, and the favourite abode of Louis XIII. and Anne of Austria, consists principally of shops, cafés, restaurateurs, and *estaminets*, crowded at all times, day and night, by almost every class of the Parisians. The Palais du Luxembourg, built for Marie de Medicis, widow of Henry IV., was lately devoted to the use of the Chamber of Peers. The palace of the Tuileries, erected in the 16th century, on the site of a manufactory of tiles (*tuiles*, whence its name), was greatly

* This column was originally surmounted by a statue of Napoleon in his imperial robes. But after the arms of the allies had replaced the Bourbons on the throne, they threw down the statue, which was melted to form part of the horse of an equestrian statue of Henry IV. On the expulsion of the imbeciles who had made this miserable display of petty malignity, a fine statue of Napoleon in military costume was placed on the summit of the column.

enlarged by Henry IV., Louis XIII. and XIV. And additions have since been made to it by Napoleon and Louis Philippe, the latter having resided in it from his elevation to the throne till his expulsion on the 24th February, 1848. Its architecture is of a mixed character; but the earlier parts may be taken as a good specimen of the revived Italian style. Wings extend from the main building on the side towards the Place du Carrousel, one of which, on the S. side, connects it with the museum of the Louvre; and on the garden side are arcades extending through the central portion of the building, at the sides of which are handsome pavilions formed into state apartments, remarkable for their lofty windows, flanked by Corinthian pilasters. The general effect is extremely grand, especially on the garden side; but its grandeur results more from its great length and the variety of outline it presents, than from any excellence or congruity in the details. The state-rooms are on the first-floor, running the whole length of the garden-front, the principal being the *Salle du Conseil*; the state dining-room, known as the *Galerie de Diane*, from which other rooms lead to a vast saloon and state ball-room in the centre of the building, called the *Salle des Maréchaux*, adorned with portraits of the marshals of France, and unquestionably one of the finest rooms of the kind in Europe. The court of the Tuileries, on the E. side of the palace, was formed chiefly by Napoleon, and forms a wide space, separated by an iron railing from the *Place du Carrousel*, and now used for the inspection and review of the troops on duty in Paris. S. of the Place du Carrousel is the long gallery of the *Louvre*, connecting it with the Tuileries. The pictures are deposited in a splendid range of rooms on the first floor, facing the river, above $\frac{1}{2}$ m. in length; but nearly the whole interior of the palace, which forms a hollow square, is appropriated to the reception of museums, &c., which will be subsequently noticed. A portion of the basement story, however, in the S. wing, is divided into apartments for the residence of officers, attendants, &c. As respects its external architecture, the Louvre is undoubtedly one of the finest structures in Europe. Its E. front, facing the *Place du Louvre*, consists of a magnificent colonnade formed by 28 coupled Corinthian columns, rising above the basement story, and surmounted by a beautiful cornice and line of balustrades. The S., or river front, though much less ornamented, is still extremely handsome, being faced with 40 Corinthian pilasters, above which rise a balustrade and central pediment; the N. and W. fronts are quite plain, and form a striking contrast to those just described. The internal courtyard of the Louvre is a perfect square, each side being 400 ft. in length. The buildings surrounding it are of the Corinthian and Composite orders, highly adorned with sculpture. The *Palais Royal*, which stands to the N. of the mass of buildings just noticed, has towards the Rue St. Honoré a front with 2 wings, united by a screen which encloses a courtyard somewhat resembling the Horse Guards or Admiralty of London, not inelegant, though of a very impure style. Round the oblong space, at the back of the palace, the father of the late king of the French erected large houses and handsome colonnades, occupied by jewellers, tailors, *marchands-de-mode*, shoemakers, printsellers, *restaurants*, keepers of *cafés*, *estaminets*, or smoking-rooms, &c. The gardens are tastefully laid out, the whole being "brilliantly illuminated with gas; and

hence the Palais Royal is the perpetual rendez-vous of the idle and curious, as well as of the little *rentiers* of the capital. The *Palais du Luxembourg*, where, during the Republic, the Directory held its sittings, and which, on the re-establishment of the monarchy, was used by the Chamber of Peers, is a stately edifice, facing the *Rue de Vaugirard*, with 2 wings, connected by a screen and gateway; being remarkable for strength and solidity, as well as for the beauty of its proportions. The interior comprises several handsome apartments, the most interesting being the *Salle des Séances*, a semicircular chamber of no great size, round which are arranged chairs for the peers, while the flat side was occupied by the president's seat, and tables for clerks, &c. The gallery of the Luxembourg, which once boasted of a fine collection of old pictures, since removed to the Louvre, is now appropriated to the reception of works by living French artists; the gem of the modern gallery being "the bathing nymph," by Julien. The gardens behind the palace, laid out in the old French style, have a sheet of water in the centre. During the saturnalia that followed the revolution of 1848, the Luxembourg was the place of meeting of Louis Blanc and his socialist dupes. It is now appropriated to the meetings of different societies. Among the buildings devoted to the use of the government and legislature, the first place is due to the Palais Bourbon, now (1850) the *Palace of the National Assembly*. It was erected chiefly by the Prince of Condé, between 1722 and 1789, and it was occupied during the first revolution by the *Council of Five Hundred*. At the restoration of the Bourbons it was restored to the Condé family, with a proviso for the accommodation of the deputies in that portion of the building previously occupied by the Council; but the entire palace was subsequently purchased for the use of the legislature. The Corinthian portico fronting the *Pont Louis XVI.*, the pediment of which has lately been completed and exposed to public view, is of fine proportions; but, when compared with the building to which it is the entrance, it is much too large, and leads to no apartments of any great size, except the old Chamber of Deputies, a semicircular room ornamented with 20 Ionic columns of white marble, having gilt capitals. The president's chair and the tribune form the centre of the axis of the semicircle, round which rise successively the seats and desks of the deputies to the height of the basement supporting the columns. The walls are adorned with pictures and statues; and a spacious double gallery, capable of accommodating 700 persons, runs round the semicircular part of the chamber, fitted up with tribunes for high functionaries, the corps diplomatique, &c., and seats for the public. The existing legislative body does not, however, meet in this hall, but in a new and temporary hall constructed in the principal court of the palace. It is a plain building, without any pretension either to external or internal elegance. The hall is about 111 ft. in length by 88 ft. 6 in. in width. The place of each deputy is marked at the beginning and retained to the end of each session; but when a member addresses the assembly, he does not, as in the British H. of C., speak from his place, but ascends the tribune near the president's chair. The sittings are held chiefly by daylight. The library of the Legislature, a long and handsome gallery, contains about 60 000 vols., chiefly reports and law-books both French and English, including also a few rare MSS.

At the corner of the rue du Faubourg St. Honoré, is the *Palais de l'Elysée National*, now occupied by the President of the Republic. This palace has been the residence of a great variety of persons. It was built, in 1718, by Molet, for the Count d'Evreux. It was afterwards bought and occupied by Madame de Pompadour. At a later period it became the property and residence of Murat; and on his departure for Naples it was occasionally occupied by Napoleon, who was much attached to it. More recently it was inhabited by the Duke de Berry. And having become the property of the State, it is now, as previously stated, the residence of the president, Louis Napoleon. It contains some magnificent apartments. In one of these the emperor signed his last abdication.

Some of the government offices are extremely handsome edifices, especially the *Hôtel des Finances*, an insulated structure of vast size in the Rue Rivoli; and the *Hôtel du Quai d'Orsay*, a noble stone building, on the plan of the Farnese palace at Rome, and unquestionably one of the most magnificent in Paris, comprising about 800 rooms, divided into offices for the Council of State, the Cour des Comptes, and for the departments of the Interior and Public Instruction. The *Hôtel des Affaires Etrangères*, in the Rue des Capucines, is a building of considerable extent, but with few pretensions to architectural elegance. The *Hôtel des Monnaies*, or Mint, S. of the Seine, a little W. of the Pont Neuf, built in 1771, has 2 fronts, the principal of which facing the river, has a length of 300, with a height of 78 ft. All the operations of coining are carried on within this building; and it is the place of assay for all gold and silver articles made in Paris. In one of the apartments is a superb collection of medals and casts belonging to all æras of French history. Among other buildings nearly or more remotely connected with the government of Paris are the following: 1. The *Hôtel de Ville*, in the Place of the same name, commenced in 1549, but not completed till 1605, having a singularly uncouth front, with 2 side pavilions, higher than the rest of the edifice, and 2 gates leading to a quadrangle, in which is a bronze statue of Louis XIV. It comprises some fine apartments, particularly the *Grand Salle*, at one of the windows of which Lafayette, in 1830, introduced Louis Philippe to the populace as the best of Republicans! Its exterior is now undergoing extensive repairs. 2. The *Palais de Justice*, in the Isle du Palais, an edifice in a mixed style, erected between the 14th and 18th centuries, on the site of a still more ancient structure: in the interior a central staircase leads to a grand saloon, called the *Halle des Pas Perdus*, which comprises apartments for the Court of Cassation, the Cour Royale, and Cour d'Assize. 3. The *Hôtel de la Légion d'Honneur*, on the Quai d'Orsay.

Paris has 13 prisons. The model prison, or *Nouvelle Force*, rue de Mazas, recently constructed, is on a large scale, and is fitted up so as to carry out the solitary system to its farthest extent. It has 1,260 cells; and its arrangements, in regard to the security, the isolation and the *surveillance* of the prisoners, are said to be as perfect as can well be desired. Of the other prisons those of St. Pélagie and St. Lazare are the most extensive and best managed. The prison for juvenile offenders, in the Rue de la Roquette, is built on the *panopticon* principle. The *Abbaye*, so infamous in the annals of the revolution of 1789, is now exclusively employed for the detention of military offenders.

Religious Edifices.—The sacred buildings of

Paris, like those devoted to secular purposes, exhibit a great variety of styles; but from the close of the 16th century downwards, the Grecian has prevailed. The first place, however, both as respects antiquity and grandeur, must be ceded to the *Cathédrale de Notre Dame*, erected between 1010 and 1407: it is a cruciform structure, with an octagonal E. end, and double aisles surrounding the choir and nave; a third aisle also being occupied by a series of 7 external chapels. At the W. end are two lofty towers, evidently intended to have been the bases for steeples; but the tower usually seen at the intersection of the nave and transepts was destroyed during the revolution. The length of the church externally is 442 ft., the breadth 162 ft., and the length of transepts 352 ft.: the towers are 235 ft. high. The exterior, though not without beauty, is heavy, owing to the absence of steeples, pinnacles, &c., which give a light appearance to the majority of Gothic buildings. The W. front, however, with its 3 large gates and circular window, and the noble gateway on the W. side of the church, are highly worthy of admiration. The inside of the church has a very splendid and imposing appearance, owing to its numerous aisles and chapels; but the uniformity of effect has been entirely destroyed by the embellishments of the choir, which, though in themselves beautiful, are wholly unsuited to the rest of the building. The church of *St. Germain des Prés*, built about 50 years after Notre Dame, is cruciform, with a circular E. end. A considerable portion of the old building has gone to decay; and, out of three towers, only one remains; but the interior contains some good modern decorations, valuable pictures, old monuments, &c. There are 6 other churches, either wholly or in part of Gothic architecture; the most interesting of which is the church of *St. Germain l'Auxerrois*, not only from its structure, but from the fact that the signal was given from its belfry, on the 23rd August, 1572, for the detestable massacre of St. Barthélemi. Among the more modern churches in the Grecian style, the largest and most splendid is that of *St. Geneviève*, now called the *Panthéon*, in the quarter of the university. It was commenced in 1764 by Louis XV. The portico is composed of 22 fluted Corinthian columns, 60 ft. in height, supporting a triangular pediment 120 ft. broad by 24 ft. in height, in which is a sculptured composition, by David, representing the Genius of France (a colossal figure 14 ft. high), surrounded by the great men of the nation: on the frieze beneath is inscribed in gold letters—

“AUX GRANDS HOMMES, LA PATRIE RECONNOISSANTE.”

The plan of the church is a Greek or equilateral cross, the exterior having no windows, and being ornamented only by a frieze and cornice. In the interior a gallery and colonnade line the nave and transepts on both sides, forming so many smaller naves and aisles. Semicircular windows rise above the colonnades, throwing a strong light into all parts of the building; and from the centre of the cross rises a dome 282 ft. in height, the lower part of which is encircled by a Corinthian peristyle of 32 columns, each 36 ft. high. The inside is now perfectly empty, without any embellishments, except its architectural decorations; but it is intended that it shall be enriched with statues of Voltaire, Rousseau, Lagrange, and other illustrious individuals, whose remains have been deposited in the spacious vaults beneath the pavement. The total length of the Pantheon, including the portico, is 352 ft.; interior length from E. to W. 295 ft.; length of

transept 265 ft.; uniform breadth 104 ft. On the whole, this church is a work of great merit: the general proportions are good, and there is much grace and elegance in the outline, as well as grandeur and simplicity in the design; but it is by no means entitled, either from size or composition, to be compared with St. Paul's. Among the other churches, the most deservedly celebrated is the Madeleine, at the N. end of the Rue Royale, on the model of the Parthenon of Athens, but larger, being 328 ft. in length, and 138 in breadth, while its archetype is only 228 by 100 ft. It is altogether a very noble structure, and is remarkable for purity and elegance of design. The church of St. Vincent de Paul, opened in 1844, is one of the finest in Paris. It is a parallelogram 243 ft. by 108 ft. It has a fine portico, and two lofty square towers. Paris has, in all, twelve parish churches, corresponding with the arrondissements, and 90 district churches, besides others unattached, and several belonging to hospitals, convents, &c.; but none of these, except that attached to the *Hôpital des Invalides* (for which see *Hospitals*), requires any particular description. There are also several places of worship for dissenters from the Roman Catholic religion; comprising French Lutherans, Calvinists, and Independents; besides which, there are English churches and chapels, American chapels, Jews' synagogues, and a Greek church; but none of them have any claims to architectural beauty, except the church of the Visitation, in the Rue St. Antoine, and the Gothic church belonging to the British embassy, in the Rue d'Aguesseau. The Roman catholic clergy of Paris comprise an archbishop, 12 vicars-general, 3 metropolitan and 4 diocesan officials, 16 canons of Notre Dame, 34 honorary canons, with curés, and vicars to the different churches.* The Protestant clergy comprise Lutheran and Calvinist pastors, French independent ministers, an English bishop, with sundry English episcopal clergymen, and several ministers of other denominations. Paris still comprises several convents for females; but those of the present day bear but a very slight resemblance to the old nunneries; and are now little more than religious boarding schools for young ladies, or lodging-houses for the numerous *sœurs de charité*, who devote themselves to the nursing of the sick in the hospitals, &c. There are, also, numerous societies, some of which are liberally supported, for the promotion of religion at home and abroad, as well as of religious education.

Judging from the statements of the most intelligent travellers, it would seem, whatever may be the other wants of the French capital, that an increase of church accommodation is not one of them. "Had I not looked into the almanack, I should never have found out which day was Sunday. The churches are open every day, and of course afford no criterion. The shops are open too; carts and carriages are plying on the streets, and placards invite you to vaudevilles at the theatres and ballets at the opera. Your first impression is that Sunday has been blotted out of the French calendar. On closer inspection, you discover there is a difference between this day and the other days in the week, though I am sorry to say it is a small one. In making a circuit about 12 o'clock through the Palais Royal, the Rue Vivienne, Boulevard des Italiens, Rue de la Paix, and Rue Rivoli, I found about 1 shop in 20 shut or half shut. At 4 o'clock, on a shorter tour, I found about half of them shut,

* The curés in France are the incumbents of livings, the vicaires being the merely salaried servants of the curés, in the same way as the stipendiary curates of England are the dependents of the rectors and vicars, though protected by the bishop.

and at 6 o'clock, 3-4ths. The thoroughfare of carriages is perhaps also rather less, and that of loaded carts decidedly so. Some of the working classes, I understand, rest on Sunday, going to church perhaps in the morning, and in the evening to a theatre with their wives, or to a cheap café, and playing at dominoes.

"On Sunday-week I went to the once celebrated Café de Mille Colonnes, (now sunk to the character of an *estaminet*, or smoking-house,) to get a cup of coffee. It was about seven; I found two or three parties playing at billiards, and a score of little groups, of two, or three, or six individuals, busy with dominoes. Two of the parties near me consisted each of a man, with his wife and daughter. The greater proportion, however, of the working classes, ply their labours on Sunday till dinner-time, then rest in the afternoon; and that they may not want their holiday, go beyond the barriers, where wine is cheap, and spend the money in drinking and dancing. The over-rigid observance of the Sunday in Scotland, which sometimes disgusts young minds with religion altogether, is a light evil, when compared with this." (*Maclaren's Notes*, p. 17.)

Cemeteries. — The Parisians formerly interred their dead, like the ancient Romans, along the sides of the roads leading out of the city; but, as the pop. increased, and its boundaries were extended, these grave-yards became included within its precincts, and were at length almost in the centre of the town. They were, however, both few and small; so that the inhabs. were compelled to have recourse to other modes of interment; and, accordingly, large trenches (similar to those opened during the prevalence of the plague in London) were dug for the reception of corpses thrown in till the holes were filled, when they were covered over, and others opened close to them. This disgusting method of burying necessarily rendered the neighbourhood of these cemeteries extremely unhealthy; and at length government interfered to prohibit all funerals within the town, and ordered the formation of spacious cemeteries at a mile distance from the city walls, at the same time directing that the bones in the old grave-yards should be deposited in the subterraneous quarries or catacombs, under the Quartier St. Germain. Paris has now 5 large and well-laid-out cemeteries, similar in many respects to those which have since been formed on the same model near London, Liverpool, Lee's, and other large towns of England. The Père-la-Chaise, outside the E. barrier, is the finest of the Parisian cemeteries; and its advantageous situation on the slope of a hill, the number, as well as beauty, of its monuments, and the celebrity of many of those whose remains have been brought thither, make it one of the most interesting sights in the French metropolis. The Catacombs are very extensive, running under about $\frac{1}{3}$ part of Paris S. of the Seine: they are arranged into galleries lined with piles of bones, and the entrance is near the Barrière de l'Enfer; but, being deemed unsafe, they are no longer shown to visitors. (*Dulaure*, ix. 211—240.)

Hospitals and benevolent Institutions. — Hospitals for the relief of the sick, and *hospices* for the aged, infirm, or foundlings, existed in Paris from a very early period; but being exclusively under the direction of ecclesiastics, the objects of the founders were grossly perverted, and the revenues of these establishments applied to improper uses. No improvement took place till the revolution; when, by a decree of convention in 1793, the two old and only remaining hospitals were ordered to surrender a portion of the in-

mates of their crowded and unhealthy wards to the convents and other houses that had become national property. An administration, consisting of a general council and administrative committee, was formed in 1801, for the purpose of improving the condition of the public charities of Paris: a tax of 8 per cent. on the sums received at theatres and other places of public amusement; a tax on cemeteries; a portion of the *octrois* of the city of Paris, with dues from the *Mont de Piété*, &c., being, at the same time, affected for their support. These institutions have since increased in number and magnitude with the increasing pop. of the city; and, in 1849, some further measures were taken in the view of rendering their administration more efficient. In that year there were 16 hospitals and 13 *hospices*, or almshouses, in the city, having amongst them, inc. the foundling hospital, 17,702 beds. The outlay on these institutions, in 1848, inc. the foundling, and inc. also 1,920,795 fr. expended on out-door relief, amounted to 16,838,738 fr., or 678,550*l.* (*Annuaire de l'Economie Politique*, &c. for 1850, p. 274, &c.)

Of the hospitals, the *Hôtel Dieu* is entitled to the first notice, on account of its antiquity; for it is known to have existed in the middle of the 12th century, and, even at that early period, to have had some valuable endowments. It was enlarged between the reigns of Henry IV. and Louis XVI.; and since the revolution the buildings have been so much improved that at present the *Hôtel Dieu*, with its subordinate establishment in the *Rue de Faubourg St. Antoine*, has 850 beds: the average annual number of patients is 12,000; the mortality 1 in 8. It is in every respect extremely well appointed, and has among its medical officers the most celebrated physicians and surgeons of Paris: indeed, the *Hôtel Dieu* may be considered as the great normal hospital of France. The hospitals next in importance are those of *La Pitié*, *La Charité*, *St. Antoine*, *Bracon*, *des Enfants Malades*, and *des Vénériens*; the whole number of these establishments under the civil administration amounting to 16, exclusive of 3 military hospitals, regulated by the minister of war. These hospitals, however, are, with two or three exceptions, situated in close neighbourhoods, and from the antiquity of the buildings, ill-planned; but the interior management is extremely good, and may bear a comparison with that of the first London hospitals. Among the *hospices*, the principal are the *Bicêtre*, for infirm old men, the *Salpêtrière*, for aged women, 2 *hospices des incurables*, and 1 for orphans and foundlings. There are also numerous *maisons de santé* in and about Paris, which receive patients at certain fixed scales of payment, and may therefore be called hospitals for the middle classes. A great number of minor institutions for the relief of the sick and poor are supported by private subscription.

Crèches, or public nurseries, have been established in different parts of Paris. In these, the infants of poor women engaged in factories, or other out-of-doors labour, are received and attended to. The women deposit their infants in the *crèche*, in the morning when they go to their work, return to suckle them at certain hours, and carry them home in the evening. The *crèches* are sometimes wholly supported by public subscriptions; but occasionally those who carry their children to them contribute small sums to their support. A proposal is now on foot for introducing *crèches* into Manchester, for which, indeed, they seem to be peculiarly well suited. (See MANCHESTER.)

Of all the establishments, however, in the French capital devoted to the support of the aged and infirm, by far the most important, both on account of the grandeur of its buildings and the benefits which it confers on its inmates, is the *Hôtel des Invalides*, intended for the support of disabled officers and soldiers, or those who have been in active service upwards of 30 years. The edifice, situated at the S. end of an avenue leading over the Pont des Invalides from the Champs Elysées, and begun in 1675, is a conspicuous object from a distance on account of its gilded dome, lantern, and spire rising to a height of 323 ft. above the floor. It is composed of 5 courts of equal form and size, surrounded by buildings 5 stories in height, and covers a space of nearly 7 acres; and is, on

the whole, a very heavy building, without any exterior beauty. The church of the establishment is indebted for its noble appearance principally to its magnificent dome supported by 20 pairs of Composite pillars. Besides about 170 pensioned officers, there are about 2,000 sub-officers and privates, who are boarded, lodged, and clothed, and receive a monthly stipend varying according to rank. The dormitories contain each from 50 to 60 beds; besides which there are large infirmaries for the sick. All, except field-officers, mess at public tables, and all wear the same uniform. Their only duty is to mount guard within the precincts of the hotel; and, when the President comes within its walls, they have the exclusive privilege of guarding his person. On the whole, the *Hôtel des Invalides*, though by no means so fine a building as Greenwich Hospital, near London, is entitled to rank with it as one of the grandest national institutions of Europe. And it is now more than ever deserving of notice from its containing the remains and the magnificent mausoleum of Napoleon, perhaps the greatest general, and perhaps, also, the greatest man of modern times.

Commercial Establishments.—Paris, till 1826, though abounding with fine public edifices, had no structure specially devoted to the transacting of commercial business. The merchants previously met in the *Hôtel Mazarin*, and afterwards in the *Palais Royal*; but the inconvenience to which they were subject led, in 1808, to the formation of a plan for constructing an exchange sufficiently large for the multifarious business of so great a capital. The form of the *Bourse*, which stands in a spacious square at the E. end of the *Rue St. Augustin*, is a parallelogram, 212 ft. in length by 126 ft. in width, surrounded by a peristyle of 66 Corinthian columns. The *Salle de la Bourse*, or great hall, on the ground-floor of the building, 116 ft. in length by 76 ft. in breadth, is surrounded by arcades of Doric architecture. A grand staircase leads to a spacious gallery supported by Doric columns, and to the hall of the Tribunal of Commerce. Corridors run round both the upper and lower hall, communicating with various rooms devoted to commercial purposes: and on the whole the arrangements are of the most complete description. The hours for transacting business are from 1 to 5; but the galleries and corridors are open from 9 to 5. The *Banque de France*, erected by Mansard in 1720, possesses little architectural beauty. The present establishment was founded in 1803, and received the exclusive privilege for 40 years of issuing notes payable to bearer. Its capital consists of 91,250,000 francs in shares of 1,000 francs each. The notes issued are for 500 and 100 francs. The customary rate of discount varies according to circumstances, but averages 4 per cent.: the bank, however, discounts no bills that have more than three months to run. It opens, also, *comptes courants* with all requiring them, and charges no commission, its only remuneration for such transactions arising out of the use of money placed in its hands. The government of the bank is vested in a council of 20, elected by the 200 largest proprietors; the governor and deputy-governor are appointed by the president. The institution is flourishing, and enjoys unlimited credit. The public establishments connected with wholesale trade are called *halles*, the principal of which is the *Halle au Blé*, or corn-market, a circular building, completed in 1767. The *Halle aux Vins*, on the Quai St. Bernard, S. of the Seine, near the Jardin National, is an immense inclosure, having an area of 31,100 sq. yards, walled on three sides and fenced towards the quay by an iron railing about 850 yards in length. This great market is divided into streets called after the principal French wines; there are 7 in piles of buildings, four in front and three behind, one of which is fire-proof, and used solely as a store-house for spirits. The warehouses and vaults will contain 400,000 casks. Wines entering this *dépôt* are not charged with the octroi till taken out for consumption; but they pay one franc per cask for warehouse room, &c. The hall is open from 6 to 6 in summer, and from 7 to 5 in winter; and the counting-houses of some of the principal wine merchants are within the premises. The consumption of wine in Paris in 1849 amounted to 1,035,129 hectolitres, and of spirits to 51,910 hect. The other wholesale markets are the *Halle aux Draps* and the *Halle au Cuir*, the *Halle aux Vaux*, near the Quai de la Tournelle, being now exclusively used by the chiffonniers for the sale and exchange of rags, &c. The *Mont-de-Piété* of Paris is a government establishment, enjoying the exclusive privilege of lending money on moveable effects at the rate of 9 per cent. a year, or 4 per cent. a month. The money which it lends is borrowed from government at the rate of 3 per cent.; and the whole is under the management of a board of commissioners.

Markets, &c.—Paris has above 30 markets, the principal of which is that of St. Germain, opening on the *Rue de Seine*, and constructed from the designs of Blondel, which has served as a model for all the others since built. It is a parallelogram, 500 ft. in length by 480 ft.

in breadth. One of the most celebrated markets is the *Marché des Innocens*, in the centre of which, as already observed, is one of the noblest fountains in the capital: this, in fact, is the Covent Garden market of Paris, and has at least an equally fine and abundant show of fruit and vegetables; but connected with it, and in its immediate neighbourhood, are several other markets for fish, cheese, eggs, &c.; and indeed it may be termed a "quarter of markets." The *Marché du Vieux Linge* (old clothes market), built in 1809, partly on the site of the old *Temple* (the prison of Louis XVI. immediately prior to his execution), comprises four galleries containing 1,888 stalls or shops, in which are exhibited for sale all kinds of old clothes, shoes, iron, tools, &c.; and is, on the whole, not unlike the Rag Fair or Monmouth Street of London. The other markets are, generally speaking, commodious, but they require no particular description. Paris has, also, five *abattoirs* (built in consequence of a decree of Napoleon, 9th Feb. 1810), where the animals necessary for the consumption of its inhabitants are killed. The *abattoir* of Montmartre is about 1,074 ft. long and 384 ft. broad, and that of Ménil-montant is nearly as large; the other three (two of which are S. of the Seine) are inferior both in size and arrangement.

Internal consumption.—All estimates respecting the consumption of provisions in a populous city must, of course, be extremely vague; but, perhaps, with regard to Paris, there is less uncertainty, owing to the octrois or duties levied on most articles coming across the barrier. It is very difficult to form any estimate of the consumption of bread, on account of the permitted exportation of wheat into the neighbouring districts, whenever the price outside the barriers exceeds that of the *Halle au Blé*, but the daily consumption of flour is supposed to amount to about 1,800 sacks. Cattle, sheep, &c., chiefly come from Normandy, the Isle of France, and Limousin.

The authorities of Sceaux and Poissy, the two great cattle-markets of Paris, have published the returns of the sales of cattle effected in those towns during the year 1848. They consisted, for the two markets, of—

125,268 oxen, at an average price of	98c. per kilog.	
18,372 cows	89c.	
48,945 calves	1 fr. 21c.	
722,656 sheep	1 fr. 12c.	

At the above price it was estimated that each ox cost 352 fr.; cows, 186 fr.; calves, 82 fr.; and sheep, 22 fr. 50c.

The 125,268 oxen sold represented accordingly a sum of	Francs.
The 18,372 cows	44,129,536
The 48,945 calves	3,453,936
The 722,656 sheep	4,013,490
Total	16,559,805
	67,856,767

We subjoin an account of some of the principal articles consumed in Paris in 1849.

Wine	1,035,129 hect.	Sugar	7,562,607 kilog.
Spirits	51,910 —	Hay	6,306,782 bundles.
Cider and perry	9,072 —	Straw	9,252,218 —
Beer	76,187 —	Oats	770,155 hect.
Vinegar	17,774 —	Sea fish	5,158,006 fr. val.
Butchers' meat	52,165,406 kilog.	Oysters	1,604,671 —
Port	7,686,627 —	Fresh-water fish	561,348 —
Beverages, hams, &c.	713,704 —	Poultry and Game	10,501,430 —
Prepared meats	110,561 —	Butter	10,796,584 —
Cheese	1,279,446 —	Eggs	5,318,947 —
Grapes	3,393,638 —		
Bread	140,000,000 —		

N.B.—The consumption of almost every article was considerably greater in 1846 and 1847 than in 1848 and 1849, a consequence of the interruption of all sorts of industrious undertakings, and of the shock to credit, occasioned by the revolution of 1848.

Among other articles of consumption, the tobacco sold in Paris amounts to about 800,000 kilog. Fuel, which is here one of the most costly articles of domestic expenditure, consists principally of wood; but considerable quantities of coal and charcoal are also made use of.

Industry, Commerce, and Trade.—Paris, besides being the political cap. of France, is one of the chief seats of the national industry and commerce. Many branches of industry are conducted on an extensive scale; the advantages resulting from the greater subdivision of employment, the greater command of scientific assistance, and of skilled workmen, being more than sufficient to counterbalance the higher wages and heavier expenses in other respects attending their prosecution in so great a city. Still, however, it is ludicrous to suppose that a city like Paris, without coal, and without the command of water power, should ever be able to come into successful competition with such places as Manchester, Glasgow, or Birmingham. The articles produced in Paris are, in fact, chiefly those of virtue, jewellery, the fine arts, or those immediately ministering to the luxurious wants of a great capital. In these, however, a great

increase has taken place within the last 20 years. Two large manufacturing establs. belong to the government, and, like all similar establishments, are carried on at a heavy loss. One of these, the *Manufacture Nationale des Gobelins*, so called from the place where it is carried on having originally belonged to a family of the name of Gobelin, who amassed great wealth as dyers; but the property having changed hands, it was converted into an establishment for weaving tapestry; and, becoming celebrated for the beauty of its products, was purchased by Colbert for Louis XIV. in 1662, since which it has been a government monopoly. The pieces of tapestry are most exquisitely executed, and the effect of some of them is scarcely inferior to that of the best oil paintings. The manufacture of a single piece frequently occupies three or four years, costing from 15,000 to 18,000 francs. Some splendid carpets are likewise manufactured in this establishment. Its products are chiefly destined for the public palaces and public buildings, or for presents to monarchs and distinguished personages: a few of the inferior pieces of tapestry are allowed to be sold, but the sale of carpets is forbidden. A drawing-school is attached to the manufactory, and lectures are annually delivered by the most celebrated chemists on the chemical principles of dyeing. The national manufactory of tobacco is conducted on a very extensive scale, in a handsome modern structure on the *Quai des Invalides*. About a fifth part of the entire produce of tobacco in France is manufactured in this establishment. It employed in 1849 no fewer than 1,400 women, and 300 men. The manufactory of Sèvres porcelain, though about 6 m. from Paris, and not in the department of the Seine, may be noticed in this place: it has been the property of the state since 1759. Some of the articles furnished by this manufactory bring very high prices, and are esteemed alike for elegance of form, and the beauty and brilliancy of the paintings. An exhibition takes place in September, when there is an extensive show of foreign china and earthenware, as well as of specimens in different stages of progress. The *salon-dépôt*, in Paris, is in the *Rue Rivoli*. Among the other manufactures of the cap., jewellery, works in gold, silver, bronze, and steel, watchmaking, the manufacture of chemical products, hats, carpets, artificial flowers, and the compounding of all kinds of bonbons and sweetmeats, furnish employment to a vast number of persons; besides which, Paris has sundry woollen factories, employing upwards of 1,200 hands, and producing broad-cloth, cashmere shawls, *schallis*, flannels, &c., one establishment for weaving silk shawls, and above 20 factories for cotton or mixed goods of cotton and worsted. The manufacture of both silk and cotton stockings is likewise conducted on an extensive scale. With respect to the wages of workmen in Paris, there has been a considerable fall since the revolution of 1848: stone-cutters, carpenters, masons, &c., receive from 3 to 4 francs a day, and a few of those engaged in the more delicate branches of handicraft may earn from 5 to 6 francs per day of 12 hours. Those engaged in the cotton and woollen factories receive only from 1 to 2 fr. per diem, and work for 12 hours; and the wages of females, in whatever branch they are employed, scarcely exceeds that rate. Young women in shops receive their food, washing and lodging, with wages varying from 160 to 400 fr. a year. The expenses of living to these classes range between 17 and 28 sous a day, and lodging may cost about 100 fr. a year. The Parisian workmen scarcely ever work on Sunday, and they are quite as fond as those of London of keeping holiday on Monday, devoting both these days to amusements in the *guinguettes*, theatres, &c. A great number of workmen belong to benefit societies, of which there are about 170; and the moral condition of the labouring classes has been greatly improved by the establishment of fire and life insurance companies, savings' banks, infant and primary schools, as well as by the abolition of lotteries and gambling-houses.

Previously to the revolution of 1848, the Paris savings'-bank had nearly 80,000,000 fr. of deposits; but after the revolution the institution was compelled to stop payments. A law was afterwards passed providing for the funding of the deposits in a 5 per cent. stock at 80; but the subsequent fall in the funds again proved disastrous to the holders of *livrets*, and government found it necessary to come forward to their relief. In 1849, 15,542,274 fr. were paid into the bank by 173,029 depositors; the reimbursements during the same year amounted to 2,621,062 fr., paid to 18,066 holders of *livrets*.

The manufactures of Paris rapidly increased during the 20 years ending with 1847; and, though checked by the events of 1848, the increase still continues. The present (1850) value of those annually exported from Paris to foreign countries is estimated at about 80,000,000 fr., and that of those sent to the departments at about as much; making a grand total of 160,000,000 fr., or 6,400,000 sterling. We subjoin [see next col]

The retail trade of Paris is on a very extensive scale, and it is estimated that there are 6,500 retailers of food and drink, that 5,000 are employed in making and selling

An Account of the Number and Weight of the Packages, and of the Value of the Merchandise exported from Paris in each Year, from 1840 to 1847 both inclusive.

Years.	Packages.		Value.
	Number.	Weight.	
		<i>Kilogr.</i>	<i>Francs</i>
1840	177,757	15,347,177	134,005,000
1841	211,356	18,514,437	170,819,923
1842	182,208	15,224,195	137,078,492
1843	187,817	16,136,299	141,303,243
1844	196,248	17,195,216	168,801,628
1845	203,654	19,829,335	182,377,941
1846	203,851	18,862,584	165,139,281
1847	196,061	19,170,486	168,572,187

articles of dress or ornaments, 3,000 in building and furnishing houses, 850 in printing, publishing, and selling books, &c., 1,570 in trades connected with the fine arts, 350 in trades connected with mechanics, optics, &c., and about 650 in keeping hotels, restaurants, cafés, &c.; but these statements are all very vague, and not to be relied on. Above 50,000 tradesmen's licences are annually issued in Paris, producing about 9,000,000 fr. a year of revenue to government.

Paris has also 33 banking firms, 128 stock and insurance brokers, 1,350 doctors in medicine, 280 apothecaries, and about 400 persons keeping seminaries and pensions for children of both sexes.

Seine, Bridges, Quays, and Navigation.—Paris has not, like London, a deep broad river, navigable to the city by sea-borne vessels of large burden; but the Seine is, notwithstanding, a striking feature in Paris on account of its bridges and quays, as well as advantageous from its extensive boat-navigation. It enters Paris from the E.S.E. about 3½ m. below its junction with the Marne, at Charenton, and in its course forms a slight curve northward, its whole length from the *Barrière de la Rapée* at the E. end, to the *Barrière de la Grenelle* at its W. extremity, being 8,000 metres, or nearly 5 m., in which space it forms 3 islets, the smallest but highest up the stream being the *Isle Louvier*, used as a dépôt for wood-fuel, the Isle of St. Louis, about 700 yards in length, and the Isle du Palais, the site of the ancient *Lutetia*, about 5 furlongs in length by 2 do. in breadth. The river is crossed by 24 bridges, of which five are on the suspension plan, three of iron and stone, one of wood, and the rest of stone. These structures, though usually on a level with the quays, and on the whole convenient, will not bear to be compared with the bridges of Sta. Trinità at Florence, or St. Angelo at Rome, much less with the noble bridges crossing the Thames. "The Parisians," says Mr. Woods, "boast of their bridges, but without great reason: the *Pont d'Austerlitz* is fine for an iron bridge; the *Pont Neuf*, which crosses two branches of the Seine, and has 12 arches, has little pretension to beauty; the *Pont des Arts* is a light, not to say slight, construction of iron, for foot passengers; the *Pont Royal* is a well constructed stone bridge of 5 arches, but hardly a handsome one; the *Pont de la Concorde* is a stone structure of 5 very ugly-looking flat arches, and the *Pont de Jena* is a caricature of flattened elliptical arches, and apparent lightness, its entire merit being confined to some ingenuity in the construction in order to obtain this effect, which, nevertheless, is certainly a blemish." (*Letters of an Architect*, l. 22.) The islets in the river are connected with the N. and S. banks by 10 bridges, some of stone and others of wood, of inferior size and little beauty. The banks of the Seine are not blocked up, like those of the Thames, with coal-wharfs, warehouses, and irregularly built houses, running close down to the water's edge, but have five open quays, affording uninterrupted walks, extending on both sides the river from one end of the city to the other, Paris being in this respect greatly superior to London. Wharfs and landing-places are formed in different parts, particularly towards the E. end of the city. *Dépôts* for fire-wood are to be found along the river, and on all the outskirts of the town, and the boats along the wharfs on both sides the Isle du Palais furnish supplies of wood and charcoal. The navigation of the river is effected by large boats called *coches d'eau*, by barks, and within the last few years by steamers, the number of which is progressively increasing. From the higher parts of the river about 11,000 boats arrive every year with fruit, corn, and flour, hay, wine, paving-stones, bricks, &c., besides about 4,000 barks laden with timber, charcoal, and fire-wood. Barges of from 40 to 60 tons burden come from Rouen with colonial produce, cotton goods, cider, salt, foreign corn, &c., and steam-boats ply daily between Rouen and Paris, and others during summer between Paris and Montreuil. The river dues are light, and do not average more than 700,000 francs a year, exclusive of the octrois.

Canals and Railways.—The canals N. of the Seine consist of 2 or 3 branches connected with an undertaking for uniting the waters of the Seine and Ourcq, with the

view not only of making an inland navigation, but also of supplying the capital with water of better quality than that of the Seine. The Canal de l'Ourcq receives the waters of the Ourcq about 28 m. N.E. Paris, and after collecting several minor streams falls into a basin in the N. E. suburb of the city, from which branch several canals almost encircle the N. side of Paris. These canals, however, are less used for navigation than for supplying the city with water. Though inferior in respect of railway accommodation to London, Paris is now the terminus of several railways. Among others may be specified the line to Rouen and Havre; that to the Belgian frontier by Amiens, Arras, &c., with branch lines to Boulogne, Calais, &c.; the line to Rennes, by Versailles and Chartres; the Lyons line opened, in 1849, as far as Châlons-sur-Saône, &c.; and when the latter line has been carried to Marseilles, it will considerably shorten the overland route to India. The Orleans line has been continued to Tours, and is intended to be continued to Bordeaux. Other railways will, in all probability, be formed within a few years; and there is reason to hope that the country may, at no distant period, possess a large portion of the facility and speed of communication which distinguish England and Belgium from the other countries of Europe.

A curious statement has been published by authority, of the various carriages, horses, &c., belonging to Paris in 1849. We have deduced from it the following results, viz., Ordinary and supplementary hackney carriages 1,828, i.e. ordinary cabs 733, supplementary ditto 61; ordinary chariots 62, supplementary ditto 31; ordinary hackney coaches 847, and supplementary ditto 94. The job carriages are 3,000; omnibuses 400; carriages called *concoms* 28; stage carriages to the environs of Paris, and special carriages in connexion with railway stations 2,000; private cabs on two wheels 4,000; private carriages on four wheels 13,000; total of carriages circulating in Paris 24,256. Carts, tumbrils, drays, market carts, vans, trucks, &c., 25,000; water carriers' carts 1,000. The number of horses employed in Paris for all purposes is 24,000. The distance performed by each omnibus averages 16 leagues (40 m.) per day. They carry each, at an average, 150 passengers in the course of the day. The number of these omnibuses is 400; consequently the total number of persons conveyed in a day is 60,000, 1,800,000 in a month, and in a whole year 21,600,000.

Establishments for Education.—The university of Paris, which appears to have been established early in the 13th century, though some writers have traced its antiquity up to the time of Charlemagne, comprised, before the revolution of 1789, 10 great and 26 minor colleges, which had each faculties of divinity, law, physic, and arts. The professors appear to have been attached to colleges rather than to the university as an abstract body, and the number of students living in the colleges was very considerable. The revenue of the university arose out of a 28th part of the rent paid by the farmer-general of the royal posts and messageries, which, with the students' fees, made a large income; and the extensive buildings, still remaining, testify the importance once attached to these institutions, at the same time that the literary annals of France prove that, speaking generally, the various functionaries performed their duties pretty efficiently. At the revolution, however, the colleges were abolished, their estates confiscated, and the whole establishment was remodelled. Further alterations were made by Napoleon; but the present system dates from the restoration of the Bourbons. The university of Paris, as now constituted, is in fact the central establishment for education in France, and has under its direction all the faculties, colleges, and schools of the country: indeed, it may be considered as a mere government establishment, since the minister of public instruction is *ex-officio* rector of the university, which has jurisdiction over the five national and two private colleges of Paris, the college of Versailles, and all the *institutions* and *pensions* within certain limits. There are four faculties for higher degrees, granted by the Academic Council; but no students can be admitted to them without having previously taken the degree of bachelor of letters. Professors are attached to each faculty, and deliver gratuitous courses of lectures, a certain attendance on which, as well as other exercises, is necessary for obtaining degrees. Candidates for the degree of bachelor of letters must produce certificates of having studied at least one year in one of the colleges of the university, in some authorised *Institution*, or under the charge of a regular tutor. Examinations are publicly held four times a year under four professors appointed by the Academic Council: they include numerous oral questions on philosophy, literature, history, and the elements of mathematics, with papers for written composition, and the translation of Greek and Latin authors. The examination of each candidate must last 1½ hours, but may be protracted at the pleasure of the professors. All the higher degrees are granted only after severe trials, and numerous candidates are annually

reported. The number of regularly entered students in law amounted, at an average of the 5 years ending with 1866, to 3,416 a year. In 1868, there were about 1,500 students in the medical faculty. There are seven colleges in Paris, all of which have a certain number of attached hospitals, and receive tentiers as well as day-pupils. The following table contains the numbers and classes of the students in the different colleges in 1865-61

Colleges	Students	From Foreign Colleges	From Foreign Pupils	Total
College Louis le Grand	60	401	401	1,000
— de la Harpe	52	400	400	852
— de la Sorbonne	51	314	314	415
— de la Sorbonne	50	314	314	414
— de la Sorbonne	50	314	314	414
— de la Sorbonne	50	314	314	414
— de la Sorbonne	50	314	314	414
Total	313	1,380	1,380	2,013

At the end of each academic year, in August, a grand distribution of prizes takes place in the public hall of the Sorbonne in the most sumptuous paper of these colleges, and the degree of distinction thus ranked among more than 5,000 students is immense. The minister of public instruction presides at this ceremony, the professors deliver Latin orations, and the company comprises the most distinguished functionaries and laureates of France.

Paris, besides its colleges, has numerous institutions and pensions for boys, with corresponding institutions and pensions for girls. These are similar to all respects, except in size; the institutions being on a larger scale, and the course of study more general and more advanced in them than in the pensions. The conductors of these establishments must be at least graduates of letters, and are bound by law not only to follow the course of study prescribed by the university, but to send their pupils daily to one of the royal colleges in order to attend the professors' lectures. It is their duty also to assist them in their studies, and prepare them for the lessons to be given through in the public class-rooms of the colleges. All the permanent students of the colleges wear a military-looking uniform, and are summoned to their duties by beat of drum. There are no colleges for girls, and their education varies according to the system followed in each particular establishment; the minimum however of the different schools are obliged to pass an examination before passing authorized by the university (see the work entitled *Paris* pp. 1225-1230), and a valuable paper on the *Present State of superior Education in Paris* in the *Statistical Journal of London*, iv. 55-66.)

Among the other establishments for education, the highest is the College of France, founded by Francis I. in 1530, and augmented at different periods. It consists of professors only, called *lectures*, among which are some of the highest men in Paris. These lectures are gratuitous, and open to everybody. The museum of natural history in the Jardin des Plantes, has likewise an established corps of 13 professors, who deliver courses of lectures on different departments of natural history, chemistry, agriculture, &c. These lectures are, also, perfectly open and gratuitous, as are those delivered on Oriental languages, or arts, and on Connoissances of the globe since 1773-74, for citizens and pupils for 1 franc. 75 of war, but are left to modification.

In every branch of science are hired by government; and on students are admitted without having previously undergone an examination, to prove their competency in the classics and elementary mathematics. The pupils, of whom there have been about 300, study two semesters three years, and in one can enter the higher departments of the military service without a certificate of attendance at this establishment. The late king founded 50 scholarships, 15 of which are to the gift of the minister of war, 5 of the minister of the interior, and 4 of the minister of marine. The establishment is supported by government, but the pupils pay an annual sum for board and lodging. The mathematical education at this institution is excellent, and superior indeed to what it is in many other institutions of the same kind. Another example of great importance and credit connected with Paris, though not within the cap, is the *Museum Asiatique de St. Denis*, established by Napoleon, and furnishing an excellent education to between 500 and 700 young ladies, the daughters, sisters, and others

of members of the legion of honour; of whom 400 receive their instruction gratuitously. This institution is in every respect admirably conducted, and might serve as a model for a large college of London. It has, also, two married houses in which 600 pupils are gratuitously instructed. There are also several central schools, with lectures, &c., for the purpose of turning tentiers to the primary schools. The total primary schools in the departments of the Seine were attended, in 1866, by 4,000 pupils, and the primary schools for children were attended in 1866, by 15,000 boys and 11,000 girls, the expense of these establishments being estimated at more than half a million francs a year. There are 45 pensions, also, between 30 and 40 infant schools in Paris, supported by subscription, and attended by about 6,500 children.

Literary Institutions.—Among the many chartered and private literary societies of Paris, the highest place is due to the Institute, unquestionably the best establishment of the kind in Europe. A decree of the Convention, in 1793, abolished the old academy, including among others, the *Académie des Inscriptions et des Belles Lettres*, the most celebrated academic institution that ever existed. In 1795 however the Institute was revived, on the basis of uniting the literary and scientific academies into one body. In 1803, Napoleon divided the Institute into classes, and in 1833 a fifth was formed of moral and political sciences. The number members, of whom there are 317 receive pensions from government, ranging between 300 and 1,000 fr. a year besides whom there are 600 non-pensioners, 51 amateurs and 515 corresponding members. The magnificent building in which this learned body meets is on the Quai d'Orléans near the Pont Neuf. It was built at the close of the 17th century, after the designs of Leveau, at an expense of 2,000,000 fr., left by Cardinal Mazarin, who intended it should be a college for the natives of a province then recently annexed to the crown of France. The prior and rooms of the palace formerly used as a church, is now appropriated to the sitting of the different classes, and fitted up with benches forming a semicircle facing the president's chair. The Institute library comprises 100,000 printed vols. with 4,000 MSS. and the more recently formed library of the Institute has upwards of 100,000 vols. chiefly scientific works. At one end of this library is Pigeot's celebrated marble statue of Voltaire. The Institute is adorned with busts, bas-reliefs, &c., and this palace is, on the whole, one of the finest public edifices in Paris. The *Bureau des Longitudes* is another important public body, formed in 1795 for the discovery of the best methods of ascertaining the longitude, and for the general improvement of navigation; its meetings are held at the Observatory (near the Barrière d'Orléans) a building well suited for astronomical observations, and furnished with every description of philosophical instruments, and a good library of scientific works. The Bureau produces annually the scientific almanach, called the *Connaissance des Temps* for the use of navigators, and another work of a more general character, the *Annuaire du Bureau des Longitudes*. The Royal Academy of Medicine formed in 1774 and reconstituted in 1830 is charged with making reports to government on all matters of public health; this establishment, so definitively organized in 1834, consists of 175 residents, and 45 honorary members, with 50 foreign associates. The following are among the principal learned societies of Paris supported by private subscription:—

Literary, Museum, and Picture Galleries.—By far the most celebrated library of Paris, and probably the largest and most valuable that any where exists, is the *Bibliothèque Nationale* or National Library. This vast collection of books is deposited in the old Hôtel de Nevers, a long, independent building situate in the Rue Richelieu. It was begun in the middle of the 16th century, and at the death of Louis XIV. it had 70,000 vols. It was afterwards greatly increased by the addition of MSS. and printed books from the suppressed universities, and it is said to comprise as printed above 800,000 books and pamphlets, 10,000 MSS., 100,000 medals, 1,000,000 engravings, and 200,000 maps or plans, through there is reason to think that these numbers are in some measure considerably overestimated. It is open from 10 till 3 daily (except Sundays, and during a recess of six weeks in September and October) and every facility is given for literary research, except that the books may

be taken out only on certain public occasions and within of their premises.

not be removed from the building. Among the libraries attached to public establishments, the following are the largest:—That of St. Geneviève, comprising 200,000 printed vols. and 30,000 MSS.; the two libraries of the Institute, consisting together of 260,000 vols. and 4,500 MSS.; that of the Arsenal, 200,000 vols. and 6,300 MSS.; that of the Legislature, 50,000 vols.; that of the Louvre, late the private library of Louis Philippe, containing 85,000 vols.; and that of the Bibliothèque de la Ville, 60,000 vols., all open to the public. Paris has also several valuable museums, belonging either to the government or the university. The Museum of Natural History, in the *Jardin des Plantes*, may be said to stand at the head of every institution of the kind, not only in France, but elsewhere: it is conducted at an annual expense of 300,000 fr., and gives employment to upwards of 160 persons. The Botanic Garden, exclusive of a large collection of exotic plants from all climates, comprises buildings fitted up as dens for carnivorous animals, with menageries for foreign birds and beasts, which are all provided with habitations suitable to their modes of life. This collection of living animals, perhaps the largest in Europe, has enriched the museum with many new species, and enabled zoologists to improve the study of comparative physiology. Large additions to the *menagerie* have recently been made, and the collection is constantly on the increase. The Amphitheatre of Anatomy and Museum of Natural History occupy a large space at the end of the garden: on the first floor of the latter is a superb collection of reptiles and birds; the second floor is devoted to the reception of mammalia, birds, insects, mollusca, &c., arranged according to the system of Cuvier (who here pursued those studies that have gained him an imperishable fame); and on the third story is arranged a general herbal, comprising upwards of 50,000 species, besides special collections amassed by Tournefort, Jussieu, Humboldt, Decandolle, &c., the entire number of specimens amounting to nearly 400,000. Along the E. side of the garden runs a long gallery, in which is deposited a noble museum of geology and mineralogy, only recently formed, and even now second to none in Europe. The Museum of Comparative Anatomy is kept in a detached building W. of the garden; and the number of preparations, which fill 15 rooms, considerably exceeds 15,000. The menagerie is open every day; and the museums may be seen by tickets twice or three times a week. Paris has many minor collections of anatomy, mineralogy, &c., attached to the School of Medicine, and to its numerous literary societies; but none of them are sufficiently extensive to require description. The *Conservatoire des Arts et des Métiers*, in the Rue St. Martin, deserves notice, both on account of its great extent and the astonishing variety of instruments and machines, specimens of manufacture, models of patents, &c., deposited therein; in fact, this gallery of practical science is one of the most interesting exhibitions in Paris; and having been re-arranged and catalogued, may now be seen to great advantage. It is open during two days in the week; but the library is accessible 7 or 8 hours a day.

The great glory of Paris, however, as respects the fine arts, is the gallery of the Louvre, comprising a most extensive and valuable collection of pictures and statues. During the latter years of the reign of Napoleon, this gallery was the richest and most magnificent by far of any that has ever existed, having then to boast of the *chef-d'œuvre* of Rome, Florence, and, in fact, of the greater part of continental Europe, carried off by the conquering legions of France. But victory having deserted the eagles of Napoleon, these treasures were again restored to their former possessors, and the Louvre has no longer to glory in the Apollo Belvidere, the Venus de Medici, and other matchless productions. Still, however, the collection is a very noble one. Eighteen large halls, on the ground-floor, are filled with pieces of sculpture, including the choicest treasures of the Villa-Borghese, and many works that once embellished ancient Rome. Many of them are of great value; especially the *Diane à la Biche*, standing on a pedestal adorned with most exquisite bas-reliefs; a statue of Mars, supposed to have been modelled from a picture by Zeuxis, once in the temple of Concord at Rome; the celebrated Fighting Gladiator, by Agasias of Ephesus; the Hermaphrodite of the Villa-Borghese: a statue of Jason, erroneously called Cincinnatus; and the magnificent group of Silenus and the infant Bacchus discovered in the garden of Sallust at Pompeii. Five other rooms in the basement story are devoted to the reception of works by modern sculptors; a large apartment was filled in 1830 with a collection of Egyptian antiquities, and a large gallery has since been opened, called the *Musée de la Marine*, comprising models and sections of vessels, plans of ports, and other naval curiosities. The great picture gallery, which is on the first floor, is approached by a grand staircase painted by native artists, and comprises a suite of nine apartments, the walls of which are lined by upwards of 1,200 pictures by artists belonging to the French, Flemish and Dutch, Italian and Spanish schools.

Among the pictures of the French school are 15 admirable landscapes by Claude, the best of which is the well-known "Disembarkation of Cleopatra;" 16 compositions, chiefly scriptural, by N. Poussin, among which may be distinguished an "Assumption" and "Holy Family;" and 17 beautifully coloured marine paintings by Vernet. Among the Flemish and Dutch pictures, which, like those of the French school, occupy three apartments, the most distinguished specimens are Gerard Dow's "Droptical Woman;" several pictures by the Vandycks, particularly a sketch of the "Dead Saviour in the Virgin's arms;" 14 fine studies by Rembrandt, including his "Venus and Cupid;" and 38 pictures by Rubens, the principal of which are, the "Flight into Egypt," and a composition known to connoisseurs as the *Vierge aux Anges*. The schools of Italy and Spain occupy the three remaining apartments, which, indeed, contain the gems of the gallery. The following have been specified as those more particularly entitled to notice:—Raphael's "*Belle Jardinière*," and Holy Family, painted for Francis I., who paid for it upwards of 45,000 francs; Leonardo da Vinci's portrait of "Mona-lisa;" Correggio's group of "Jupiter and Antiope;" Domenichino's "St. Cecilia;" Guido's "Infant Saviour on the Virgin's knee;" Guercino's "Repentance of St. Peter;" a magnificent battle-piece, and the "Witch of Endor," by Salvator Rosa; Murillo's "Infant Jesus;" and Espagnoletto's "Adoration of the Shepherds."

The Louvre is open every day except Mondays, and on Sundays the concourse of visitors is particularly great. Owing to the want of room, the pictures of the ancient masters are removed from the Grand Gallery, or are covered over, from the 1st of Feb. to June, to make way for the annual exhibition of the works of the modern artists! This arrangement has been much objected to, and is, perhaps, the most defective of any connected with the fine arts in Paris. It is to be hoped that it may speedily be obviated, by providing some other place for the modern exhibition. The French metropolis comprises several valuable private collections, especially that of Marshal Soult, which has some fine specimens of the Spanish school: the gallery of the Palais Royal consists chiefly of works by modern artists.

Literature and Periodical Press.—Paris is the great centre from which emanates all the most important publications of France, and in which is congregated all the most distinguished French writers. The increase of publications appears to have been regularly progressive from 1817. And within the last 20 years a vast number of highly important and valuable new works, especially in history, philosophy, and science, have issued from the French press, as well as several republications of old standard works. These large undertakings are mostly conducted at the expense and risk, not of one, but of several publishers, on a joint stock principle. The periodical press of Paris is extremely extensive, is well conducted, and has great influence. The "*Moniteur Universel*" is the official morning journal of the government. "*Galignani's Messenger*," a well-conducted daily paper, in English, is extensively circulated in the principal cities and towns of continental Europe. The national printing-office employs about 400 workmen. The censorship of the press, which was early introduced, and was exercised, though with considerable indulgence, down to the revolution of 1789, was finally abolished after the revolution of 1830.

Theatres and other Amusements.—Paris may be regarded as the dramatic capital of Europe. Every Parisian, even of the lowest class, esteems himself, more or less, a critic of the drama; and the fondness for this species of entertainments makes the theatres be almost nightly crowded to excess: indeed, the receipts of the theatres have for some years been steadily on the increase, and lately amounted to about 9,000,000 fr. a year, of which a tenth goes to the support of public hospitals and charities. The most fashionable spectacles of Paris are the Italian and French operas. The former of these, in the Salle Ventadour, is confined to the representation of Italian operas, and its administration for many years has secured an almost unprecedented amount both of vocal and instrumental talent. The French opera house, belonging to the *Académie Nationale de Musique*, is partly supported by the government; the operas are represented by the pupils of the academy, the dancers in the ballet are the first in Europe, and the stage mechanism is brought to perfection. These theatres are supported chiefly by the higher classes, and as fashionable resorts may be considered analogous to the Italian opera in London. The other theatres, five or six of which are nightly crowded almost to suffocation, are supported by the middle classes, the small *rentiers*, and wealthy tradespeople. Vaudevilles and musical farces are the most popular entertainments; but among the lower classes frequenting the Porte St. Martin and Ambigu Comique, there is a marked predilection for the horrible, as depicted by Victor Hugo, Dumas, &c. The following is a list of the principal theatres now open in Paris:—

scene of the tumult of the *Frondeurs*, supported by the inhabs., against the French and Swiss guards; but notwithstanding these disturbances, the city still increased, churches, convents, and hospitals were built, the palace of the Tuileries was finished, the quays and boulevards were laid out, sewers formed, and other improvements effected at a great expense. The most memorable scenes connected with the history of the French Revolution, from the destruction of the Bastille, in 1789, to the assumption of imperial power by Napoleon, were enacted in the metropolis, which has long had a preponderating, though not always a beneficial influence, over the affairs of the kingdom. Under the government of Napoleon, Paris was greatly improved, and many of those scientific and other establishments were either formed or remodelled, which have contributed to increase its literary and scientific renown. The work of improvement proceeded slowly during the reign of Louis XVIII. and Charles X.; but, since the revolution of 1830, which placed Louis Philippe on the throne, great activity has been evinced by the legislature in raising solid as well as splendid monuments, some of which, as the Madeleine, the Arc de l'Etoile, and the ministerial hotel on the Quai d'Orsay, may vie in magnificence with the finest European structures. At the same time, new pavements, bridges, sewers, markets, public gardens, and prisons, attest that no department of the metropolis has been neglected by the government; and whenever gas has been generally diffused, and water-closets, which, at present, are shamefully deficient, have been universally introduced into private houses, Paris will be one of the most comfortable as well as handsomest and most luxurious capitals of Europe. (*Dulaure, Histoire de Paris; Paris and its Historical Scenes*, l.; *Galignani's New Paris Guide*, &c.; and *Private Information*.)

PARMA (DUCHY OF), an indep. state of N. Italy, between lat. 44° 20' and 45° 8' N., and long. 9° 20' and 10° 30' E. (exc. the detached distr. Guastalla), having N. Austrian Italy, from which it is separated by the Po, W. the Sardinian dom., S. the latter and Tuscan Lunigiana, and E. Modena. Area estimated at 2,268 sq. m. Pop., in 1850, 494,737. This duchy, lying between the Po on the N., and the Apennines on the S., is partly and principally included in the great plain of Lombardy; but a large portion of its surface is covered with the ramifications and slope of the Apennines, the crest of the ridge, here about 4,000 ft. in height, forming its S. boundary. It slopes to the N., and all its rivers fall into the Po. The soil, which is very fertile in the plain, where it is watered by numerous canals, is stony and arid in the mountainous districts. It is principally held by metayers; but while in the surrounding states such agreements are entered into between the metayer and his landlord as they may approve, in this duchy the law interposes to protect the tenant, who might be inclined to subscribe to peculiarly onerous conditions. Thus, a landlord may stipulate for more than half, but not for more than 2-3ds of the produce. If the landlord furnish the cattle, the farmer has a right to, at least, 1-3d of the profit thence arising; and if the tenant furnish the cattle, no lease is binding that does not leave him 2-3ds the produce. (*Von Raumer, Italy*, l. 307, 308.) Along the Po, the further we advance to the E., the soil becomes deeper, richer, better watered, and more fertile. The dairy is here the great object of attention, and the famous cheese which derives its name from this duchy is still made to a great extent in the neighbourhood of Pavia, Lodi, &c. Farms are very small, and the husbandry inferior to that of Modena.

The acorns of the numerous oaks, along the banks of the Po, feed an immense number of hogs, which are generally preferred to those of any other part of Italy: in consequence many are sent to Tuscany and the Papal States, whither, also, and to Genoa, great numbers of fat oxen are sent. The sheep of the duchy are indifferent: the superior flocks pastured in the Parmese Apennines in summer, belong to Lombardy, Tuscany, and other adjacent states. Both poultry and bees are abundant. Maise, wheat, beans, tobacco, fruit and wine, are the principal products of the plain country. The only raw materials manufactured are silk and hemp; but, according to Serristori, the produce of the former only amounts to 100,000 lbs. a year. Rice is grown in the district of Guastalla, and near Parma. In the mountains but little corn is grown; and the climate is too cold for the vine. Chestnuts and skimmed milk, with cheese made from the milk of goats and ewes, form the principal food of the population. Potatoes were not introduced into the mountain districts when the duchy was visited by Châteaueux. The inhabitants of these districts make a good deal of charcoal; but their principal revenue is derived from their migrations: for all the active inhabitants quit their homes at the favourable season, to work in Lombardy and Tuscany. The money they gain and save from this source forms almost all the capital circulating among them.

Iron, copper, vitriol, and petroleum, are found in the

mountains; but the principal mineral product is salt, of which about 12,300 quintals are made annually. Manufactures, excepting such as are domestic, are of trifling importance; silk fabrics are the principal, and are made in all the larger towns. There are several iron forges; and hats, glass, earthenware, paper, and gunpowder are made in Parma, Piacenza, and San Donnino. The value of the imports, which consist mostly of woollen and linen cloths, colonial goods, and articles of luxury, is estimated at 800,000 *lire*: while the value of the exports, including 8,000 head of cattle, and 27,000 hogs, has been estimated at under 200,000 *lire* a year. (*Serristori, Statist.*) But it is hardly necessary to say that there can, in fact, be no such discrepancy between them; and either the one statement or the other, or perhaps both, must be completely erroneous.

The government is an unlimited monarchy, hereditary in the male line. This duchy was assigned, by the treaty of Vienna, to the Archduchess Maria Louisa, ex-empress of France. At her death, however, in 1847, it fell, according to previous arrangements, to the Duke of Lucca, or his heirs, who, on his part, ceded Lucca to Tuscany. The administration is conducted by a cabinet of six ministers. The duchy is divided into five districts: chief towns, Parma, the cap., Piacenza, Borgo San Donnino, Borgo Taro, and Guastalla. There are 38 inferior courts of arbitration, consisting of a single judge, and courts of primary jurisdiction and appeal in Parma and Piacenza. Criminal trials take place in public, but without the intervention of a jury: the judges composing the court decide by a majority of votes. The code of Parma, promulgated since 1820, is bottomed upon the Code Napoleon, but has much that is peculiar to itself. Secret societies are prohibited, and associations for definite objects, if consisting of more than 20 members, require to be authorised by government. All games of chance are prohibited, under penalty of fine and imprisonment. Public provision is made for the poor; and beggars are either punished with imprisonment, or sent to a workhouse. If death ensue from a duel, the challenger is liable to imprisonment for from 10 to 20 years, and the challenged from 8 to 10. (*Von Raumer*, l. 314—316.) The Rom. Cath. is the state religion; but others are tolerated. Public instruction is furnished by about 380 elementary schools, attended by nearly 10,000 pupils; there are also secondary schools in most of the towns; and superior academies in Parma and Piacenza. The military force consists of about 3,000 men, chiefly infantry. The public revenue, derived from state property, territorial and personal taxes, patents, custom duties, *octrois*, &c., amounted, in 1849, to 8,871,685 *lire*.

This territory anciently formed part of Cisalpine Gaul. Charlemagne gave it to the Holy See; but during the quarrels between the popes and the emperors, Parma and Piacenza became independent republics. They afterwards fell successively under the dukes of Milan, the popes, the Farnese family, and the Spaniards. By far the most celebrated of its native sovereigns was the famous Alexander Farnese. Though he served one of the most odious tyrants, Phillip II., Farnese was alike generous and brave, and was certainly the most skilful and accomplished general of his age. In 1801, Parma was ceded to the French; and in 1806, it was principally included in the dep. Taro, belonging to the kingd. of Italy.

PARMA, a city of N. Italy, the cap. of the above duchy, on the little river of its own name, a tributary of the Po, here crossed by 3 bridges, 35 m. S.E. Piacenza, and 33 m. S.W. Mantua; lat. 44° 48' 1" N., long. 10° 26' 45" E. Pop. circa 36,000. Its walls are between 3 m. and 4 m. in circ.; it is surrounded by a glacis which forms a favourite public promenade. It is well built and laid out, especially its principal thoroughfare, which forms a part of the Flaminian way (via Flaminia). It has many good public and private edifices; they are mostly, however, of brick, and none is remarkable for beauty; many of them are, also, in a decaying condition, and its streets are "dull and dreary." The Farnese palace, though an immense pile, is little more than half the original design; it is raised on open arcades; and, though partly in a ruinous state, it served for the residence of the late archduchess, and accommodated the academy of arts. In the new picture gallery belonging to the latter are several masterpieces by Correggio, Parmegiano, Raphael, the Carracci, &c. The academy has also a museum, in which are many interesting antiquities from the buried city of Velleia (18 m. S. Piacenza), and an extensive and well-arranged library. Attached to the palace is the large Farnese theatre, designed by Vignola on the model of the ancient theatres, 300 ft. in length, and capable of accommodating some thousand persons. It is built entirely of wood, and is well constructed for hearing; but it has been long disused, and is said to be in a very dilapidated and ruinous state. Another, but smaller theatre, exists on the same floor; and a third, built by the late archduchess, was finished in 1830.

The cathedral, an edifice of the 11th century, though in a mixed and semi-barbarous style, is, on the whole, a

magnificent building. Its two domes is ornamented with one of the best and most celebrated productions of Correggio. The city has a great number of other churches, several of which possess some fine works of art. It is a bishop's see, and a seat of the high court of revision for the duchy, besides several inferior courts, and was, till 1875, the seat of a university. It has now a superior school of divinity, medicine, and philosophy, attended by about 400 students, a college of nobles, founded in 1688, an episcopal seminary, some inferior schools, and several hospitals and other charities. The principal and most extensive establishment in the city is the famous printing office of the Bodoni, established in 1765. It has produced some of the best specimens of typography especially some of the most splendid editions of the classics of which modern Europe has to boast. The city is supplied with water by a conduit, said to be 30 m. (?) in length. The *Palazzo Ducale*, and a large public library, are situated without the walls. Farms has some oaks and other timber, but its manufactures and commerce are comparatively insignificant.

Paraná became a Roman colony in 400 B.C. It suffered greatly in the civil war between Antony and Augustus; and was colonized anew by the latter, from whom it received the name of *Julia Augusta Colonia*. It was anciently much celebrated for its wood.

PARWANSUS, a mountain-chain of Independent Greece, prov E. Helles, and near Phocis, famous in Grecian poetry and mythology, the favourite resort of Apollo and the muses, and especially sacred to Demeter. It runs from W N W to E S E., forming the connecting link between Mount Pindus and Mount Helicon; but the only part of it that requires any particular mention is its commanding point N. of Delphi, now called *Lefkissa*, lat 39° 51' N. E. long 20° 30' E.

helms territory; it was covered with snow, even the lower ridges not being destitute of it. We looked down on Achaea, Argolis, Elis, and Arcadia, as upon a model. The higher region of the mountains is of limestone, bleak and destitute of all herbage except a few alpine plants (Trauer, v. l. 261). From the sacred town and temple of Delphi the mountain appears to have two summits, one of which was sacred to Phoebus and one to Neptunus —

* ——— Forecasts given with other info.
 Main Point Forecasts only. Source: p. 72.

Running down the cleft between these two stupends is the famous *Pons Caelatus*, the genuine source of poetical inspiration. It is thus alluded to by Virgil, in connection with the neighbouring mountains —

²² See the President's decision per *certiorari* denied. *Reagan v. Shaw*. Just as Justice, and with reference. *Constitution* must determine which side.

Even at present it is by no means unworthy its ancient renown. Mr. Dedwell says, "it is clear, and serves as excellent beverage. The fountain is ornamented with pendant ivy, and overshadowed by a large fig tree." Higher up the mountain is the Corycian cave, which, during the Persian war afforded a safe retreat to the lone adventurous Greeks after the battle of Thermopylae (*Hervé*, vol. 24.) It is described by Mr. Raikes, the first modern traveller who has visited it as a chamber 200 ft. in length, and nearly 100 ft. in breadth, with a roof studded with stalactites. Above this cave, and at a distance of about 60 stadia from Delphi, stood the town of Tithorea, taken and burnt by the army of Xerxes at the close of the Persian war. The ruins were found by Dr. Clarke, near the modern village of Pefthos. For further particulars see *Demos*.

PAROS, a famous island of the Greek Archipelago, group of the central Cyclades, to the W of Naxos, from which it is separated by a strait, 5 m. across. (Mount Mt. Elia, the most elevated point in the island, being to lat. $37^{\circ} 2' 48''$ N., long. $25^{\circ} 11' 25''$ E. Pop. 8,000.) It is oval-shaped, being about 12 m. in length by 8 in breadth. Though rugged and uneven, it is, speaking generally, extremely fertile, and, if well cultivated, would support four or five times its present pop. It produces considerable quantities of cotton, with corn, wine, oil, &c. Teyssier says that the butchers' meat is good, that there are a great number of hags, and that pigeons and partridges are extremely abundant. (1828, &c. &c.) Port Naxos, on the N. E. coast of the island, is one of the best harbours in the Archipelago, and was used, in 1778, as the rendezvous of the Russian fleet. Paroschia, on the site of the ancient city of Paros, on the W. coast of the island, is the capital. Its harbour is open to the W., and there are some unbroken rocks in its vicinity, on one of which the *Superte*, a French line-of-battle ship, was lost, in 1823. The present town consists of mean houses, which, however, are interesting from their chiefly consisting of fragments of the old city, including portions of the shafts and capitals of columns, &c. the cathedral church is said to be the best in the Archipelago.

Paros was famous in antiquity for its beautiful snow-white marble, whence Virgil has called the island *albom Paros* (*Aeneid* III. v. 124). The finest of the ancient statues, including the Venus de Medici, the Apollo Belvidere, and the Antinous, were formed out of this material. Indeed, the best sculptures used no other, even *marbre tantum candido marmore non sunt a Paro parvis*. (Palm. *Hist. Nat.*, lib. xxiiv cap. 4.) The quarries were situated about 4 m. from the city of Paros, and remain exactly in the state in which they were left by the ancients. Dr. Clarke says they had been wrought with infinite skill, and that the blocks had been cut out with such precision that there was not the smallest waste v. [20. 6va. ed.]

According to Thucydides (III. 1.), Paros was originally settled by Phoenicians. It early attained to great wealth and consideration, and established colonies in Thasos and other islands. During the first Persian war, it sided with the Persians; and after the defeat of the latter at Marathon, the city of Paros was unsuccessfully besieged by Miltiades. Themistocles, however, rendered it tributary to Athens. It produced several distinguished individuals, among whom may be specified Archibuthus, the inventor of leucica *

In modern times, the only event of importance connected with the history of Paros is the discovery of the "Parian, or Arundelian Chronicle." This is a chronological account, cut in marble, of the principal events in the history of Greece during the period of 1316 years, beginning with Ceryra, and ending with the archbishopric of Dionysius, anno 84 a.c. The chronicle for the last 60 years is, however, obliterated; and the inscription is in many parts a good deal defaced.

The marble slab on which this chronicle is cut was purchased on the spot, in 1834, for the Earl of Arundel, whence it is now frequently called the Arundelian Chronicle; and being brought to England in 1837, the inscription was soon after copied, translated, and published by Aiden and other eminent scholars. Unfortunately the marble afterwards met with the most barbarous treatment, having been broken, and a part of it employed, as is alleged, to repair a chimney in Arundel House. The portion that remained this was then Gothic usage was presented in 1857 to the university of Oxford, of which it is one of the most precious relics. (*Robertson on the Pictish Chronicle*, pp. 43-45.)

For a lengthened period the Parian Chronicle was regarded as of unquestionable authority, and was referred to as such by all inquirers into ancient history. In 1798, however, its authenticity was called in a singularly clear, able, and ingenious dissertation, by the Rev John Robertson, who contended that it was altogether spurious, and had been fabricated in modern times. As was to be expected, this dissertation elicited various answers, by Mr. Hewlett, Porson, the celebrated Greek scholar; Gough, the antiquary &c., and at present it seems to be generally concluded by the ablest critics and scholars, that the objections of Robertson have been unsatisfactorily disposed of, and that there is no good or sufficient reason for doubting that the Parian Chronicle was really compiled about 280 years B. C.

PARSONSTOWN, or **BIRR**, an inland town of Ireland, King's Co., on the confines of Tipperary, on the Birr a branch of the Limer Broome, 14 m. above its confluence with the Shannon, and 69 m. W. S. W. Dublin. Pop., in 1821, 3,408; in 1841, 6,326. It has a large square, in which is a pillar surmounted by a statue of the Duke of Cumberland, erected in commemoration of

* The *Stratimedeus* *Geographicus* says that the famous oracles Pheidon and Phalaris were natives of Paros. In point of fact, however, the former was born at Athens, and the birthplace of the latter is unknown.

the victory of Culloden, in 1746, and some good streets. Its public buildings are the parish church, a fine R. Cath. chapel, the cathedral of the see of Killaloe, 3 meeting-houses for Independents, 1 for Quakers, and 2 for Methodists, a fever hospital, a dispensary, a court-house, and a bridewell. Near it are large barracks. It has various schools, and is the seat of a manor court, general sessions and petty sessions: it is also a constabulary station, and has two distilleries, a brewery, and an extensive retail trade. The river is navigable for 2 m. from the Shannon, for barges. Markets on Saturdays; fairs, Feb. 11., May 5., Aug. 25., and Dec. 10. Post-office revenue in 1830, 9577.; in 1836, 1,2677. Branches of the provincial and agricultural banks were opened in 1833 and 1836.

Close to the town is Birr Castle, the seat of the Earl of Rosse, the head of the noble family of Parsons, whence the town has its name, and to whom it is greatly indebted. The castle, which is of considerable antiquity, has been completely modernised, and greatly improved by its present proprietor.

PASCO, or CERRO DI PASCO, the principal mining town of Peru, dep. Junin, prov. Huanaco, in an irregular hollow on the table land of Bombon, nearly 14,000 ft. above the level of the sea, and 60 m. S. by W. Huanaco. Pop. varying at different seasons from 4,000 to perhaps 12,000. It is a mean, wretched place, which, previously to the establishment of the Peruvian Mining Company, in 1825, had not a house with a chimney, fireplace, or glazed window; and even now its dwellings are principally covered with thatch, a frequent cause of destructive fires. The town — of which the very *adobes*, or unburned bricks, partly used in some of the houses, contain silver — is so burrowed under, that a person is in no small danger of inadvertently falling into old mines, or rather pits, sometimes superficial, sometimes deep and fathomless, and half-filled with water. There are several hundred well-known mines, from which silver has been and still could be extracted in large quantities, provided a perfect drainage were effected. But during the revolution a great many of the mines were allowed to fill up with water, and only about 30 are now wrought for eight months a year. From 1825 to 1836 inclusive, 2,190,555 marcs of silver were reduced to bars in the foundry at Cerro Pasco; the produce in the latter year having been 237,840 marcs. These mines have the advantage of being near a coal mine, which has of late years been opened; but turf, dung, timber, &c., are the kinds of fuel most commonly used. The miners choose whether they will be paid in money or a proportion of the ore. In the former case they get four reals, or 2s. a day; but they prefer of course payment in ore, if the mine be productive; and sometimes realize, in this way, very high wages. But the gambling nature of the pursuit has the worst effect on all parties engaged in it. The miners are almost universally profligate, and involved in debt; and but few of the undertakers have made fortunes. (*Smith's Peru as it is*, ii. 1—20.)

PAS-DE-CALAIS, a dep. of France, reg. N., formerly comprised in the provs. of Artois and Picardy, between the 50th and 51st degs. N. lat., and 1° 35' and 3° 10' E. long.; having N.E. and E. the dép. Du Nord, S. Somme, W. the English Channel, and N. the Strait of Dover, or *Pas-de-Calais*, whence its name. Area, 655,645 hectares. Pop., in 1846, 695,756. There are several chains of hills, but none of any considerable height. The Scarp, Lys, and Aa, rise in this dep.; besides which the principal rivers are the Liane, Canche, and Authie, having mostly a N.W. course. Except about Boulogne, the coasts are generally low, and in some places bordered with sandy downs, which are, however, prevented from increasing to an inconvenient extent by being carefully planted. The soil is, for the most part, good; and agriculture is, on the whole, well conducted. Of the surface, in 1834, 492,374 hectares were supposed to be arable; 46,210 in pasture; 21,852 in orchards, gardens, &c.; 43,107 in woods, and 18,845 in heaths and wastes. Near Boulogne, farms vary in size from 85 to 250 acres; but, in general, they do not exceed 140 acres. Few are cultivated by the proprietors, being usually let to farmers who pay a money rent, and are also charged with the payment of the land-tax. All kinds of corn, but principally wheat and maslin, and large quantities of beans, peas, and oleaginous seeds, are raised. About 1,522,000 hectol. of potatoes were grown in 1835; and a good deal of land is devoted to the growth of beet-root. The annual produce of beer is estimated at 360,000 hectol.; of cider, at 36,000 h.; and of malt spirits, at 11,000 h. In 1830, there were estimated to be nearly 200,000 oxen and cows, and 300,000 sheep in the dep.; the produce of wool averages about 662,000 kilogr. a year. The farmers, though not prosperous, are contented with their condition; and there are few paupers requiring permanent relief. In 1835, of 232,002 estates subject to the *contribution foncière*, 101,918 were assessed at less than 5 fr., and 39,402 at from 5 to 10 fr. Some coal is met with;

but the greater part of that made use of in the dep. is brought from Belgium; and wood and turf are the principal species of fuel. About 8,984,000 kilogr. of beet-root sugar were made in this dep. in 1836, a greater quantity than in any other French dep., that of the North excepted. Arras is famous for lace and gingerbread. A portion of the pop. of Boulogne and Calais is occupied in the manufacture of tulles; in the arrond. of Bethune many hundreds are employed in making linen stuffs and yarn; and manufactures of cotton stuffs and yarn are pretty general. Spirits, leather, gunpowder, soap, glass and earthenwares, tobacco pipes, &c. are also produced. Artesian wells (so named from the prov. Artois) originated in this dep. The Pas-de-Calais is divided into 6 arronds.; chief towns, Arras, the cap.; Bethune, Boulogne, Montrens, St. Omer, and St. Pol. Calais and Boulogne are the principal sea-ports, and have a considerable coasting trade, and share in the cod, herring, and mackerel fisheries. The dep. sends 8 mems. to the Ch. of Dep.; number of electors in 1838-39, 4,512. Total public revenue (1831), 18,813,372 fr. (*Hugo, art. Pas-de-Calais; Dict. Géogr.; French Official Tables; and Parl. Reports on Agriculture*, 1834.)

PASSAU (an. *Castra Batavia*), a fortified frontier city, principally belonging to Bavaria, circ. Lower Bavaria, of which it is the cap., on the Danube, where it is joined by the Inn, and also by the small river Ilz, 68 m. R. S.E. Ratisbon; lat. 48° 34' 28" N., long. 13° 28' 5" E. Pop., in 1845, 10,211. It consists of the city proper, built in the angle between the Danube and Inn, and of three smaller portions beyond the Danube, the Inn, and the Ilz, the latter being within the Austrian dominions. These different parts are connected by bridges, and surrounded with fortifications; and are further defended by two citadels, and some inferior forts; this being, in fact, one of the most important fortresses in the line of the Danube. The defile, in which the town is situated, is highly picturesque; and it has a striking appearance from the river, though not generally well built. The cathedral, however, is a magnificent modern edifice, in the Italian style, and several of the other churches are handsome: the old Jesuit's college, now a lyceum, the bishop's palace, several hospitals, an orphan asylum, and the post office are the other principal public buildings. On a hill, adjacent to the Innstadt, is the shrine of *Maria-Hilf*, a celebrated place of Rom. Cath. pilgrimage. Passau is the seat of circle, police, and taxation boards, and has an episcopal seminary, a school of industry, manufactures of leather, tobacco, and pottery-ware, docks for ship building, and an active trade both up and down the Danube. It was long the cap. of an ecclesiastical principality, secularised in 1805. Here, in 1552, a treaty was concluded between Maurice, elector of Saxony, on the one hand, and Ferdinand, king of the Romans, on the part of the Emperor Charles V., on the other, by which the latter agreed to set the landgrave of Hesse at liberty, and to allow the Protestants full freedom of conscience. (*Berghaus; Sketches of Germany*, ii. 101, 102. &c.)

PATAGONIA, an extensive country of S. America, comprising nearly the whole of that continent S. of lat. 38° S., and having N. the territories of La Plata and Chill, S. the Strait of Magellan, separating it from Terra del Fuego, E. the Atlantic, and W. the Pacific. Little is known respecting this region beyond its coast outline. The Andes in Patagonia appear to consist of but one cordillera, the mean height of which may be estimated at 3,000 ft.; but opposite Chiloe there are some mountains probably from 5,000 to 6,000 ft. in height. (*Geog. Journ.* i. 157.) The W. coast is abrupt, very much broken, and skirted with a great number of irregularly shaped rocky islands. The E. coast has been most explored. The surface of the country appears to rise from the Atlantic to the Andes, in a succession of terraces, all of which are alike arid and sterile, the upper soil consisting chiefly of marine gravelly deposits, covered with coarse wiry grass. No wood is seen larger than a small thorny shrub, fit only for the purpose of fuel, except on the banks of a few of the rivers subject to inundation, where herbage and some trees are occasionally found. This sterility prevails throughout the whole plain country of Patagonia, the complete similarity of which, in almost every part, is one of its most striking characteristics. It is stated, however, by the Indians on the Rio Negro, which forms the N. boundary of Patagonia, that near the Andes, wheat, maize, beans, lentils, pease, &c., are raised. This latter region is not, however, placed under the same circumstances as the country more to the eastward, nor is it subject to the causes which mainly occasion its sterility.

A great deal of rain falls in the Andes, and the country immediately E. of the mountains is thickly wooded, and is injured by too much rain. This results from the moisture which the W. winds, that prevail throughout most part of the year, bring with them from the Pacific, being condensed and precipitated in the mountains and immediately adjacent territory; so that after passing these

regions the winds are quite dry; and S. winds, which are very rare in Patagonia, are those only which convey any moisture to the desert E. of the Andes. Porphyry basalt, sometimes containing numerous organic remains, and a little rhyolite, greatly commencing, but not identical with, chalk, are among the mineral formations hitherto mentioned as the most prevalent in S. Patagonia. The geology of the country is so limited in its scope. Common are met with sometimes in beds of several hundred feet, and there occurs the puma, and a small kind of fox, are almost the only other wild quadrupeds at all abundant, except mice. The latter are of many species, and so numerous that, according to Mr. Darwin Patagonia, near as due to in some respects, and perhaps, best of a greater stock of small rodents than any other country in the world. (*Journal of Adventure and Discovery*, III. 243.) The number and the diversity are limited among the few species of birds. The reptiles and insects afford present nothing remarkable.

The Patagonian Indians are tall and bulky, and, though not absolutely gigantic, they may be said, after rejecting the exaggerations of the early and the contradictory statements of later travellers, to be the tallest people of whom we have any accounts, the average height of the men being probably not under 6 ft. Their heads and features are large, but their hands and feet small, and their limbs are neither so muscular nor so large-boned as their height and apparent stoutness would induce one to suppose. Colour a dark copper brown, hair black, thick, and coarse, and that above the temples by a fillet of plaited or twisted sinews. A large mantle of guanaco skins loosely gathered about their neck and hanging from the shoulders to the ankles is, with a kind of drawers and knee bands, almost their only article of dress and adds much to the bulkiness of their appearance. They neither shave the nose nor lips, but disfigure themselves greatly with paint. They lead a nomadic life, living in tents formed of poles and skins, and subsisting on the flesh of the wild animals they catch. Both men and women ride on horseback, and are often furnished with saddles, bridles, stirrups, spurs, and Spanish gaiters of various kinds, which they obtain from Valdivia and other places in S. Chili. Their arms consist generally of a long tapering lance, a knife or cut-throat, if one can be procured, and the bolas, a missile weapon of a singular kind, carried in the girdle, and consisting of two round stones, covered with leather each weighing about a pound. These, which are fastened to the two ends of a string, about 8 ft. in length, used as a sling, one stone being kept in the hand, and the other whirled round the head, are supposed to have acquired sufficient force when they are together discharged at the object. The Patagonians are so expert at the management of this double-headed shot, that they will hit a mark not bigger than a shilling with both the stones at a distance of 15 yards. It is not customary with them, however, to strike either the guanaco or the ostrich with these, but to discharge them so that the cord comes against the legs of the ostrich or the fore legs of the guanaco, and is twisted round them by the force and spring of the balls; so that the animal being unable to run, becomes an easy prey to the hunters. These people live under various petty chiefs, who, however, seem to possess but little authority.

Patagonia was discovered by Magellan in 1493. The goodness of its harbours, which are usually difficult and dangerous of access, and afford little or no anchorage, shows the size of a brig, has been the object of any European settlement, St. John, about lat. 48° 10' S., and where the Spaniards settled about 1800, abandoned the establishment. A few years undertaken to the interior in the latter by the officers of the *Adventure* the larger rivers, but the results are by any other than whaling vessels, and the country is not such as to hold out any hope of its ever emerging from its present state of savage barbarism. (*Parish's Buenos Ayres*, &c. II. 26, *Journal of the Adventure and Discovery*, Long Jour. I. vi.)

PATROS (bad Patras), a small island of the Greek Archipelago, belonging to the Sporades, celebrated in antiquarian history as the place of St. John's exile, during Domitian's persecution, 11 m. N. W. Lero, and 30 m. E. the W. extremity of Samos, its chief town being in lat. 37° 17' N., long. 26° 24' E. Pop. according to Burgma, about 4,000. It is of very irregular shape, about 10 m. in length, 5 m. in breadth, and 30 m. in circ. Tournefort, whose authority is entitled to the highest respect, describes Patros as the most barren rock (mountain devoid) of the Archipelago (I. 620) others, however, contest its fertility, and Dr. Clarke says, that from all he could collect on the subject, it is about as fertile as any of the neighbouring islands, were it not for the danger to which property is exposed from the continual invasions of pirates. (vi. 68. Sec. ed.) It has numerous harbours, of which that of La Sufa, on the E. side, deeply indenting the island, is the principal.

Above the landing place is a small village, comprising about 20 houses and shops. On the ridge of a mountain, overlooking the port is the cap of the island, comprising about 600 substantial stone houses. Its streets, however, are steep, ill paved, and extremely narrow (not being more than 6 ft. wide). The monastery of St. John's, on a mountain close to the town of Patras, built in the commencement of the 13th century, is, in fact, a pretty strong fortress, and commands a noble and extensive view of the sea and surrounding islands. It is supplied by about 50 monks, and has an attached church, and a library containing some early printed books and numerous MSS., some of which were purchased by Dr. Clarke. The famous griffin, or caver, covered by a chapel, where St. John is said to have written the apocryphal to the disciples of the Holy Spirit, is situated on the base of the hill, about half way between the town and the port. Clarke says that it is not spacious enough to have afforded a habitation even for a hermit, but the monks, to quash all doubts as to its being really the retreat of St. John, show the crevices in the rock through which, as they allege, the divine commands were communicated to the apostle. In point of fact, however, there is not a sentence in the apocryphal to warrant the inference that it was written in a cave; and if there had, any other cave in the island would have answered the purpose quite as well as this.

The island produces only a few grapes, and is furnished with corn and other articles of subsistence from the Black Sea, Russia, and Smyrna. The male inhabitants are chiefly seamen, and from their petty extensive intercourse with different European nations have become more enlightened than the generality of Greeks. The women (who, according to Tournefort, are generally pretty, though much disfigured by their strange customs) are chiefly employed in knitting cotton stockings. Tournefort mentions that for every man on the island there are at least twenty women; but this disproportion was, no doubt, occasioned by the men being mostly at sea, and is not mentioned by later writers. (*Tournefort's Voyage de France* I. 420. *Clarke, vi. 11. Sec. 1. Burgma's Greece and Lemnos* II. 34. 35.)

PATRA a city of British India, presid. Bengal, prov. Bahar, of which it is the cap., on the S. bank of the Ganges, 144 m. S. M. E. Patna, and about 200 m. W. Calcutta, lat. 25° 57' N., long. 85° 19' E. Pop. estimated at upwards of 100,000 (*Hemphill*). Within the walls it is not much more than 1½ m. in length, by 3-4ths m. in average breadth; but, including its straggling suburbs, it extends for 8 m. along the banks of the river and 3 m. inland. The town itself is very closely built, and surrounded with fortifications in the Hindoo style, which are now, however, completely decayed. At a short distance, it has a very striking appearance; being full of large buildings, with remains of old walls and towers, and bastions projecting into the river, and backed by irregularly elevated land. It has, however, but one wide street, all the other thoroughfares being narrow, crooked, and mean. The houses are partly built of brick, and many have terraced roofs and balconies; but the greater number are of mud, with tiled roofs. E. of the city is a large suburb, with many well-built churches, and in the same direction are the gardens belonging to the palace of Jaffer Khan, two or three miles in extent. The suburb of Runkipour,

small in the Bengal presidency, the residence of a siltah judge, a collector, a commercial resident, and an opium agent, it has but few English inhabitants. This city is not celebrated for any particular manufactures, but most articles of foreign and domestic produce may be procured in its houses. The neighbouring country produces the finest opium and saltpetre and great quantities of wheat and other grains, sugar, indigo, &c. The opium and saltpetre are monopolized by government and produce a large revenue, but a considerable trade is carried on in the other articles. It was at this city that the English first established a factory in the eastern provinces of Hindostan; and it is indebted to the European trade for most part of its growth and prosperity. (*Hemphill's E. I. Jour.*, *Hemphill* &c. on Mad. Tree is.)

PATRAS (or Patra) a town and seaport of independent Greece, on the N. W. coast of the Morea, and on the E. side of the gulf of its own name, about 5 m. S. W. the mouth of the Gulf of Lepanto, lat. 37° m. W. by N. Athens, lat. 38° 14' N. long. 21° 47' 48" E. Pop. 200

to Burgess, about 4,000, exhibiting a decrease of nearly two-thirds since the commencement of the revolution. It is built amphitheatre-wise on the side of a hill rising from the shore, which has at its summit the acropolis, commanding a fine view of the surrounding coast and country. The fortifications are in good repair, and have been recently much enlarged. The interior comprises one pretty broad and well-built street, with numerous narrow lanes and alleys lined with mean wooden tenements, the overhanging eaves of which nearly meet over the street. The Greeks have a few good houses; but those of the European consuls are the best. Every considerable house is surrounded with a garden well stocked with orange, fig, pomegranate, and other fruit trees, which give the town an agreeable aspect, and conceal the greater part of the poorer habitations. The only public buildings are two hospitals and several churches; the remains of ancient buildings are but inconsiderable.

The bay in front of the town being unsafe, and exposed to heavy seas, particularly in winter, vessels go a little farther up the Gulph, where the port is situated, and where there is a mole for their security. Patras has a pretty extensive trade. The principal exports are currants (by far the most important article), oil, valonia, wine, raw silk and cotton, wool, skins, wax, &c. The imports here, as at the other Greek ports, consist principally of colonial produce, manufactured goods, salt fish, cordage, hemp, deals, &c., chiefly from the Ionian Islands and Great Britain, Venice, Trieste, Leghorn, and Marseilles. The imports from Great Britain amounted, in 1838, to 13,490*l.*, the shipments to Great Britain in the same year being valued at 171,340*l.*; but this discrepancy is apparent only, the excess of exports being balanced by the imports of British produce from the Ionian Islands and other places. According to the tariff now in force, the rate of duty (without distinction of foreign or native flags) is 10 per cent. *ad valorem* on imports, and 6 per cent. *ad valorem* on exports.

The ancient Patra is supposed to have been founded by the Ionians. Herodotus enumerates it among the 12 towns of Achæa (i. 146.). Its inhab. took an active part, and the town suffered greatly in the Achæan war. After the battle of Actium, however, it was raised to its former flourishing condition by Augustus, who made it a colony by establishing in it some of his veterans. In Strabo's time it was a large and populous town; and in the beginning of the 3d century it was still prosperous, though remarkable for the dissoluteness of its inhab. (*Pausanias, Achæic.*, c. 21.) It was the seat of a dukedom under the Greek emperors, and in 1408 was bought by the Venetians, from whom it was taken by the Turks, in 1446. It was pillaged by the Albanians in 1770, and was the stronghold of the Ottomans from 1821 down to the period of the emancipation of Greece. (*Burgess's Greece and Levant*, i. 124—128.; *Mod. Trav.*; *Cramer's Greece*, iii. 66—69.)

PAU, a town of France, dép. Basses-Pyrénées, of which it is the cap., on the Pau, here crossed by a fine stone bridge of seven arches, in a fertile though marshy plain, 58 m. E. by S. Bayonne. Lat. 43° 17' 29" N.; long. 0° 22' 30" W. Pop., in 1846. (in. com.) 13,920. It is regularly laid out and well built, consisting principally of one long and broad main street. It has, however, several squares, or open spaces, and is environed by public walks. Its principal, and by far the most interesting edifice is the castle, in which Henry IV. first saw the light on the 13th Dec. 1553; it was founded by the princes of Béarn in the 10th century, is situated on a commanding height to the W. of the town, and forms an irregular collection of massive towers, having a fine terrace on the side fronting the river. It was much injured during the Revolution, having been converted into military quarters; but it has since been completely repaired and renovated.

The chamber, memorable as the birthplace of Henry IV., retains its ancient portraits and furniture, the tortoise-shell cradle of the king, &c. There is a marble statue of Henry in the vestibule of the castle, and another statue in bronze in the *Place Royale*. The other principal buildings comprise the prefecture, hall of justice, college, and one or two hotels.

Pau has a royal court of tribunals of primary jurisdiction and commerce, boards of taxation and forest economy, a royal college, an *académie universitaire*, a society of agriculture, a school of design and gallery of paintings, a public library of 18,000 vols., &c. Its manufactures include cotton stuffs, linen cloths or *toiles de Béarn*, &c., and it has considerable dyeing establishments and tanneries: it has, also, a pretty extensive trade in manufactured products, and in wines, Bayonne hams, salted geese, &c. It has two large weekly markets, and three important annual fairs. Inglis says, "Pau has always enjoyed the reputation of being one of the most interesting cities of the S. of France. It is clean, airy, and abounds in every convenience and in most luxuries. It is a great resort for strangers, particularly English; and, excepting Bayonne, is probably

the most desirable of any of the towns selected by foreigners as a residence. Excellent houses are to be obtained at a very moderate expense, and the markets are both abundant and cheap. There are generally 50 or 60 English families in Pau and its neighbourhood; and the number, I understand, is upon the increase." (*Switzerland, the Pyrenees, &c.*, 309, 310.)

Besides the "great" Henry, Pau has produced several distinguished persons, among whom may be specified Marshal Bernadotte, now king of Sweden; and Viscount Orthes, governor of Bayonne, who nobly refused to execute the orders issued by Charles IX. for the massacre of St. Bartholomew. (*Hugo, art. Basses-Pyrénées; Guide du Voyageur, &c.*)

PAVIA (an. *Ticinum*), a frontier city of Austrian Italy, Lombardy, cap. deleg. of its own name, on the Ticino, 19 m. S.S.W. Milan; lat. 45° 10' 47" N., long. 9° 9' 48" E. Pop., in 1837 (ex. com.), 23,531. It is surrounded with old walls, and communicates with a suburb across the Ticino by a bridge of 7 arches, constructed in 1851. This structure, partly of stone, but principally of brick, is one of the most singular monuments of the 14th century: it is 300 ft. in length by 12 in breadth, and is covered with a curious roof, supported on 100 pillars of rough granite. At one end is the Austrian and at the other the Sardinian custom-house, the Ticino separating their respective territories. This is a magnificent venerable city; but its buildings and its fame belong to another age, and it has long been in a state of paralysis and decay. From the bridge, the *Strada Nuova* or *Corso* extends through the centre of the city to a superb gate, begun under the viceroyalty of Prince Eugene. In this street the principal palaces of the Pavian nobility, mouldering and dismantled, are mingled with shops, churches, colleges, cafés, theatres, and hospitals. From the main street others of greater antiquity branch off at right angles, some terminating in *piazas* opening before vast and cumbersome palaces, now half ruinous and dismantled. From its numerous public edifices, Pavia was formerly called the "City of a hundred Towers;" but these are now greatly diminished. It has, however, a ruined castle, once the residence of the Lombard kings, and several other buildings traced up to the time of the Lombards, particularly the church of St. Michael, in a barbarous and grotesque style. The church of *San Pietro in Cile d'Oro*, which is said, though on doubtful authority, to contain the remains of St. Augustine, and which certainly contains those of Boëthius, is in the same early and rude style; but, *tempora mutantur*, the venerable edifice is now converted into a granary or barn! The cathedral has little that is remarkable; it was begun in 1485, and is of large dimensions; but it yields in interest to the churches of the Carmine, San Francesco, S. Salvador, &c. The palace of Theodorico was destroyed in a popular tumult in the 11th century; and the tower in which Boëthius was confined and wrote his famous treatise, *De Consolatione Philosophiæ*, no longer exists. On the site of the latter, however, is the Malespina Palace, at the entrance of which is a marble monument and bust of the philosopher. Previously to the reign of the emperor Joseph II., Pavia had 46 wealthy convents; but few, if any, exist at the present day. The theatre and the university buildings are almost the only other structures worth notice: the interior of the former is rendered dark and gloomy by the black marble of which it is constructed, and the latter, according to Mr. Woods, are magnificent rather by their extent than by any merit in their architecture.

The university of Pavia, the first and most frequented in Italy, was founded by Charlemagne, and restored by Galeazzo Visconti in the 14th century; but it owes its present form and institutions to the Empress Maria Theresa, and her minister Count Firmian. It has faculties of law, medicine, and philosophy; being particularly celebrated as a school of medicine. It has no faculty of theology, but in every other respect its constitution is similar to that of Padua (which see). It has at present 38 professors, 3 adjuncts, and 11 assessors; and in 1837 had 1,307 students, of which 287 belonged to the philosophical, 438 to the legal, and 582 to the medical faculty. Its revenues are derived principally from imperial treasury grants, legacies, municipal and communal funds, and fees paid by students on obtaining degrees; which last average about 150,000 *lire* a year. The whole expenditure for the university amounted, in 1837, to 250,000 *lire*. The professors have annual salaries of from 3,000 to 6,000 *lire* (12*l.* to 240*l.* sterling); and enjoy, by special privilege, the distinction of personal nobility. Several of the most distinguished names in the history of Italian literature and science, have been professors in this university. Among others may be specified Vesalius, Cardan (a native of the city), Spallanzani, Volta, Scarpa, Tamburini, &c.; and it has still to boast of many eminent teachers. The university has an extensive library, which it chiefly owes to Count Firmian; a fine botanic garden, instituted by the French; a valuable collection of natural history, physical and anatomical

students, &c. Students are lodged and boarded gratuitously, in 3 colleges attached to the university. The College Caracci, founded by a noble family of Florence, receives 80 boarders from that city and district; the College Serravalle, a study and recitation edifice, founded by the Roman Cardinal Serravalle, supports 80 students; and the College Ghislieri, founded by Pope Pius V., receives 80 students; but the greater number of the students are extra collegians. Pavia has also a gymnasium, a high school and female school 2 hospitals numerous asylums, and charitable institutions, a *monasterio di pavia*. It is a bishop's see, the seat of the superior court of the ducal, and a chamber of commerce. It has paper mills manufactories, and a considerable trade in agricultural produce with Milan and the cities on the Po. It is connected with Milan by a navigable canal traversed by locks like the Dutch brotherlocks. A good deal of the cheese, called Parmesan, is made in this neighbourhood. About 4 m. N Pavia, is the celebrated Carona, the most magnificent of Italian manufactories, founded by John Galeazzo Visconti in 1388, and dissolved, and in part restored by the French, in 1795.

Torino, which was an important city under Augustus, began to be called *Papa* (whence its present name), during the Gothic dominion in Italy. In modern times it has sustained numerous sieges, but it is principally distinguished, in an historical point of view, by the great battle that took place in its vicinity on the 24th of Feb. 1801 between the French army that had undertaken the siege of Paris, under Francis I. and the Imperialists, under the vicerey Lannes. The French were totally defeated. Francis, who had displayed the greatest heroism, and the king of Sardinia, were taken prisoners, and estimates of many generals and persons of distinction, between 2,000 and 10,000 private soldiers were left on the field of battle. The French army was in fact, entirely destroyed, and there was quite as much of truth as of poetry in the famous epistle addressed by Francis to his mother after the battle — "Madam, we have lost all we kept any longer." (*André Mal Heron; Von Heron's Italy; Journal of Education; Wood's Letters; Chandler's Italy; Robertson's Charles V. book iv. &c.*)

PAKO (or *Paou*) the smallest of the seven principal Looian islands, in the Indian Sea, 10 m. S. by E. Corfu, and about the same distance W. the main land of Greece, its N. point being in lat. $39^{\circ} 14'$ N. long. $27^{\circ} 7'$ E. Area, 9 sq. m. Pop. in 1894, 2,397. It is oval-shaped, and extremely mountainous; its soil being stony, and on districts of molasses, that in summer the islands are obliged to procure fresh water from the neighbouring continent. The climate is extremely mild and agreeable, but the island produces little else than olives, figs, and wheat, the quantity of corn raised being altogether insignificant. Hides and goats are reared to considerable extent, and fish are abundant on the coast. Port Lido, the principal port on its E. side, affords good anchorage for a few vessels, but a more secure harbour is formed by the channel between this and the neighbouring island of Antipara. The town has a pop. of 4,000 persons, but is apparently no little better than a stone village.

PAS (LA), a city of Bolivia, cap. dep. of its own depto, 128 m. N. N. W. Cochabamba, lat. 17° 30' N., long. 65° 30' W. Pop. 12,000. It is situated on the E. extremity of the Andes, at an elevation of 12,170 ft. above the sea, and at no great distance from the sources of the Beni, a principal affluent of the Amazon. It has a cathedral, four other churches, several conventual establishments, and is a bishop's see, with very considerable revenues. It is the centre of a considerable trade in Peruvian tea.

La Paz was founded in 1660, and received its name in commemoration of the peace that ensued after the death of Gonzalo Pizarro and his associates. It suffered considerably a few years ago during a revolt of the Indians, but still ranks as a city of some wealth and importance. (See *Chas.* for)

PEBBLES an inland co. of Scotland, having N. High-Lathes, E. Souths, S. Dumfries, and W. Lanark Areas, 204,169 acres, of which a comparatively small portion only is arable. This is almost wholly a pastoral district, the surface consisting of moorland, moss, and bog, with the exception of a limited extent of low level land along the banks of the Tweed, which rises in and runs through the co. The highest mountains are in the E. part of the co. adjoining Dumfriesshire, where the Tweed has its source. The summit of Brackenrass rises 2,741 ft. above the level of the sea, and this, which is about 100 ft. above the altitude of the neighbouring summit of Hartfell, is the highest elevation in Scotland S. of the Firth of Forth. The hills are generally smooth, and afford good sound sheep pasture. In the low parts of the co. agriculture has been very much improved, but it is now pretty generally believed that tillage had been too much extended during the late war. The buildings on farms of any importance have been entirely renovated, principally within the last 20 years. The black-furred breed of sheep

town, all are very distinct speech, diffused over the whole co., to the exclusion of every other; but about 1750 Cheviots began to be introduced; and their numbers have since so rapidly increased, that, even in the parish of Troughmore which is the richest and most exposed, there are now 8 Cheviots to 1 black-faced sheep. The total sheep-stock at present in the co. may be estimated at above 100,000. Property is in a few hands, farms being very large, average rent of land in 1843, 6s. 7d. an acre. Neither minerals nor manufactures of any importance. Fisheries is divided into 14 parishes, and returns 1 mion. in the H. of C. Registered steamers, in 1845-20, 000. Fisheries is the only town of any importance. In 1861, this co. had 2,110 inhab. human, and 10,000 inhab., of whom 6,110 were males, and 6,004 females. Valued rent, 61,000£ Scotch. Annual value of real property in 1815, 64,100£

Panama, a royal bar, and market town of Honduras, on the Pacific, of which it is the cap. and the only town, romantically situated in a mountainous pastoral district, on the Tera, which is here crossed by a bridge of the Ed-

as particularly interesting, and is much respected in summer as a favorite country residence.

Puritan was long a hunting customer of the Scottish kelp, particularly of Abbe 111., who founded in 1180 a monastery for Red Friars, in 1580, of which the ruins are still pretty entire. The Poem "Psalms to the Play" was written by James I. of Scotland. Newburgh Castle, inhabited by the Earls of March till 1776, stands on a rocky promontory overlooking the Tweed. J. M. W. of the town. George Park the travestie published as a caricature in Puritan for some time previously to his second mission (1818) to Africa. Before the passing of the Reform Act, Puritan was united with Falkirk, Linlithgow, and Leith in creating a union to the H. of C., but it was then merged in the co. constituency. (Puritan's Description of Tweeddale, 1618, New St. Ann. of Scotland, Dundee Edition.)

PEGL, a former kingdom of India beyond-the-Brahmaputra, forming at present the N portion of the Mizo state. (See Hima.)

First, a decayed city of the Burmese empire, and the an cap of the above kingdom, on the Paga river a tributary of the Irrawadi, 33 m. Bangon. Lat 17° 00' N. long 95° 15' E. While it remained the cap of an indep. state, it is said to have had a pop. of 100,000, but being taken in 1766 by the Burmese monarch Alompra, he razed most of its buildings to the ground, and reduced its inhab. to a state of slavery. At pres. it consists of only two streets, one parallel to the river and the other leading to the westward thence-north, or great pagoda. Then, the most famous edifice in the Burmese empire, boasts of high antiquity, and is raised on successive terraces in a manner similar to the religious structures of the Mexicans, as described by Humboldt. It stands on an apparently artificial hill, the sides of which are steeped into two terraces, and surrounded by stone of heavy stones.

The lower and greater terrace forms an exact parallelogram, and is about 10 ft. in height, the upper and smaller terrace is of similar shape, and rises about 3 ft. above the lower terrace, or 33 ft. above the level of the ground. According to Col. Symes a side of the lower terrace is 1,200 ft. in length and of the upper 600 ft. The earth forming the terraces appears to have been taken from the ditch which formerly surrounded the city and which may still be traced, enclosing a quadrangular space nearly 1 km. on each side. The brick walls containing the sides of the terraces were formerly covered with plaster, wrought into various figures, but they are now in a ruinous state. The area of the lower terrace is strewn with fragments of decayed buildings, but the upper is kept free from filth, and is in tolerable order. On the second terrace is the pyramid, a pyramidal building of brick and mortar, without excavations or openings of any sort, octagonal at the base, each side measuring 100 ft. and diminishing in breadth abruptly till it becomes of a spiral form. Its entire height from the ground is about 300 ft., it is surrounded by two rows of small spires, a great variety of mouldings, ornaments in stone, &c., the whole being crowned with the arc, a sort of umbrella of open iron work, 5 ft. 6 in. in circumference, surrounded by a number of small balls, and from the centre of which, when Symes saw it, rose a rod with a silver ornament. At the time of his visit, also

there were temples in miniature of the larger, at all the angles of the upper terrace, various saloons embellished with carving and gilding, numerous sculptures in masonry, idols, flying pennants, three large bells used by devotees on the N. side of the temple, many dwellings for priests on the lower terrace, &c.: probably most of these still exist, for a recent traveller states that the pagoda, with its appendages, is in tolerable preservation. (*Malcolm*, i. 89.) Pegu has several other temples, but they are mostly in ruins; and the site of the ancient city is almost wholly under water, probably from neglect of the drains and sluices. Mindjeree Praw, king of Birmah, in 1790, endeavoured to restore to Pegu a portion of its former importance, by transferring thither the provincial government from Rangoon, but he did not succeed. Zangnomang, however, on the opposite side of the river, is a prosperous town, and adjacent to it, for many miles, is a succession of thriving villages. (*Malcolm's Travels in S.E. Asia*, i. 88, 89.; *Symes in Mod. Trav. ; Asiatic Researches*, &c.)

PEKING or PEKIN, (Chin. *Pih-king*, meaning "the northern capital,") the modern metropolis of the Chinese empire, prov. Pechelee, in a vast sandy plain, between the Pei-Ho (which has its embouchure in the Gulph of Pechelee), and its important affluent the Hoen-Ho, within about 5 or 6 m. of each, and being united to the Pei-Ho by a canal, 562 m. N. by W. Nankin, and 100 m. W.N.W. the Gulph of Pechelee, in the Yellow Sea; lat. (observatory) 39° 54' 13" N., long. 116° 27' 45" E. We know nothing certain of the population, except that it is very great: some writers estimate it at two millions, and others at three millions; we believe, however, that even the smallest of these estimates is beyond the mark, and that probably it does much exceed, if it be not under, 1,500,000. Klapproth estimates it at 1,300,000. A large portion of the space within the walls is occupied by gardens and enclosures; and there is no heaping up of one family above another as in European towns.

The city is divided into two principal portions, exclusive of the suburbs. The most northerly portion, which is nearly a perfect square, is called *nei-tching*, or the inner city; it contains the palace of the emperor, and the principal government officers, and is mostly occupied by Manchoes, whence it is sometimes called the "Imperial," and sometimes the "Tartar city." The other, or more southerly portion, denominated the *wai-tching*, or outer city, is a quadrilateral rectangle, entirely occupied by Chinese, and is at once the seat of business and the residence of the great bulk of the population. Both divisions are surrounded by walls, the extent of which may be about 18 m. The walls of the Chinese city are 30 ft. in height, and 25 ft. broad at the base, and 12 ft. on the top, the slope being mostly on the inner side; but those of the Imperial city are 40 ft. in height. Square towers project from the outer side at intervals of about 70 yards from each other, and each of the 16 city gates is surmounted by a tower nine stories in height, with port-holes for cannon.

The principal streets are of great width, and perfectly straight, (*tirées au cordeau*, Duhalde), running between opposite gates in the divisions of the city to which they respectively belong; those in the northern being, for the most part, better built, and preferable to those in the southern division. The other streets, however, are very narrow, and are, in fact, mere lanes branching off at right angles from the principal thoroughfares. It is singular, that though the great roads leading to the capital be paved with large blocks of granite, the streets are not paved, which makes them dusty and disagreeable in hot, and dirty, and, in parts, all but impassable in wet weather. "*En général*," says M. Hyacinthe, "*l'inégalité, le mauvais entretien des rues, ou plutôt des sentiers, qu'on est obligé de suivre dans les rues, est un juste sujet de blâme contre la police Chinoise*." (P. 12.) The houses, which rarely exceed a story in height, are built of brick, and covered with tiles; but, according to Sir John Barrow, "they are void of taste, grandeur, beauty, solidity, and convenience:" none but the great shops have either windows or openings in the front wall; but most of them have a sort of terrace, with a raised balcony or parapet-wall, on which are placed pots of flowers, shrubs, or stunted trees. The houses in the smaller streets or lanes, many of which are occupied by public functionaries, are very similar to those in the larger streets; and the regularity with which the streets intersect each other, the uniformity in the size and appearance of the houses, and the absence of towers, spires, domes, and even of chimneys (of which not one is to be seen), give the city an extremely monotonous appearance, resembling, in fact, a vast encampment. (*Barrow*, 93.)

"The shops, in the principal streets, make an ostentatious display of painting and gilding. Sky-blue and green, mixed with gold, are the prevailing colours upon the walls. The goods are not only displayed within, but exposed in heaps in front of the houses. Before these are generally erected wooden pillars, whose tops are

much higher than the roofs of the houses, bearing inscriptions in gilt characters describing the goods to be sold, and assuring the buyer he will not be cheated! To attract more notice they are generally hung with various coloured flags, streamers, and ribands, exhibiting the appearance of a line of shipping, dressed in their different colours. Lanterns of horn, muslin, silk, or paper, are arranged before the doors, and exhibit such variety of form, that the Chinese appear to have exhausted on them all the powers of imagination. The streets are peculiarly crowded, in consequence of the number of trades that are carried on in the open air. The numerous movable workshops of tinkers and barbers, cobblers and blacksmiths; the tents and booths where tea, fruit, rice, and other eatables, are exposed to sale; the wares and merchandise arrayed before the doors; the troops of dromedaries laden with coals from Tartary; the wheel-barrow and hand-carts stuffed with vegetables, leave in the broadest streets only a very narrow space unoccupied." Room, indeed, is scarcely allowed for the frequent processions of men in office, with their numerous retinues and strange insignia, or for the pompous trains which attend at funerals and marriages. With the confused voices of the multitude buying and selling their various commodities, are mixed the cries of jugglers, conjurors, fortune-tellers, mountebanks, quack-doctors, comedians, and musicians. It is, however, a curious fact, that the crowd and bustle are wholly confined to the great thoroughfares: the cross streets and lanes being perfectly still and quiet. "Women are frequently seen among the crowd, either walking, or riding on horses, which they bestride like men; but they are all Tartar females, whose manners alone admit of such exposure: the Chinese ladies being more rigidly confined to the house in the capital than in the rest of the empire." (*Barrow's Travels*, p. 94-98.)

At the four points, where the great streets intersect each other, are singular looking erections, somewhat resembling triumphal arches, but, in fact, monuments to the memory of those who had deserved well of their country, or who had attained an unusual longevity! They are built sometimes of stone, but more generally of wood, and consist invariably of a large central gateway, with a smaller one on each side, covered with a narrow roof, and painted, gilt, and varnished.

The northern city, which comprises the residence of the emperor and the principal government officers, consists of three inclosures—an outer, a middle, and an inner. The latter contains the Imperial palace and the houses of the different members of the imperial household, the second is chiefly inhabited by Chinese merchants, and the third, or outermost enclosure, constitutes the open city. The inner portion, or that comprising the Imperial palace and its dependencies, including gardens and pleasure grounds, occupies an oblong space about 2½ m. in circuit. This sacred inclosure, or "forbidden city," is surrounded by a high wall, similar to that surrounding the city, being, like it, flanked with towers, and faced with yellow tiles. Each side of the wall has a large gate surmounted by a tower; the walks, leading to the principal halls, being paved with large slabs of white and grey stone. The "Meridian gate," through which alone the emperor can pass, is by far the most splendid of all the approaches to the palace: here he distributes presents to foreign ambassadors, views the captives that may have been taken by his "invincibles," and shows himself whenever he dispenses mercy. In the *Tae-ko-mun*, or "gate of extensive peace," which is a superb building of white marble, 110 ft. in height, the emperor receives congratulatory visits of ceremony from the various officers of his court: but by far the most sacred, as well as richest and most magnificent portion of the palace is the *Kaen-ising-king*, or "tranquil palace of heaven," the emperor's private retreat, which none may approach without special permission. It is used also as a cabinet, where the great officers of state assemble for consultation, and where candidates for office receive their appointments. The palace of the empress is also very extensive; and beyond it is a gate leading to the Imperial flower-garden, laid out in walks, filled with pavilions, temples, and groves, and interspersed with canals, fountains, lakes, and beds of flowers. Near the empress's palace is a library, alleged, by the Chinese, to comprise a collection of most books published in the empire. Within the precincts also is a temple, to which the emperor comes on certain stated occasions to obtain blessings from the manes of his ancestors, and to show his filial piety. Six palaces are occupied by the princesses of the Imperial family; and other ranges of building constitute the residences of the emperor's stewards, &c.; besides which there are halls for councils, courts, &c., and a large printing establishment. (*Gutslaff's China Opened*, i. 62, 63.)

The reader, however, would form a very inaccurate notion of these buildings, if he supposed they bore any considerable resemblance to European palaces, or that the magnificence of the buildings at all corresponded with

their imposing names. The truth is, that there is but little of pomp or splendour in the imperial residence. "The buildings that compose the palace, and the furniture within them, if we except the paint, the gilding, and the varnish, that appear on the houses even of plebeians, are equally void of unnecessary and expensive ornaments. Those who should rely on the florid relations, in which the missionaries and some travellers have indulged, in their descriptions of the palaces of Peking, and those of Yuen-min-yuen, would experience, on visiting them, a woful disappointment. These buildings, like the common habitations of the country, are all modelled after the form of a tent, and are magnificent only by a comparison with the others, and by their number, which is sufficient, indeed, to form a town of themselves. Their walls are higher than those of ordinary houses, their wooden columns of greater diameter, their roofs are immense, and a greater variety of painting and gilding may be bestowed on the different parts: but none of them exceeds one story in height, and they are jumbled and surrounded with mean and insignificant hovels. Some writer has observed, that the king of England is worse lodged at St. James's Palace than any other sovereign in Europe. Were I to compare some of the imperial palaces in China to any royal residence in Europe, it would certainly be St. James's; but the apartments, the furniture, and conveniences of the latter, bad as they are, infinitely transcend any of those in China. The stone or clay floors are, indeed, sometimes covered with a carpet of English broad-cloth, and the walls papered; but they have no glass in the windows, no stoves, fire-places, or fire-grates in the rooms; no sofas, bureaux, chandeliers, nor looking-glasses; no book-cases, prints, nor paintings. They have neither curtains nor sheets to their beds; a bench of wood, or a platform of brickwork is raised in an alcove, on which are mats or stuffed mattresses, hard pillows or cushions, according to the season of the year; instead of doors they have usually screens, made of the fibres of the bamboo. In short, the wretched lodgings of the state-officers at the court of Versailles, in the time of the French monarchy, were princely palaces in comparison of those allotted to the first ministers of the Emperor of China, at the capital as well as at Yuen-min-yuen." (*Barrow*, 194.)

The second enclosure, in the northern city, is called *Hwang-ching*, or the "august city," about 6 m. in circ., surrounded by walls 20 ft. in height, and entered by 4 large, and 3 smaller gates. This section of the city comprises several idol temples, a depository of military stores, extensive public granaries, and a military seminary. It has also an artificial mountain in the centre of an extensive park. The third inclosure, or that called the "imperial city," contains the offices of the 6 superior tribunals of the empire. The Russian mission, the temple of *Yung-ko-Kung*, or "of eternal peace," the largest and most sacred edifice in the city, having connected with it an institution for the instruction of lamas for the service of Tibet. Here also is the National College, in which is concentrated all the learning and literature in China. All the literati of the empire, all the colleges and principal schools, are subordinate to this establishment, which nominates the examiners of the compositions required of candidates for civil offices. Manchoo, Chinese, and Russian literature meets here with equal attention, and all religions are sanctioned within its precincts. (*Gutzlaff's China Opened*, I. 65.) Indeed, it is somewhat strange that Peking, the cap. of the most exclusive empire in the world, should comprise, besides its numerous temples and pagodas, a magnificent mosque, a Greek church and convent, and a Rom. Catholic chapel!

The S. division of the city is the grand emporium of all the merchandize brought for sale from other provs.; and as this portion is not subject, like the other, to the rigour of military discipline, it is frequented by those who are in search of business, amusement, or repose. Its buildings do not, however, require any special notice. But it should be stated that it contains an enclosure, where sacrifices are offered up to the god of agriculture, and where the imposing ceremony of the emperor holding a plough annually takes place.

There are suburbs round most of the gates of the city, some of which extend more than a mile from the wall, and comprise several large temples, with a few other public buildings.

The streets are not lighted at night. Sir John Barrow says that the cross-lanes were generally watered, but that that did not appear to be the case in the main streets. A large sheet of water, comprising several acres, within the N. division, furnishes an abundant supply to that part of the city, and to the palace; and a small stream, which runs along the W. wall supplies that neighbourhood. There are, besides, numerous wells; but the water of some of these is dreadfully nauseous; and, when mixed with tea, the well water is, to Europeans at least, particularly disgusting. But good potable water is brought from beyond the barriers. (*Hyacinthe, Vile de Pékin*, p. 13.)

"Although Peking cannot boast, like ancient Rome or modern London, of the conveniences of common sewers to carry off the filth and dregs that must necessarily accumulate in so large a city, it enjoys one important advantage rarely found in capitals out of England: no kind of filth or nastiness, creating offensive smells, is thrown out into the streets, a piece of cleanliness that perhaps may be attributed rather to the scarcity and value of manure than to the exertions of the police officers. Each family has a large earthen jar, in which is carefully collected every thing that may be used as manure; when the jar is full, there is no difficulty of converting its contents into money, or of exchanging them for vegetables. The same small boxed carts, with one wheel, which supply the city with vegetables, invariably return to the gardens with a load of this liquid manure. Between the palace of Yuen-min-yuen and Peking, I have met many hundreds of these carts. They are generally dragged by one person and pushed on by another; and they leave upon the road an odour that continues, without intermission, for many miles. Thus, though the city be cleared of its filth, it seldom loses its fragrance. In fact, a constant disgusting odour remains in and about all the houses the whole day long, from the fermentation of the heterogeneous mixtures kept above ground, which in our great cities are carried off in drains. To counteract these offensive smells, they make use of a variety of perfumes, and strongly-scented woods and compositions." (*Barrow*, 98.) This statement is completely borne out by that of Hyacinthe, who speaks of the *puanteur insupportable d'urine* felt in walking along the streets.

About 10 m. from Peking is a large park, belonging to the emperor, having an extent of at least 12 sq. m.; it exhibits all the great features of nature, lakes and rivers, mountains, rocks, and forests thrown together in the boldest and most irregular manner. It comprises 30 distinct palaces, and a village of no inconsiderable size; but these palaces are ill-arranged, falling to decay, and wholly unworthy of the name.

The highest class of inhabs. is composed of the Manchoo troops and officers, most of whom are in poor circumstances, though a few possess considerable property. Next to these rank the Chinese merchants, many of whom are extremely wealthy; and below these are the artisans and other labourers, most of whom come from the provinces to procure employment. The poor are employed in cleaning and watering the streets, gardens, &c., and in cultivating the ground; but, notwithstanding the general discouragement of pauperism, and the severity of the police, it is alleged that there are in Peking many thousand persons, who, being without employment, have recourse to robbery and cheating. The cross streets are shut, and the others are patrolled at night; and in consequence, says Duhalde, *la paix, le silence, et la sûreté règnent dans toute la ville*.

Hired carriages and sedan-chairs are common in all the public thoroughfares; but the males of the higher classes almost universally ride on horseback, though many of them keep their private carriages.

Peking is indebted for its importance to its being the residence of the emperor and the seat of government; and a very large proportion of its inhabs. depend for subsistence on employment in one or other of the departments connected with the army, the administration, or the court. It is to China in respect of literature what Paris and London are to France and England. The printing and bookselling business is very extensive. A great many works, especially upon history, issue from the imperial press, and are sold at a low price to the booksellers. It is not distinguished by any peculiar manufacture, unless it be that of coloured glass; nor has it any foreign commerce or trade, other than that directed to the supply of its own wants. This, however, is necessarily very considerable. The country round the city being sandy and poor, a large portion of its supplies are brought from a distance, partly from sea by the Pei-ho, but principally by the Grand Canal and the Eu-ho, which connect it with Nankin, and most of the E. provinces. Mutton and beef, however, which constitute the principal food of the Manchos, are brought principally from Mongolia. The Chinese prefer pork; and hogs, consequently, form a principal article of import. Geese, ducks, and chickens, are the common domestic fowls; and in winter the shops are well supplied with partridges, pheasants, and other game.

A considerable portion of the taxes imposed on the different provinces is paid in kind; and a part of the rice and other grain so collected, being sent by canal to the capital, is stored in public granaries, whence it is issued to the troops, and others engaged in the public service. But notwithstanding this resource, it not unfrequently happens that the supply of corn proves deficient, and that numbers of the inhabs. are involved in the greatest privations. Tea, of excellent quality, is the common beverage; but they also use a strong spirit made of rice.

The Pei-ho is navigable for vessels of considerable burden to Peking, nearly 60 m. from the mouth, and it may be extended to Sea-borne boats to within 10 m. or 20 m. of the capital. Peking night, consequently, is easily attacked from the sea. There are no forts or other obstacles to the navigation of the river, which might be offered, with the greatest facility, by the aid of steam ships.

The early history of Peking is involved in obscurity, but it is generally regarded by native authorities as one of their most ancient cities. It is clear, however, from the statements of Marco Polo, who describes Peking under the name of Kambalu, that the M. Imperial, or Tartar city, was either built or removed by Kublai Khan. Marco Polo describes it, as it now exists, as having perfectly straight streets, lined on each side with houses and shops. The Mongol dynasty, founded by Kublai, continued to occupy this city till it was expelled from China, in 1367. In 1521 the third emperor of the Chinese dynasty of Ming transferred his residence thither from Nanke, since which it has been the cap. of the empire. (Marco Polo, by Marsden, lib. ii. cap. 7.)

PELEW ISLANDS. See art. PLELEWIS in this

country. The soil is very fertile in the S. it runs on a limestone and marble bottom, and is speaking generally very fertile elsewhere the soil runs mostly on a clay rock, and though not so fertile as the south it is still, with few exceptions, far from unproductive. Principal crops wheat barley and oats. Lime shells and or meal, may also at every where be had and in fact, were this as well farmed, it would be one of the most productive districts of the empire, but we regret to have to add that its agriculture is very far behind. There is a great want of stock, and of a proper rotation of crops, the land is often foul and exhausted and the implements of husbandry and the mode of using them are alike bad. Lately, however, some improvements have been introduced. Lenses for 14 years have been substituted for leases for three lives, and changes have been inserted in the laws for the preservation of cow cropping. Still a vast deal still remains to be done before agriculture in this and the adjoining Welsh counties attains to even a medium state of advancement. Owing to the great richness and fertility of the climate and the nature of the soil, this co. is extremely well suited for grazing and dairying, and a good deal is done in both departments, the cows used in the dairies are now generally a cross with the Ayrshire breed. There are some large estates, but property is notwithstanding a good deal subdivided. Farms are of all sizes, but mostly rather small. The moorland farms, however, and others are generally good and commodious, but many are still very inferior and very inconveniently situated. At a few of the older farm houses and many of the cottages have coal wells about 6 ft. in height, with a "cattle-and-dish" chimney, and are both warm and comfortable dwellings. Lately, however, they are gradually becoming less numerous, and will, it is to be hoped, be at no distant period wholly extinguished. Average cost of land in 1843, 11s 10d to acre. Anthracite coal, stone, and limestone are found in large quantities. Manufactures unimportant. Principal towns, Pembrake, Tynby, Harford, and St David's. It is divided into 7 hundreds, and 160 parishes, and returns 8 members to the H. of C., one for the co. and one each for the Harford, Tynby, and the Pembrake districts of Tynby. Right grant clerks for the co. in 1843-44, £2,016. In 1841 Pembrake had 18,873 total houses, and 88,000 inhab., of whom 48,000 were males and 47,700 females. Births contributed to the relief of the poor in 1847, 18,072. Annual value of real property, in 1843, £80,914, do. in 1844, 741,641.

PENNSYLVANIA, a part bar., market town, and one-part of S. Wales, on its own name, of which it is the cap., on the margin of Denbigh a creek on the S. side of Milford Haven. It is W. S. W. Carnarvon and 10 m. W. Llan-dun. Pop. of part bar. which includes the connected towns of Peterborough 104, 7912. The town is built on a tongue of land dividing the creek into 3 branches, one of which runs on the N. side, while the smaller branch bends southward under the suburb of Monkton. It consists of one long street, running along the edge of a hill, on

which are steep gardens; and, though it is the cap. town, its small size and general quietness give it more the appearance of a village. The parish buildings comprise a town-hall, custom house, and 3 churches, one of which is in the suburbs. St. Michael's, at the E. end of the town, is a cruciform structure of Norman architecture; St. Mary's is in the pointed style, and somewhat more ornamental. St. Nicholas, the parish church, is in the W. suburb of Monkton. The living is united in a single vicarage, in the gift of the Duke of Devon. There are several places of worship for dissenters, most of which, as well as the churches, have Sunday schools for children of both sexes. Pembrake has also a small endowed grammar school. On a high and rocky eminence W. of the town is the castle, an octagonal structure, nearly surrounded by water which, on account both of its situation and heavy ramparts among the most splendid manifestations of military architecture in the principality; it was built in the 11th century, and dismantled in 1646, after a brave defence by its royalist garrison. The keep is 30 ft. high to the dome, and 105 ft. in circumference at its base, the mean thickness of its walls being 16 ft. It consists of 6 stories, and is still covered in with a vaulted stone roof. About 5 m. N. W. the town, and within St. Mary's par., is Pembrake, now more extensively called Pembrake or Pembrake, from the government dock-yard immediately thither from Milford in 1844. It is pretty regularly built, and contains the houses of the persons connected with the dock yard. It has a handsome street plan, and many good shops, most of which, however, belong to the tradesmen of Pembrake.

The dock yard, which is defended eastward by a strong battery occupies about 60 acres of land, and when the improvements now in progress are completed, it will be one of the finest building yards in the kingdom, capable of having on the stocks, at once, five or six first-rate ships, and several others of smaller size. There is also a small private dockyard. A very fine jetty has recently been completed, and as ships of any burden may come up to the dock there can be little doubt that the importance of the place will rapidly increase, especially as the present establishment has lately been removed from Milford. The trade of Pembrake consists, at present, of ship-builders, people of small independent fortunes, and a few persons whose business is at Pembrake Dock. Pembrake serves, to a great measure, as a depot for the neighbouring district. Some coal is brought from a distance of about 6 m. eastward, and limestone and iron ore from Swansea, Llanelli, Newport, and the S. coast in general. The articles of export are confined to cattle, corn, and butter (the imports consist chiefly of articles of ordinary consumption). (Mans. Corp. and Bound. Rep.) The bar. of Pembrake was incorporated in the 10 Henry II., and is divided into two wards, under a mayor 5 other aldermen, and 16 councillors. It has likewise a commission of the peace, under a recorder. Corporation meeting, in 1843, 988. Pembrake returns 1 member to the H. of C., in connection with Tynby, Wion, and Milford. Registered electors of the united bar., in 1843-44, 948. The electoral limits of the bar. were last amended by the Boundary Act. It is also one of the polling places at elections for the co. A county court is established here, before which 400 plaintiffs were entered in 1843. Markets on Saturday (bars, April 12, Tynby Monday July 16, Oct. 16, and Nov. 20. (Manselton's Camb. Guide; Corp. Bound. Reports, &c.)

PENNSYLVANIA, a market town and par. of England, on Stafford, S. div. bound Cheshire, on the Penn. (a tributary of the Trent), crossed here by a stone bridge, 6 m. S. Stafford. Area of township, 14,400 acres. Pop. in 1841, 2,016. The town, which is very ancient, is supposed to owe its name to the Pennsylvanian of the Romans. The church, formerly collegiate, is a large building, in the early English style, with a square tower, the living is a curacy in the gift of Lord Lytherton. The Wesleyan Methodists and Baptists have libraries their respective places of worship with attached Sunday schools. There is also an excellent charity school, in which 18 boys and 6 girls are boarded, clothed, and instructed, and a national school, established in 1816, for which instruction is about 200 children of both sexes. Petty sessions for the bar. are held here; and Pembrake is one of the polling places at elections for the S. div. of the co. It is also the chief place of a poor-law union, comprising 31 par. Market day, bars, April 20, and first Monday in Sept. a very large horse fair.

PENNSYLVANIA one of the largest and most important of the U. States of N. America, between lat. 36° 40' and 40° W. and long. 70° 40' and 80° W.; having N. W. Lake Erie, upon which it has a coast line of 60 m.; N. and N. E. the state of New York; E. New Jersey; S. Delaware, Maryland, and Virginia; and W. Ohio. It is separated from N. Jersey by the Delaware River and the upper part of Delaware Bay, which also divides it with the Atlantic. Length, E. to W., 300 m.; average breadth nearly 100 m. Area estimated at 46,000

sq. m. Pop., in 1840, 1,724,022, of whom only 64 were slaves. The Alleghany Mountains occupy all the central part of this state, covering, with their ramifications, more than half its area. The W. and E. parts are comparatively level, the W. plain being by far the larger, and watered by the Alleghany and other tributaries of the Ohio, as the E. is by the Delaware and its affluents the Schuylkill, Lehigh, &c. The centre of the state is traversed by the Susquehanna. This river, the largest of those falling into the Atlantic in the U. States, rises in Oswego Lake (New York), near the sources of the Mohawk, and runs, with a very tortuous course, generally southward, till it falls into the bottom of Chesapeake Bay, lat. 39° 50' N., long. 76° W., after an entire course of at least 500 m. It receives numerous tributaries; but its channel is so much interrupted that it is but little available for navigation. Most of the other rivers in the state are obstructed. The soil in the E. is partly light and sandy, but in the interior plains and valleys it is a deep rich loam; there are few absolutely sterile tracts, and, in general, this is one of the most productive portions of the Union.

The climate is changeable; though, upon the whole, one of the most agreeable and temperate in the U. States. The season of frost and snow seldom exceeds three months; the winter commencing from the 1st to the 15th of December, and terminating from the 1st to the 15th of March. The heat of summer is seldom oppressive, except in low situations. Near the sea-coast the temperature of winter is severe, varying in the months of January and February from 14° to 24° Fah. The elevated parts are healthy; but the climate there is described as a compound of most others. "In spring it has the moisture of Britain; in summer, the heat of Africa; the temperature of Italy in June; the sky of Egypt in autumn; in winter the cold and snow of Norway, and ice of Holland; the tempests of the W. Indies in every season, and the monthly variable winds and weather of Great Britain."

Pennsylvania yields all the fruits and products of the N. and middle parts of the Union, and is better adapted for the culture of the mulberry and grape than the greater number of the other states. Most of the finer fruits of temperate climates are raised in the greatest luxuriance, and the cider is particularly excellent. Almost every variety of grain is raised, but wheat is the staple; and Pennsylvania is emphatically a wheat-growing country, the crop of 1840 having been estimated at above 13 millions bushels. Most branches of agriculture are in a comparatively advanced state.

"The whole district of country," says Mr. Stuart, "through which I travelled was equal in point of appearance of cultivation, and in the style and size of the farm-houses and office houses (generally of brick), to what is to be seen in the best districts of England or Scotland; but thorn hedges, and in general dropping trees, are wanting, even in this district, to make the picture of a beautiful English farm complete. The crops of rye and clover were particularly fine, and the gardens good, and in good order. In some respects, however, the farmers here have great advantages. They are all proprietors of the soil, and of course not liable to be removed; and in such easy circumstances, that every one of them keeps his own comfortable open carriage." (*Stuart's Three Years in America*, ii. 488, 489.)

Horses and cattle, especially the former, are particularly good; and this is, next to N. York, the principal wool-growing state of the Union. It is, also, remarkable for its mineral wealth, possessing vast quantities of iron, coal, and salt. Anthracite coal is found E. of the Alleghany, in fields extending altogether over a supposed area of 800,000 acres; and though, in 1824, the trade was in its infancy, only 9,541 tons being brought to market, it has since increased with such astonishing rapidity, that in 1834, 493,700, and in 1840, no fewer than 2,235,777 tons were brought to market! Bituminous coal is said to be found nearly everywhere W. of the mountains, and large quantities are consumed at Pittsburg, Cincinnati, &c., in the smelting of iron. Salt is obtained from springs to the amount of about 1,200,000 bushels a year. Marble, limestone, copper, zinc, &c., are also met with. Manufactures are both various and extensive. Pittsburg, in the W. part of this state, on the Ohio, is the Birmingham of the Union; besides ironmongery of every description, including steam-engines and machinery, cutlery, nails, stoves, &c., it has numerous other manufactures. (*See PITTSBURG.*) Cotton stuffs, and yarn, are extensively produced in Pennsylvania, which ranks, perhaps, next to Massachusetts, as a manufacturing state. The principal foreign trade of the state centres in Philadelphia; but it is partly also carried on through New York, Baltimore, and New Orleans, so that its total amount cannot be easily ascertained. During the year ending the 30th of June, 1849, however, the total value of the imports is stated in the official returns at 10,645,500 dollars, while that of the exports amounts to only 5,243,421 dollars, of which foreign produce re-exported made 492,549

dolls. During the same year there belonged to the state 281,633 tons of shipping, principally owned in Philadelphia.

Pennsylvania has a very extensive system of internal communication, partly effected by private companies, but principally by the state government. The grand canal between Philadelphia and Pittsburg, a distance of 295 m., connects the Delaware with the Ohio, and is second in importance only to the Erie Canal in the state of New York. It has, with its various branches, an aggregate length of 590 m.; and has, besides, 2 railroads connected with it, one, 82 m. in length, extending from Philadelphia to Columbia, and the other, 36 m. in extent, crossing the Alleghany, and uniting the E. and W. divisions of the canal. All these works belong to the state; the total expense of their completion having been nearly 4,000,000 sterling. (*Stevenson's Civil Engineering in N. America; Amer. Alm.*, 1841.) The principal private undertakings are the Schuylkill canal from Philadelphia to Port Carbon, 108 m. in length, with 129 locks, and completed at a cost of 2,500,000 dollars; and the Lackawaxen canal, 25 m. in length, with which a railroad is connected, the total cost of both having been 2,000,000 dollars. The coal districts are traversed by upwards of 100 m. of railroads. In 1848, 974 m. of railway had been undertaken in the state, of which 527 m. had been completed, at a cost of 22,745,290 dollars.

By the constitution as amended, in 1838, the legislative power is vested in a general assembly, consisting of a senate and a house of representatives. The mems. of the latter, of whom there are 100, are chosen annually in each co. by all the white free male citizens, 21 years of age, who have resided for a year in the state, and for 10 days immediately previous to election in the co. for which they offer to vote, and who have within 2 years paid a state or county tax. The senators, of whom there are 23, are chosen for 3 years, 1-3d being elected annually at the time of the election for representatives. The General Assembly meets every year in January. The supreme executive power is vested in a governor, who holds office for at least 3 years. Judges are appointed by the governor, with the consent of the senate, for terms varying from 5 to 15 years. The state is divided into 19 judicial districts; Harrisburg is the legislative cap., but Philadelphia the chief city. The other principal cities and towns are Lancaster, Pittsburg, and Reading. The state militia (with a few exceptions) consists of all free able-bodied white male citizens between 18 and 45; and, in 1850, included 276,070 individuals. Pennsylvania has a university, and had, in 1848, 9 colleges, with numerous academies and female seminaries, and 7,845 common schools, attended by 360,606 pupils. Total public revenue in 1848, 3,831,776 dollars, of which 1,580,555 dollars were produced by canal and railway tolls. Total public debt at the end of 1848, 40,424,737 dollars, annual interest on the same, 2,039,043 dollars.

The pop. of this state is very mixed, including a great number of Germans, &c., whose ancestors were originally attracted thither by the broad principles of toleration laid down by Penn. Religious creeds are no less various; Methodists, Presbyterians, Lutherans, Baptists, German Reformed, and Friends, are, however, the prevailing sects.

Previously to its conquest by the English, in 1684, this territory had been colonised by the Dutch and the Swedes. It was granted by charter to William Penn, in 1680, and taken possession of by him in the following year, and continued afterwards a proprietary government. Pennsylvania acted a conspicuous part in the revolution: the declaration of independence was drawn up in Philadelphia. (*American Almanack*, 1850; *Pitt's Geog. of the U. States*; *Darby*; *Bradford*, &c.)

PENRITH, a market-town and par. of England, co. Cumberland, ward Leath, in a valley watered by the Ramont and Lowther, which unite their streams about 1 m. below the town, 17 m. S. E. Carlisle, and 43 m. N. Lancaster. Area of par., 6,640 acres. Pop., in 1841, 6,429. The town, which mostly consists of a principal street along the line of road from Kendal to Carlisle, is clean and neat, built chiefly of red free-stone, much improved of late years. The church is a large and handsome structure, nearly rebuilt in the beginning of last century: on its walls are many curious old inscriptions, and in the church-yard is a rude monument called the Giant's Tomb, consisting of 2 stone pillars 10 ft. high, and 13 ft. apart. The living is a vicarage in the gift of the Bishop of Carlisle. The Independents, Wesleyan and Primitive Methodists, and the Secession church of Scotland, have also their respective places of worship, with attached Sunday-schools. A free-school was founded here by Queen Elizabeth, and there are several charity-schools. On an eminence W. of the town are the remains of Penrith castle, a square structure surrounded by a deep fosse and rampart: it is supposed to have been built during the wars of the roses, and was destroyed in the time of the Commonwealth. Northward is an excellent enclosed race-course, on which races take place

during the religious wars. (*Itoge, art. Doudgou; Des. Géog. &c.*)

PERM, an extensive gov. of the Russian empire, extending from the 54th to the 63d deg. of lat., and from 114 to 64 degs E long., having W the gov. of Viatka, and S that of Tobolsk. It is divided by the Oural chain into two unequal portions, the larger or that on the W side, being in Europe and the smaller or that on the E side, in Asia. Neither the area nor the pop. has been exactly ascertained, but the former may be taken at about 16,000 sq. miles and the latter at 1,000,000 or 1,200,000 individuals. More than 3-dths of the surface is covered with dense forests. The W side of the government is traversed by the Kama, one of the principal affluents of the Volga; the river on the E side of the Oural mountains falls into the Obi. The climate is very severe, and the soil beyond the 63d deg. of lat. is hardly susceptible of cultivation. The mines in the Oural mountains furnish employment to about 100,000 work-people, and yield large quantities of gold, silver, copper, iron, &c. (*See Russia*.) The corn produced in the government is insufficient for the consumption of the inhabitants.

Perm, the chief town of the government, is situated on the Kama, lat. 58° 1' N., long. 56° 27' 12" E. Pop. 10,000. It is built entirely of wood, and is the seat of an archbishopric, and has several public establishments. The inhabitants are principally employed in smelting the iron, copper, and other products, of the adjacent mines.

PERNAMBUCO, a city and one-part of Brazil inferior only to Rio Janeiro and Bahia in commercial importance, cap. prov. of its own name, on the Atlantic, at the mouth of the Capatubira, 310 m N E Bahia lat. 8° 4' 7" S., long. 35° 31' 40" W. Pop. estimated at 60,000. It consists of the separate towns of Olinda, Recife, Boa Vista, and St. Antonio; the first of which is on the mainland, and the others lie E from it on a peninsula of low sandy banks, separated by numerous creeks and different arms of the river, but connected with each other by two bridges. Recife, or Pernambuco proper the most easterly, about 4 m. S W Olinda, is defended by the principal forts, and comprises the dock yard and the larger merchants' warehouses. Most of its streets are narrow, its houses are chiefly of brick, and constructed from three to five stories in height, but usually less lofty. Several churches, the port admiral's residence, and the custom-house, are

of a value at this. Vessels trading with Pernambuco ought not to draw more than 10 ft. to 12 ft. water. (*Blount's American Coast Pilot, &c.*) The harbour is defended by several strong military works, the principal being the stone forts of De Surcouf, and De Brum, and has at its entrance a lighthouse with a revolving light.

The exports consist principally of cotton to the extent of from 20,000 to 30,000 bags a year; sugar to the extent of from 20,000 to 30,000 tons, and from 3 and 4 dyewoods. At an average the value of the exports may amount to from 1,000,000 to 1,500,000 a year. In 1800, 175 vessels cleared at Pernambuco for foreign ports, of which 75 were for England. The value of the imports from England, in the course of that year, was estimated at about 600,000, consisting principally of cotton and iron manufactures, hardware and cutlery, apparel and slave-warfare, &c.

PERNAU, a fortified one-part town of Russia, gov. Livonia, at the confluence of the Pernau with the W. angle of the Gulf of Riga, lat. 58° 31' 30" N., long. 22° 30' 16" E. Pop. 5,000. It comprises an old and a new town, and two suburbs, and has three churches, and a Latin school. There is a bar at the mouth of the river which can only be crossed by the smaller class of vessels, those of larger burden having to land and unload in the roads, where the anchorage is not very good. It has a considerable export trade, especially in iron, hemp and flax, &c., the aggregate value of the exports amounting to about 2,500,000 or 3,000,000 roubles a year.

PERONNE, a fortified town of France, dep. Somme, cap. arrond., on the Somme, 10 m E by N Amiens, Pop. in 1836, 3,000. It has a handsome town hall, a Gothic par. church, in which one of the Monrovingians kings is interred; but the edifice presenting the greatest interest is its old castle, in a tower of which Charles the Simple was confined by a count of Vermandois, and subsequently Louis XI. by Charles the Bold, duke of Burgundy. The latter circumstance forms the basis of one of the finest epics in French novel of *Quentin Durward*.

Peronne has been frequently besieged by the Spaniards, but unsuccessfully; and it had not been taken till it was stormed by the British about a week after the battle of Waterloo. At the castle of Appellcourt, near Peronne the famous "league" was concluded, in 1570, between Henry III. and the Duke de Guise. (*Itoge, art. Somme, Guide de l'étranger*.)

PERPIGNAN, a strongly fortified town of France, dep. Pyrénées-Orientales, of which it is the cap., on the Tet, where it is joined by the Rasse, 10 m S W Montpellier lat. 43° 47' 30" N., long. 3° 47' 30" E. Pop. in 1836, 15,504. It is built partly on a declivity, and partly in the plain beneath, and is separated by the Rasse from the *Montgiscard*, or the new town, and by the Tet from a suburb. Each river is crossed by a bridge, that across the Tet consisting of seven arches. The fortifications of Perpignan have been improved considerably since 1815; and it is now one of the best fortified towns of France. It is surrounded with walls of brick and stone, flanked by several bastions, and enclosed by ditches, ramparts which are numerous outworks. It is further defended by a citadel with a double line of ramparts, bastions and outworks, within which are the barracks and the castle, formerly the residence successively of the counts of Roussillon, and of the kings of Aragon and Majorca. The town is not well built, though improving. There are a few good streets and squares, and some pleasant public promenades; but the public thoroughfares generally are disagreeable to pedestrians, from being paved with small round stones. The cathedral is a handsome Gothic edifice, of the 14th and 15th centuries, 166 ft. in length, by 64 ft. in breadth, and remarkable for the beauty and richness of its nave and vault; which last is sustained without the aid of any columns rising from the area of the building. The old church of St. John, an edifice of the 11th century and several other churches, the Capitular, a defective work of uncertain date, but similar to structures erected by the Moors in Spain; the town-hall, mint, arsenal (formerly a large convent), theatre, hall of justice, and prison, are the other chief public buildings. Perpignan is a bishop's see, the seat of tribunals of ordinary jurisdiction and commerce, and of boards of artillery, engineers, and customs. It has a commercial college, a museum, a botanical garden, and a library of 15,000 vols., with manufactures of excellent silk, lace, cork, soap, and playing cards, and is an extensive entrepôt for the wine, brandy, liqueurs, &c., oil, oil, and other products of the S. of France. (*Itoge, art. Pyrénées-Orientales, Guide de l'étranger*.)

PERSEPOLIS (the *metropolis* of the anc. Persians), a celebrated city of antiquity, and during a considerable period the cap. of Persia, and residence of its monarchs, prov. Persistan, is a fine plain at the foot of a mountain, against which it stands, near the Arghun, or *Demondy*, 30 m. N.E. Shiraz; lat. 29° 30' 30" N., long. 50° 30' E. The

companion the residences of many of the richer inhabitants of the city, surrounded with gardens, various churches and convents, &c. Olinda is beautifully situated on small hills, the sides of which are alternately either broken down abruptly or covered with a most luxuriant tropical vegetation, amid which, the white cathedral, the convents and churches, the bishop's palace, and numerous villas, have a most picturesque effect. But Olinda is in a state of decay having been deserted by many of its pop. for Recife and the other parts of the city.

The harbour of Pernambuco is defended from the swell of the ocean by an extensive reef (*recife*), which, according to Lottin's estimate along the whole coast from Maranhão, at a variable distance from the shore, and has numerous branches, through which ships approach the land. This reef, which is said to be of coral, is in some parts 16 ft. broad at top, it slopes off more rapidly than the Plymouth breakwater to a great depth on the outside and is perpendicular within to many fathoms. (*Graham on Modern Pyrenees, &c.*) This natural break-water forms the harbour, for though at high water, the waves beat over it, they strike the quays and buildings of the town with diminished force. Along the sandy neck of land between Olinda and Boa Vista, however, which is uncovered by the reef, the surf is very violent, and the harbour itself is not considered very safe. It consists of 3 parts the Porto, capable of receiving vessels of 600 tons and upwards, entered across a bar on which there are from 17 ft. to 20 ft. water; and the *Montgiscard*, much better protected than the former, but on the bar of which there are but

city appears to have covered a large surface; bricks, fragments of walls, and rubbish being found widely scattered; but the only extant ruins of any interest or importance are those of a vast building, or rather series of buildings, supposed to have been the palace of Darius, burned by Alexander the Great.

It would be impossible, without the aid of plates, to give any intelligible description of these vast ruins. We may, however, state, that they occupy the summit of a platform about 1,430 ft. in length, 802 ft. in width on the S., and 926 ft. on the N. side, and about 50 ft. in height, formed by levelling the summit of a marble rock. This platform is ascended by easy flights of steps, cut into the rock on its W. side, and, when entire, consisted of 8 fronts or terraces, the mountain forming its E. side.

The ruins consist of the remains of vast portals or gateways (one of which is formed of two enormous sphinxes), pillars, walls, on which, but especially on the sides of the staircases, figures are cut in *basso relievo*, which are highly interesting as illustrating the costume and armour of the ancient Persians. Some of the remaining columns are 60 ft. in height, and though their capitals and form be very different from what we have been accustomed to consider classical, they are extremely beautiful, and many of the sculptures are executed with infinite spirit. Numerous tombs have been cut into the mountain, on which, as already stated, the palace abuts. (*Porter's Travels*, i. 582—683.; *Rich's Babylon and Persepolis*; *Niebuhr, Voyage en Arabie*, ii. 98—131.; *Mod. Trav.*, &c.)

Perhaps, however, the most curious portion of the ruins of this vast palace consists of the inscriptions in arrow-headed or cuneiform characters, similar to those on the bricks of Babylon, found in great profusion on most parts of the walls. Very discordant opinions have been entertained with respect to the nature and value of these characters; but Dr. Grotefend, who has bestowed the greatest pains on the subject, has shown that the cuneiform marks are real *alphabetical* letters; that every inscription is treble (the first being in Zend, and the others in different Persian dialects); that the inscriptions are to be read from *left to right*; and that all of them belong to the period between Cyrus and Alexander. Heeren considers that these characters are the *Ἀσσυρια γράμματα* mentioned by Herodotus (iv. 87.); but, in point of fact, notwithstanding the investigations of Grotefend, we are still far from being well informed as to the true meaning of these inscriptions.

The history of Persepolis is, for the most part, hidden in obscurity; but it seems to be an established fact that this city is identical with the *Istakhar* of Persian historians, the foundation of which is ascribed to Cyrus the Great, the *Jemsheed* of Oriental writers (whence the modern name of the ruins, *Takht-i-Jemsheed*). Herodotus, Ctesias, and the older Greek writers do not mention it, and it may not then have been a permanent royal residence. The inscriptions, however (if they have been correctly interpreted), show that it must, occasionally at least, have been visited by Darius, and the several monarchs called Xerxes. It is, at all events, certain that this city was the residence of the unfortunate Darius Codomannus, who, with his court, fled from it after his defeat at Arbela or Guagamela (anno 331 B. C.) by Alexander the Great. The conqueror soon after took the city, and gave it up to military execution. Alexander himself set the palace on fire, under circumstances which, if we may believe Diodorus, have been accurately as well as admirably depicted in Dryden's noble Ode. But Arrian, a far less questionable authority, has given a very different account of the matter. He states that Alexander destroyed this palace contrary to the advice of Parmenio, not in a drunken frolic, but in cold blood, and on principle, in retaliation of the destruction of the Greek temples by the Persians. (*Arrian*, lib. iii. cap. 18.) From the few notices that now exist, it appears that Istakhar was an important city under the Sassanian dynasty. In the 7th century it was taken by the Mohammedans, who, having founded Shiraz, made it the capital of Persia; and Persepolis, long on the decline, rapidly sunk to a state of total decay. It may be right to mention that Persepolis has been regarded by some writers as identical with Pasargadæ; and it may be fairly inferred, from the statement of Arrian (lib. iii. cap. 18.), that the palace destroyed by Alexander belonged to the latter; and though the question as to their identity be not free from difficulty, we are, on the whole, inclined to prefer this conclusion to the contrary theories of later writers.

PERSERIN, a considerable town of Turkey in Europe, pach. Albania, sanjak Scutari, near the Drin, at the foot of a mountain, 73 m. E.N.E. Scutari. Pop., according to the *Dict. Géog.*, 16,000; but, in Horschelman's *Stats*, it is stated at only 5,000! Its inhabs. are principally Arnauts, but partly, also, Mohammedans, and partly Christians. It is the residence of a Greek bishop, and of a military governor, who occupies a sort of no great import-

ance. Albania is said to be principally supplied with fire-arms from its factories.

PERSHORE, a market town of England, co. Worcester, hund. its own name, on the W. bank of the navigable river Avon, crossed here by a stone bridge, 7 m. S.E. Worcester. Pop. of its two pars. (exclusive of the out-townships), in 1841, 2,813. The town, which consists of one principal street, nearly 1 m. in length, is well built, and paved, having many respectable and a few handsome houses. The church of Holy-cross, formerly attached to a Benedictine monastery, of which there are still some remains, is a large cruciform structure, with a lofty square tower. That of St. Andrew is small and mean looking; both livings are in the patronage of the dean and chapter of Westminster. The Wesleyan Methodists and Baptists have their respective places of worship; and there are three Sunday-schools and a national school. Some of the inhabs. are employed in the manufacture of stockings; but the town depends principally on its retail trade for the supply of the neighbouring gentry. The petty sessions for the hund. are held here; and Pershore is the chief place of a poor-law union, comprising 40 pars.; the expense of maintaining its own poor having been 1,002*l.* in 1847. It is also one of the polling-places at elections for the E. div. of the co. Markets on Tuesday; fairs, Easter Tuesday, June 26., and last Tuesday in October.

PERSIA, a celebrated and very extensive country of central Asia, between the 39th and 36th deg. N. lat., and the 44th and 62d deg. of E. long. The political boundaries of the country have varied at different times with the character or exploits of its monarchs: sometimes embracing Armenia and Georgia on the W., Khârezm and Bokhara on the N., and Afghanistan on the E.; and sometimes being reduced to less than its natural limits. The latter on the S. are the Indian Ocean and the Persian Gulph; on the S.W. and W. the Tigris; on the N. the Aras, the Caspian Sea, and an indefinite line in the desert, that separates Persian Khorasan from the territories of Khârezm or Khiva, stretching from the Attrick, which falls into the Caspian, to about the 36th deg. of N. lat. and the 61st deg. of E. long.; whence a waving and undefined line, drawn southwards, separates the Persian territories on the E. from those of Cabul and Afghanistan. At present, however, the actual limits of Persia are much more circumscribed. The extensive province of Beloochistan, along the Indian Ocean, is quite independent. (*See* BELOOCHISTAN.) The Turkish territories embrace a large portion of country to the E. of the Tigris; and the country of Talash, to the S. of the Aras, belongs to the Russians. But still, even with these deductions, its area probably exceeds 450,000 sq. m.; though, from the vast extent of its deserts, the badness of the government, and the want of industry, the pop. does not probably exceed 8 or 10 millions.

Name.—The most ancient name of this extensive region is that of *Elam* (Genesis, x. 22.). The name of *Persia*, by which it was afterwards known in Europe, appears to have been derived from that of the prov. of *Fars*, or *Phars*, which being changed by the Greeks to *persis*, was applied by them to the whole country. This designation has not, however, been adopted in the East; the Persians, both in ancient and modern times, having styled their country *Iran*. The countries occasionally subject to the Persian monarchs beyond the Gihon, or Oxus, have usually been called *Aniran*, or *Touran*, that is beyond Iran. (*Ancient Universal History*, v. 49., 8vo. ed.)

Face of the Country.—Persia may be considered as an elevated plateau, diversified by many clusters of hills, chains of rocky mountains, extensive plains, and barren deserts, with two extensive declivities, or lower tracts—one along the shores of the Persian Gulph and the banks of the Shat-el-Arab, and the other along the shores of the Caspian. The more southerly portion of the former consists of a succession of sandy or gravelly plains, where water is so scanty that vegetation is only seen in patches where a well or a rivulet enables the inhabs. to irrigate some portions of the soil. This region is called by the natives *Dushitsan* and *Germesir*, that is, the hot country; and, according to Morier, "dreariness, solitude, and heat" are its principal characteristics: but in the province of Kuzistan, to the E. of the Shat-el-Arab, this low tract is comparatively well watered by numerous streams, and its upper portion is naturally very productive. The low country along the banks of the Caspian is extremely well watered, and is covered with forests and verdure: it unites on the E. with the desert, which stretches from the E. shore of that sea to the Tartarian steppes.

The plateau, or elevated space which lies between these two lower slopes, and which rests, as it were, on two great ranges of mountains, may rise to an elevation of from 2,500 to 3,500 ft. above the sea, and on this again chains of mountains rear themselves to various altitudes, seldom, however, exceeding 7,000 or 8,000 ft. above the sea, and including sometimes between their ranges valleys of va-

rious dimensions, and sometimes rather appearing as islands in the extensive plain.

The most striking features of Persia are its chains of rocky mountains; its long arid valleys without rivers; and, above all, its vast salt or sandy deserts.

Mountains.—There are two great chains of mountains, which, while they support the plateau of Persia on the N. and S., seem to be the stocks from whence all the minor ranges proceed. The most northerly of these, striking off from the Caucasus, crosses the Kur, to the W. of the plains of Mogām, and from Ardebil runs parallel with the southern shore of the Caspian Sea to Asterabad. It thence passes in an E. direction to Meshed, and, stretching S. of Balkh to the Hindoo Kōosh, is lost in the range of the Himalaya, and that stupendous central knot of mountains where the largest rivers of Asia take their rise.

This immense chain, in its extent of more than 20 degs. long., sends forth every where a number of branches, which in some places sink into the plains or deserts on the E. of Persia, and sometimes connect themselves with other elevations. Of these, the Sahund Mountains, striking off from the lake Urumeah in a N. E. direction, spread themselves over Azerbaijan, and connect more or less with the spurs and branches of that extensive aggregation of mountains in which the Euphrates, Tigris, Zab, and other large rivers, have their sources, and whence they derive their supplies. The range of the Taurus may be considered as a great branch from this central knot, which spreading out in all directions, covers the pachalics of Diarbekir, Erzeroom, Bayazid, Van, and Koordistan, with piles of immense mountains. These rise to a great height between the lakes Van and Urumeah, particularly to the W. of the latter, where the Peaks of Jewar are supposed to attain an altitude of 15,000 or 16,000 ft. above the sea. From this mass a chain of mountains, varying in height and breadth, runs S. E. through Koordistan, bounding at a distance the valley of the Tigris, forming the high lands of Louristan and the country of the Buchtiarees, and giving birth to the rivers Kerah, Karoon, Abzool, &c. After passing to the S. of Shiraz, it trends still more to the E., and following at uncertain distances the line of the Persian Gulph and Indian Ocean, and occasionally almost disappearing, joins the ranges of Beloochistan and Mekran, and finally sinks into the deserts of Sinde, or is lost in the high grounds which diverge from the mountains of Afghanistan.

From these two ranges may probably be traced every ridge or knot of mountains that cover Persia as with a network of rocky lines; though many even of those which attain a great degree of altitude appear almost insulated. Among the loftiest peaks may be mentioned that of Demawend, 50 m. N. E. Tehran, from 12,000 to 13,000 ft. above the sea; Elwund, near Hamadan, nearly as high; Sahund, near Maragha; the Koh-i-Zerd, near Isfahan, &c., which have not been measured. These mountains include among them an intricate system of valleys and plains, differing in size and productiveness, according to their nature and climate. Wherever water abounds they are fertile, but moisture is the boon of which nature is least liberal in Persia: except in some happy regions, even streamlets are rare, and of its few rivers scarcely any are navigable beyond a short distance from their mouths.

Rivers.—Though the Tigris, being assigned as one of the natural boundaries of Persia, can scarcely be set down as a Persian river, there are many large streams which descend from the Persian mountains to feed it. Of these the principal are the Karoon, supposed by D'Anville to be the *Choaspes* or *Eularus* of Herodotus, the Ulai of sacred writ; but Kinneir supposes that the Kerah, or Karasū, represents the *Choaspes*; and that the greater and lesser Zab, which have their sources in the chain of Zagros and the mountainous districts of Koordistan, are the ancient *Caprus* and *Zabelus*. On the N. the Arras, or Araxes of classical writers, though a boundary line of the present Persia, derives much of its waters from Persian Koordistan; and the salt lake of Urumeah receives from the same hills, and from the Sahund mountains, a number of streams. The provs. bordering the Caspian are as remarkable for their moisture as the rest of the country is for its aridity; but their rivers are chiefly torrents, sometimes full and foaming, at other times nearly dry. The Kizillozein, which rises in Ardalan, and passing by Miana falls into the Caspian in the prov. of Ghilan; the Herauz, which flows through Amol; and the Tejen, which passes by Saree, both in Mazunderan, are the largest. The Attruck and Goorgan, both considerable streams, falling into the S. E. corner of the Caspian, are fed from the N. face of the Elbrus of Astrabad. It is a singular fact, as Sir J. Malcolm remarks, that from the mouths of the Indus to those of the Karoon and Euphrates, there is not found one river navigable more than a few miles from the ocean; and, in fact, the rivers that fall into the Persian Gulph and the Indian Ocean, on the shores of Laristan and Kerman, are mere torrents, almost dry during the long period of the summer and autumn heats.

Lakes.—In a country so arid there can be but few sheets of standing water, and those which do exist are chiefly salt. Of these the lake Urumeah or Shakes, in Azerbaijan, near the frontiers of Turkey, 36 m. W. Tabrees, is the most remarkable, both for size and intensity of saltiness. According to Kinneir, it may be about 300 m. in circumference, and it has several islands. So saturated is the water with the salt it holds in solution, that immense quantities are deposited, assuming the appearance of a pavement under the shallow water near the brink, and its shores are covered with saline efflorescence. Its waters, like those of the sea, appear to be dark blue, streaked with green, and are pellucid in the highest degree. The lake of Baktegan, near Shiraz, is another of these sheets of salt water, but on a smaller scale; as is the lake Zurrah, in Seistan. Excepting small pools among the mountains, which are the well-heads of streams, there are no lakes of any considerable size; but on the banks of the Caspian Sea, the beating of the surf, by damming up the mouths of streams, has given birth to some extensive lagoons.

Deserts.—Those which are the most striking of its physical features, Persia shares with a large portion of Central Asia and Africa: they consist of salt deserts, called by the natives *Kaweer*, and sandy wastes called *Sakra*. The great *Deria Kawer*, or salt sea, as it is called, is of prodigious dimensions, and may be said to be to Persia what the great desert of Sahara is to Africa. It commences on the N. at the foot of the Elbrus mountains, in about the 36th deg. N. lat.; and, uniting with the desert of Kerman, extends S. to about the 30th deg.: on the other hand, it extends from about the 51st to the 60th deg. of long., occupying all the central and eastern portion of the country. It has a few oases, or cultivated spots; but they do not amount to 5 per cent. of its extent. The cultivated portions of the country lie round the margin, as it were, of this vast desert plateau, principally to the N. W., W., and S. W., but partly, also, as already seen, to the N., along the Caspian. S. of the desert is Beloochistan, and E. Afghanistan.

The nature of this desert varies in different places. In some the surface is dry, and even produces a few saluginous plants; in others, it is covered with a crackling crust of earth, white with saline efflorescence. A considerable portion is marshy; and during winter the melting of the snow and the increase of the torrents cause an accumulation of water in its lower parts, which, being evaporated in the hot months, leaves behind a saline incrustation in cakes upon a bed of mud. In extensive tracts sand predominates, either in the shape of level plains or wave-like hillocks, easily drifted by the wind, and sometimes so light and impalpable as to be carried to a vast distance by tempests. In some places the plain surface is broken by ridges of bare black rocks. Nothing can be more dreary than these dismal wastes. When the traveller has advanced some distance into them, the boundless expanse around, blasted with utter barrenness, and hoary with bitter salt, glistening and baking in the rays of a servid sun, only broken here and there by masses of dark rock, distorted by the powerful refraction into a thousand wild and varying forms, impress him with a sense of desolation that cannot be described.

Forests and Appearance of the Country.—Although the greater part of Persia is bare of vegetation, there are a few tracts exempted from this sterility. Among these are the provinces of Ghilan, Mazunderan, and Asterabad, bordering the Caspian Sea. The strip of low land constituting these provinces, with the N. face of the lofty mountains by which it is overhung, is covered with dense forests of oak, elm, beech, sycamore, and all sorts of fruit trees, amongst which the vine grows with the greatest luxuriance. The swamps and back waters are bordered with alders of magnificent size, and amongst the underwood is found abundance of box, of a magnitude unknown in Europe. In the S. the chain of Mount Zagros, including Persian Koordistan, Louristan, and the Buchtiaree mountains, is partially covered, and in many places densely, with forests of oak, which, however, does not attain any great size; and parts of Kuzistan are overrun with low jungle, the haunt of wild beasts. The district of Behaban is rich in wood; and Kinneir praises highly the beauty of the finely-wooded vale of Ram-Hormuz in Upper Kuzistan. But except in those districts, which bear but a small proportion even to the inhabited portions of the country, its appearance is dreary in the extreme, and lacks almost every thing that gives interest and beauty to European landscapes. It has no green plains or grassy slopes, no parks nor inclosures, no hedges nor woods, no magnificent seats nor comfortable-looking cottages, and, excepting in spring, even the portions cultivated round the villages can hardly be distinguished from the brown, arid expanse, that every where meets and fatigues the eye of the traveller. And if the reader will further figure to himself towns and villages, consisting mostly of mud houses, partly in a state of decay, and many of them wholly deserted; roads, if so we may call wretched paths,

wholly impracticable for carriages, and unsafe even for horsemen; property insecure, and tyranny and rapine every where lords of the ascendant, he will be able to form a pretty accurate notion of the state of this celebrated country. (*Fraser's Persia; Edinburgh Cabinet Library*, p. 29.; *Kinncir's Persia, passim, &c.*)

Soil.—Lime in various shapes abounds every where, and being mingled in the glens and valleys with the remains of decayed vegetables and other detritus, forms a loamy soil of inexhaustible fertility. Indurated clay is often found to mingle with the calcareous matter. Artificial irrigation is here, almost every where, essential to the raising of crops. It is, in fact, the great business of the Persian agriculturist: and is well understood, having been practised from the remotest antiquity. Wherever, indeed, it is neglected, the land is, for the most part, barren and unproductive.

Climate.—This is found to vary to almost the greatest possible extent in different provinces; and the statement of the Younger Cyrus, that one extremity of his father's dominions stretched into those climates that were uninhabitable through heat, and the other into those uninhabitable through cold, is nearer the truth than might be supposed. The summer heats in the S. provs. are almost insupportable; while the cold of winter in those of the N. rivals that of Canada or Russia. In summer, however, even in the N., the heat is so great that all who can leave the towns and villages of the plains in the months of June, July, August, and September, resort to temporary lodgings or tents in the mountains. In the low provs. on the Caspian, the heat, though great in summer, is not so excessive as in the S., partly perhaps from the evaporation that takes place, as well as from the breezes from the sea: but the climate is here extremely unhealthy, and in the end of autumn putrid and intermittent fevers prevail to a great degree.

Minerals.—The mineral riches of Persia are almost wholly unexplored. Iron, copper, and lead are, however, known to abound in all the great mountain ranges. The first is not largely produced, and much of the required supply is imported from Russia. Copper has been worked in several places, particularly in Khorasan and Azerbijan; but the distracted state of the country has hitherto prevented much progress being made in such undertakings. Of late, however, an enterprising native, whose mind has been enlarged and his knowledge improved by a residence in England, has commenced working mines in Karadang under favourable appearances of success; and, from the connections he has formed, he may perhaps escape the extortions to which others of his countrymen would probably be exposed. The mines of Fars and Kerman supply the greater part of the demand for lead, though some is also brought from India. Antimony is found, but is little used. Gold and silver are said to exist, but there are no mines of either worth notice. The turquoise is almost the only gem found in Persia, to which it is peculiar, the mines near Nishapour yielding this precious stone in an abundance and of a beauty unknown in any other part of the world. It is found disseminated in veins, nodules, and irregular masses, in beds of porphyritic conglomerates or limestone deeply tinged with iron, and often veined with micaceous iron ore. Garnets are also found in various parts, especially near Hamadan, of great size and beauty. Rock salt is very abundant all over the country; and the mines of Khameer furnish abundant supplies of sulphur, which is also found in other places. Coal has been discovered in Azerbijan, and naptha is abundant, cheap, and useful.

Vegetable and Animal Productions.—As Persia embraces a variety of climates, its vegetable productions necessarily vary in different parts. The climate of many of the northern provinces resembles that of Europe, so that most European fruits and vegetables are found there in great perfection and abundance, with several belonging to more southern latitudes. The forests of European trees, that cover the Caspian provs., and the woods that more thinly cover the southern mountains of Louristan and the Buchtiarees, have already been noticed; and to these may be added the stately chinár, or *Platanus orientalis*, the Lombardy poplar, willow, jujube tree, and, in the warmer parts, the cypress and pinaster. The plains are covered with a stunted and prickly herbage, among which the camel-thorn, wild liquorice, wild rue, and many aromatic plants, are conspicuous. Among the rest, the tall stalk of the gum-ammoniac rears itself on most of the gravelly plains of Irak and Khorasan, dropping its bitter tears upon the waste. The assafoetida plant abounds in parts of Khorasan. The orchards of Persia are rich in all the fruits of Europe: cotton, tobacco, the opium poppy, figs, vines, and the mulberry, abound every where. The Palma Christi (castor-oil plant) is reared for lamp-oil in the warm districts, and the manna-bearing tamarisk is found in many low moist spots.

Among the animals are found most species common to Europe, with the addition of the camel, wild ass, wild sheep (or Argali), lions, tigers (rarely), leopards, hunt-

ing leopards, tiger-cats, lynxes, and hyenas. There are many celebrated breeds of horses, of which those of the Toorkman plains and the Chaab district are held in highest repute. They have been a good deal improved by crossing with Arab horses, and though not handsome, at least in the estimation of Englishmen, have great strength, speed, and the most extraordinary powers of enduring fatigue. The Persians are extremely fond of, and take great care of their horses. They are clothed with the greatest attention, according to the season of the year; and in warm weather are put into the stable during day, and taken out at night. Next to camels and dromedaries, mules are in greatest repute as beasts of burden, and form the bulk of the caravans employed in transporting goods from one part of the country to another. There is a great variety of birds, and the Caspian is well supplied with fish.

Persia is not, in general, much infested by reptiles or insects; but the black scorpion and large centipedes are met with in various parts, and the plains in some places swarm in summer with immense Phalangii and enormous spiders, the bite of which is venomous. The stories of the poisonous bug of Miana are believed to be grossly exaggerated; but no words can exaggerate the swarms of gad-flies and other stinging insects which set upon the traveller who enters the jungles of Mazunderan in summer, nor the clouds of mosquitoes which are bred in its swamps and other low marshy parts of the country. Hosts of locusts, too, occasionally visit the land, destroying every green thing, and themselves supplying food to myriads of wild fowl.

Tenures of Land, and Agriculture.—Property in land is of a fourfold description: 1st, *Khalissa*, or crown lands; which, since the confiscations of Nadir Shah, have become very extensive; 2d, those which belong to private individuals; 3d, those granted to charitable or religious institutions; 4th, those granted by the king for military service, or in payment of salaries or annuities. Persons may become proprietors of land by inheritance, by purchase, by gift from the crown, or by reclaiming it from waste by producing the means of irrigation. In any of these cases, except the third, the proprietor's right (he not being the occupant) amounts to the privilege of exacting from the cultivator a tenth part of the produce. In the third case—that of being an assignee of crown lands—he may exact 3-10ths, which include all government dues, and what he can get from the farmers. If the assignment be on the estate of another, he can only demand 2-10ths. If the proprietor be the occupier of his own land, he makes what bargain he pleases with his cultivators; but the regulations for the protection of the husbandman have little or no practical influence. Almost the whole expense of government has to be defrayed by taxes on the land, the amount of which is perpetually varying, not only with the necessities of the government, but with the character and dispositions of the governors of the different provinces. The state of the country is such that "the cultivator rarely expects to reap the fruit of his labours. His lands and houses are liable to be plundered by the retainers of every petty chief; and he and his family may, in an instant, be deprived of all their little capital, and reduced to beggary and want." (*Kinncir*, 37.) Under such circumstances, agriculture must necessarily be in the most depressed possible state. No improvement is ever dreamed of; only the most easily worked portions of the soil are cultivated, and the instruments of husbandry are of the rudest and most primitive construction. Such, however, is the fertility of the land, that, despite the want of skill and attention on the part of the husbandman, wherever the means of irrigation can be commanded, from 10 to 20 returns of the seed are said (though we attach little weight to such statements) to be usually reaped, and in many places the produce reaches fifty and sixty fold. The grains chiefly cultivated are wheat, barley, maize, and rice; the latter being most abundant in the low and well watered provs. of Mazunderan and Ghilan. Oats are very little, if at all, raised. In the greater number of provs. there are two sorts of cultivation, wet and dry, or by means of irrigation and without this assistance. In the former, which is also by far the most extensive, the ground is roughly turned up by a wooden plough, sometimes slightly shod with iron, and drawn generally by two oxen; and the seed being harrowed in, the fields of each individual are laid under water as frequently as may be required, or as he has a right to; for the water of each stream is portioned out by *time* into shares, which are bought and sold as property. The water is derived either from natural rivulets or from under-ground canals, constructed with great skill, and carried to a great distance. These are the property of those who construct them; the natural streams belong to the sovereign, or to those who have purchased them, or on whom they may have been bestowed. All disputes about irrigation, like those on other subjects, are settled by the *kethkoda* (magistrate) or elders of the village. The dry cultivation is conducted, as to tillage, in nearly

the same way as the other, but the grain is left to be nourished by rain only; so that, in this arid country, it must be confined to particular spots which experience or observation have pointed out as fit for it. Manure is very rarely applied to corn-land. Near cities, the melon, cucumber, and vegetable grounds are enriched with manure from the soil of the caravanseras, &c.; and in the neighbourhood of Ispahan pigeon dung is so highly valued in the culture of the fine melons, for which that district is celebrated, that pigeon-houses are built for the purpose of collecting this manure, which sells at an enormous price; but these are almost the only instances in which the land is artificially assisted. The use of lime as a manure is unknown in this, as in other Asiatic countries; and fallows appear to be the only means resorted to for the improvement of the land.

Sheep, particularly the large-tailed variety, are every where very abundant. Their flesh is almost the only meat used as food, exclusive of poultry and game; beef not being at all esteemed, nor of good quality. Sheep's wool is universally used for clothing, and sheep skins with the wool on, for jackets and cloaks. The property of the wandering tribes of Persia consists of sheep, with cattle, horses, camels, asses, &c., in large flocks and herds. Wool might become a very valuable article of export. In Kerman they have a breed of goats which yield a down, not much inferior to the Cashmere wool, which might be greatly increased all over the mountainous parts of the country.

Manufactures are chiefly confined to articles of home consumption. Till lately almost all the clothing of the poorer classes, both cotton and woollen, was home-made; but for some years past most of the coarse chintzes and printed cottons in use have been supplied from England and Russia by way of India, Turkey, and the Caspian. Still a great deal of cotton cloth is made, both plain and printed, some of which goes to Russia and Turkey. In silk, also, a good deal is done, the fabrics resembling our gros-de-naples, taffetas, satins, velvets, brocades, and handkerchiefs, &c., produced at Cashan, Yazd, Mushed, Astrabad, Ispahan, and many other places, are not only celebrated, but in request for export to Russia and Turkey, as well as for home consumption. Besides these, shawls are manufactured at Kerman, of the wool of that country, in imitation of those of Cashmere, and which, though deficient in softness and fineness, are still a handsome fabric, and in great request both for home use and exportation. Carpets and felts for sitting on are also made in various parts, the best of the former being produced at Herat, and in the central districts of Irak, and generally by the wandering tribes. The best are made in Khorasan; but they are chiefly for use in the country, few being exported. There are also manufactures of arms, swords, daggers, guns, and of cutlery, as scissors and knives. The former are chiefly made at Shiraz and Mushed; the guns of Kermanshah, and its vicinity, are highly prized, and the cutlery of Ispahan and Shiraz has obtained some celebrity in Persia; but the knives and scissors of Birmingham are so far superior in cheapness and quality, that there is no great demand for the native wares. China ware, and all superior pottery, is imported; but a little coarse glass is manufactured in the country. There is also a manufactory of leather and saddlery at Hamadan.

Commerce.—In a country where there are no made roads, navigable rivers, or canals, and scarcely any sea-ports or shipping, and where there is but little security of property, it might be inferred that there can be no commerce. Yet, with all these disadvantages, Persia has a good deal of trade, and there is no inconsiderable degree of commercial spirit among its inhabs. The means of land-carriage, as over most of the E., is by caravans of camels, mules, and small horses, called Yaboo, for there is not a wheel carriage in the country. The two latter are particularly suited to the stony roads and high mountain passes which occur in almost every day's journey; and in this way is brought the whole merchandize from Bokhara, Caubul, much of that from India, and from all the nearer countries, to the various marts; the returns being transported in like manner. The only sea-ports are Bushire, Bunderabbas, or Gomeroon, Congoon, and some still smaller places on the Persian Gulph; and Euzellee, Balfroosh, and Astarahad, upon the Caspian. Of these Bushire, on the Gulph, and Balfroosh and Euzellee on the Caspian, are the most considerable, the former being the mart of all the trade with India, and the two latter of that with Russia; and from these the communication with the interior is kept up by caravans, as already mentioned.

The principal trade of Persia is with India, Turkey, Russia, Bokhara, and Afghanistan, and of late direct with England. From the first the imports are chiefly indigo, chintzes, muslins, and calicoes, gold and silver brocades, precious stones, china, and earthenware. Sugar and sugar-candy, cashmere shawls, iron, lead, copper. From Turkey, European goods from the Le-

vant, and specie. From Russia, iron, broadcloth, coarse and fine printed calicoes, gold lace and metal buttons. Trunks of all sizes; tea, coarse cutlery, leather, glass-ware, tea-urns, and copper in sheets, quicksilver, furs, paper, in great quantity; cochineal, &c. &c. From Bokhara black lambkins, raw hides, dried prunes, rubies, and other gems; shawls, china ware, camblet; Indian and Russian produce by that route. From England broad cloths, and narrow woollens of all sorts; cotton manufactures, imitation shawls, jewellery, arms, cutlery, watches, spectacles, earthen and glass-ware, iron, tin, copper, &c. &c. From Arabia coffee, pearls, horses, &c.

The exports are chiefly to England, silk, gall-nuts, a little wool, madder, yellow berries, occasionally a few pearls and precious stones, and specie to be converted into bills at Constantinople. To India, specie, dried fruits, tobacco, wine, drugs, dates, sulphur, torquosies, Kerman shawls, rose-water, swords, horses, greyhounds, raw silk; copper (from Turkey), saffron, &c. To Turkey, grain, raw silk, tobacco and pipe-sticks, cotton, lamb and fox skins, carpets, silk manufactures, cotton do., salt, sheep; besides foreign articles in transit from India and Bokhara. To Bagdad much the same as to Turkey; to the Uzbecks and Turkmen, Kerman shawls, and woollens; silk stuffs, gold embroidery; copper ware from Cashan. Cotton goods, arms, Hamadan leather shoes, and clothes, torquosies; sugar, raw and refined, opium, and some Indian goods; to Arabia, wheat, dates, dried fruits, rose-water, cloaks.

To Russia, raw silk and cotton, rice, grain, timber, tobacco, raw hides, lamb-skins, fish, gall-nuts, naphtha, drugs, torquosies, Kerman shawls, silk and cotton goods, brocades, besides foreign produce, as Cashmere shawls, pearls, &c.

Where no official records are preserved, where every art is put in practice to disguise the true amount of imports and exports, and where, also, the existing state of things is always changing from external or internal causes, it is impossible to arrive at any just estimate of the value of commerce. In 1820 the export trade of Persia was estimated by Mr. Fraser at about 1,225,000*l.* a year. Since then the imports have undoubtedly increased, in spite of great distress in the country from three years of plague and famine; for, in 1835, from the best materials that can be collected on the subject, they appear to have nearly amounted to 3½ millions sterling, and the imports of 1835 to Trebizond, of European produce, the greater part of which finds its way to Persia, exceeded a million sterling; and there is every reason to expect a gradual increase from all quarters, though doubtless liable to occasional fluctuation.

Shipping.—Scarcely any vessels belong to Persian owners. The trade between India and the Gulph is carried on in bottoms belonging to Indian, Arab, or Armenian merchants resident at the sea-ports; and that of the Caspian, in vessels from Astrakhan. The Russian government discouraging any vessel in that trade which is not owned by one of their own subjects, the Persian or Armenian merchants who have embarked in it generally become subjects of Russia, which leads to their ultimate residence in Astrakhan. There are, however, some vessels, of from 50 to 150 tons, built at Euzellee.

Money.—The coins chiefly current in Persia are bajo-gees, or Persian ducats; sahebkerans, commonly called koroonees, a silver coin, nine of which go to the bajo-gee; and copper coins, called pool-e-slah, or black money. There are also several pieces of one or more abbasees or shahees, the abbasee or shahee being the fourth or fifth part of a koroonee; there are about four pool-e-slahs in an abbasee. The old toman of gold, and real or rupee of silver, are now seldom seen, although used at times in calculation; the toman being equal to 10 koroonees, or 8 reals. Except the Russian or Austrian ducat, which is in common use, there is little foreign coin now current.

Races.—Population.—The ancient Persian stock has been much intermixed in the course of ages by the settlement of other races in the country, especially by the influx of Greeks during and after the conquest of Alexander the Great; and more recently by that of Arabs and Turks. Still, however, the distinguishing characteristics of the family appear to be pretty well preserved. The complexion is fair, but not transparent, and there is little or no colour in the cheek. Hair long, straight, and almost always jet-black; beard abundant, bushy, generally black, but now and then with a reddish tinge. Features regular and handsome, though generally minute, and, excepting the beard, rather effeminate. Stature little short of the European standard; body gracefully, but not very strongly formed, being, altogether, less robust than that of the European. Though early civilised, they have made no considerable progress in arts, science, or arms; and though remarkably clever, and not deficient in bravery, they have never been able to establish any thing like a free system of government, or to set any limits to the caprice and tyranny of their rulers. They have occasionally gained

some advantages over other Asiatic nations, but they have never been able to oppose any effectual resistance to Europeans. In antiquity, a small army of Greeks overthrew the Persian empire when in the zenith of its power; and, in more modern times, it has been overrun by the Arabs, and even the Affghans. At present it owes its existence to no intrinsic vigour of its own, but merely to the forbearance and jealousies of its enemies. The Persians have, in fact, contributed nothing to the improvement or civilisation of mankind; and excepting Zoroaster, have not produced a single benefactor of his species known to history.

At present the pop. of Persia may be divided into two distinct classes, the fixed and the nomadic. The first comprise all who live in towns and villages, and have fixed habitations; the second consists of the various tribes, indigenous and of foreign extraction, who lead a pastoral and erratic life, having no regular habitations. But the whole body of the people may more conveniently be divided into four classes: first, those who are attached to the metropolitan and provincial courts, including the functionaries of government and military; second, inhab. of towns, comprising merchants, shopkeepers, artisans, with men of the religious orders, of business or of learning; third, those employed in agriculture; and, fourth, the tribes, including the *Kelleats*, or *Illyats* (dwellers in tents), or nomades.

The officers of court are more remarkable for skill in business, versatility, politeness, and courtesy, than for probity, honesty, or good principles. Forced, in self-defence, to dissemble and control their feelings, they do so successfully, and, looking to wealth as the best means of purchasing favour in the day of adversity, as well as of enjoyment in prosperity, they stick at no means by which it may be acquired. Accordingly, they become, in general, great intriguers; and are at once deceitful, sensual, venal, treacherous, and, when they dare, arrogant and overbearing. Ministers of state are generally selected from among the men of business or meezas, who, though less arrogant than the nobles, are equally corrupt and immoral: they do not assume so much state as military chiefs, and are distinguished by a roll of paper stuck in their girdle, instead of a sword or dagger. One remarkable class of court dependants are the royal gholams, or body guards, the confidential and devoted guardians of the monarch's person; whence the name *gholaum*, or slave. They are usually either Georgian captives or sons of respectable families; and resemble somewhat the *mousquetaires* of the old French government. They are employed in lucrative and confidential services, and the situation is much sought after; but their tyranny and dissoluteness know no limits, and the arrival of a gholam-e-shah in a district, creates a sensation not unlike the attack of a pestilence.

The towns-people, *sheherees*, as they are called, are a mingled race of all those which have ever conquered or had intercourse with Persia, grafted on the original stock — Turks, Tartars, Arabs, Armenians, Georgians. They are a more industrious and less depraved class than the first; but being nurtured in falsehood and deceit, they are adepts in these vices, being at the same time, however, cheerful, polite, sociable, kind masters, and good servants. The merchants are numerous and often wealthy, and, having more intercourse with foreign nations, are usually of more cultivated and enlarged minds than others of their countrymen. The shopkeepers are, of course, a grade lower.

The ecclesiastical body, which is also numerous, is, with some rare exceptions, more remarkable for hypocrisy and profligacy than for piety and morality; originating, most probably, in the want of a suitable provision to live on, and the consequent necessity of practising fraud and imposition.

The cultivators of the soil are those on whom the tyranny of their rulers falls most heavily; yet it cannot be said that they exhibit much misery. They are themselves, as well as their wives and children, for the most part sufficiently, though poorly, clad, and have abundance of wholesome, though coarse, food, as wheat or barley bread, cheese, sour milk, rice, &c. &c. Extortion and tyranny are met, as usual, by cunning and deceit; and, as the peasantry are active and intelligent, they contrive to avoid being completely fleeced.

The fourth class is an interesting and extensive one. It consists not only of the native nomades of Persia, who occupied the south-western and southern ranges of mountains long before the Mohammedan conquest, but of all those of Nomadic origin who came with the various conquerors that have overrun the country since that era, as the Arabs, Ghiznavides, Seljook Toorkmans, Moghuls, Toorks, Uzbecks, &c. But the greater number consists of those of Arab and Turkish origin, particularly the latter. It may be remarked, as a singular anomaly, that these nomadic tribes supply not only the principal military force of the country, but, as a consequence, probably, its only hereditary aristocracy, and, generally, its sovereign himself. Of these tribes, a

portion is always approximating more nearly to the habits of fixed life; but the greater part by far are strictly nomadic, living in tents, which they shift from place to place, according as lack of pasture for their flocks and herds, or change of season, suggests. In these their wealth consists; and though many of them cultivate a little grain, they live by the sale of the surplus of their stock, and by their produce in milk, wool, and flesh. Their character and habits are every where much the same. Being poor, they are frugal and abstemious; and unaccustomed to more civilised manners, they are rude and blunt, fond of independence, and passionately fond of martial exercises, of the chase and war. Predatory both from inclination and education; but hospitable, comparatively honest when their faith is pledged, and brave. Their chiefs, seen among their own people and in their own country, appear to great advantage, as frank, liberal, and generous, though hasty and passionate; at court they are constrained to assume somewhat of the manners of the place, and do not shine so much as at home.

The koords come under the denomination of the "tribes," though less erratic in their habits. They claim a high descent; some pretending to be the descendants of the genii of the air by terrestrial women, and others the progeny of certain persons saved from the tyranny of Zohauk. But their antiquity is unquestionable, and, probably, they may be descendants of the Carduchli described by Xenophon.

The Toorkman tribes, inhabiting the desert on the N. of Khorasan, are likewise to be reckoned among the eelleats of Persia. They are wholly addicted to robbery and pillage, their chief occupation being that of making plundering parties, which destroy whole villages, carry off the inhabs. into slavery, and their cattle and property. But to enumerate, far more to describe, the various nomades of Persia would greatly surpass our limits; and we must refer our readers, on this interesting subject, to works where it is treated of at greater length.

National Character. — In general, it may be said of the Persians that they "are handsome, active, and robust; of lively imagination, quick apprehension, and agreeable and prepossessing manners. As a nation they may be termed brave; though the valour they have displayed, like that of every other people in a similar state of society, has, in a great degree, depended on the character of their leaders and the nature of the objects for which they have fought." (*Malcolm's Hist. of Persia*, ii. 638.) Unhappily, however, their vices are far more prominent than their virtues. Though the despotism to which they are subject be similar to that which weighs down all the Eastern nations, they have a peculiar and distinctive character. As compared with the Turks, they are not unlike what the Irish are as compared with the English or the Scotch, being gayer, livelier, more active, more versatile, and less to be depended on. Though easily inflamed into passion, and when under its influence abusive in the highest degree, they are, speaking generally, courteous, affable, and polite. They flatter with equal skill and profusion of compliments. Their language is extravagantly hyperbolic; and a stranger, ignorant of their character, would suppose them ready to devote their fortune and life to his service. A foreigner, therefore, on his first arrival, can hardly avoid receiving the most favourable impression of their friendly disposition. A longer acquaintance, however, proves that their flattery is nothing to their insincerity. However it may be accounted for, whether it be ascribed to the despotic nature of their government and the frequency of revolutions, the influence of their religion, or whatever cause, all travellers are agreed that the Persians have reduced dissimulation and falsehood to a system, and have practised them so long and so universally, that it would be difficult for them, even if they intended it, to speak the truth. Their whole conduct is a tissue of fraud and artifice; and they rarely think of fair dealing till they find they have to do with one who sees through their impostures. "There is no deceit, degradation, or crime to which they will not stoop for gain; and their habits of falsehood are so inveterate, that untruths flow, as it were, spontaneously from their tongue, even without any apparent motive." (*Fraser's Khorasan*, p. 174.) Mr. Kinneir's estimate of their character is, if possible, still more unfavourable. "They are," says he, "haughty to their inferiors, obsequious to their superiors, cruel, vindictive, treacherous and avaricious, without faith, friendship, gratitude, or honour." (*Memoir*, p. 22.) Presents, a necessary instrument of business over all the East, are expected in Persia with peculiar avidity. Without presents no inferior can approach a superior, or any individual ask a favour from another; and the donation, being supposed to confer honour, is made in the most public place and manner possible. They are said to be, with few exceptions, incorrigible spendthrifts: their dress, horses, harems, &c., are generally arranged on a scale exceeding their means, and intended for ostentation; and the difficulties in which they are thus involved

make them resort to any expedients, however mean and discreditable, for raising money.

These statements must, however, be understood as applying more particularly to the military pop. and especially to the habits of cities and towns. "The *Bedouins* have the virtues and vices of their condition, are generous, hospitable, and brave; but rude, violent, and rapacious. They are not in need of falsehood and deceit, and, therefore, not much in the habit of practicing them; but, if they have fewer vices than the citizens of Persia, it is evidently the absence of temptation, and the ignorance of luxury and refinement, which give them all the superiority they boast; for it is remarked that they never settle in towns, or make them as visitors, without exceeding the habits, in every species of profligacy." (Mackenzie.)

"The natives of Persia do not reside on camels, in the insubstantial manner of the Turks, but sit in an erect posture on thick felt, called a *carpet*. They have cushions, if ever free in their apartments, even in the coldest season, and, in order to be warm, fold themselves in a fur pelisse or a *barrow*, which is a handsome robe of crimson cloth, lined with shawls or velvet. Like other oriental nations, they rise with the sun; and having dressed and said their prayers, take a cup of coffee, or, perhaps, some fruit. They then enter upon the business of the day, if they have any, and, if not, amuse and converse until about 11 o'clock, at which time they have their breakfast, and then retire into their rooms until about 3 o'clock, when, to the hall, see company, and finish their day with those pursuits the most important and useful and transcended in public. Between 9 o'clock, or principal meal, is served up, consists of pilloves and of mutton and beef, in various ways, of which, however, they are sparing. When they ever take before company in private, they are the most voracious creatures, and invariably drink before they eat. They are passionately fond of tobacco, which they smoke almost incessantly from the moment they rise until it is time for them to retire to rest. A constitution, indeed, the principal source of amusement to a man of fortune; and were it not for his coffee, I am at a loss to imagine how he would spend his time. In this respect, indeed, there seems to be something peculiarly inconsistent in the character of the Persians. When without an inducement to exertion, he engages himself entirely to luxury and ease, and the same person who, with his scimitar in his mouth, would appear to pass the day in a state of stupor, when roused into action, and mounted on his horse, will ride for days and nights without intermission. Hunting and hawking as well as various gymnastic exercises, are favorite amusements of the Persians. By these means their bodies become hardened and active, and as they are taught to ride from their youth, they manage their horses with great boldness and address. They frequently use the warm bath, but seldom change their dress." (Kasner's *Persian Empire*, 244.)

The part of the friends, had an over, the where, moving their as quishing action:

by painting their faces, and sometimes also by tattooing their arms of various colours, while constant smoking spoils their teeth and mouths. Many of the women of Shiraz and other cities are as fair as those of Europe, but they wear, owing to their confinement, the blindest ornaments, in our estimation, to female loveliness. The Persians indeed would seem to be totally devoid of delicacy and refinement. Their language, says Mr. Scott Waring, "is often gross and disgusting, nor do they feel more hesitation in expressing themselves before men than they would before their female associates. Their terms of abuse and reproach are indelicate to the utmost degree. I will not dispute the reader by noticing any of them; but I may safely say, that it is not possible for language to express, or the imagination to conceive, more indecent or grosser images. When they leave the house, they put on a cloak which descends from their head to their feet and their faces are carefully veiled, holes only being left for the eyes. It is curious to see a number of tall and elegantly formed figures walking in the streets, and presenting nothing to your view but a pair of sparkling black eyes, which seem to enjoy the curiosity they excite. The veil appears to be essential to their virtue; for so long as they conceal their face, they care not how much they expose the rest of their person." Like the Mohammedans, the Persians are restricted to four legitimate wives, but they may have as many concubines as they please, the latter being acquired by purchase or

hire. Few, however, unless they belong to the sterner classes, indulge in the luxury of a plurality of wives, or keep concubines. Marriages are usually celebrated with great splendour, and often entail a ruinous expense on the parties.

Amount of Population.—There are no existing data on which to found any thing like an accurate estimate of the amount of the population. Finckherton supposed it might amount to about 10 millions, which Sir John Malcolm thinks may be a pretty close approximation to the truth. Another writer (Fraser) has set down the fixed population at about 7 millions, and the migratory population at from two to three millions, thus approaching in Finckherton's estimate. But besides the loss of territory which Persia has since suffered from her wars with Russia, a great depopulation has taken place within the last few years, from plague, famine, and various prevailing maladies, and there is reason, besides, to believe that this estimate of the migratory pop. was much beyond the mark, so that it is probable the pop. of the country subject to the shah does not exceed 8, and is certainly under 10 millions. We suppose from the *Fraser's Almanac* an estimate of the area and pop. of the different provinces, but it is needless to say that it is but little to be depended on.

Province.	Area in sq. m.	Pop.
Irak Ajam	99,370	5,500,000
Chaharmahal	1,500	120,000
Hamadan	7,500	500,000
Qazvin	10,000	500,000
Azerbaïjan	90,000	2,000,000
Khorasan	10,000	500,000
Kerman	90,000	500,000
Seistan	100,000	1,000,000
Kashan	10,000	500,000
Kerman	90,000	500,000
Hamadan	7,500	500,000
Chaharmahal	1,500	120,000
Total	600,120	11,420,000

The government of Persia, like that of most Eastern countries, is, in principle at least, an absolute despotism. The shah is regarded as the viceregent of the prophet, and, as such, is entitled to imperial obediency. His word is law; he is absolute master of the lives and properties of his subjects; and the first man in the empire may, at his command, be instantly stripped of all his dignities, banished, or strangled; the only control on his actions being the risk of provoking rebellion or assassination. The two principal ministers are the grand vizier, or *Vazir*, and the lord high-treasurer, or *Amir-e-Dowlat*. The former superintends every thing connected with foreign relations, and, in the absence of the sovereign, commands the armies; while the latter, who is subordinate to the other, superintends the internal arrangements, the collection of the revenues, &c. The whole executive government is in the hands of these two functionaries, whose authority, so long as they continue in power, is as absolute as that of their master; but their greatness, being built on the ruins of a tyrant, is of the most unstable kind, and they are very often precipitated from their slippery elevation.

The duties of a monarch, who either regards his own safety or the well being of his people, are numerous and weighty. One of the most important is the distribution of justice. The Mohammedan law both civil and criminal, is founded on the precepts of the Koran and the oral commentaries and sayings of the prophet's immediate successors. This is called the *Shariat*, or written law, and is the rule in all regular courts, where persons of the sacerdotal order such as Mullahs, preside. But there is also the *L'if* or customary law, administered by secular magistrates, having the king at their head. It is more arbitrary and the judgments of the king and his Mullahs are more summary, than those of the other court, and enforced with greater vigour. But there is an appeal to the superior functionaries, and the power of life and death rests with his majesty who seldom delegates it, except to princes of the blood royal or to governors of remote provinces. Theft is always punished with extreme severity.

The system of civil government is simple. Each province, or important district of a province, including some large city, has a *Baghlybeg* or governor, usually a prince of the blood or nobleman of rank who appoints his Mullahs, or *Mahdums*, over the districts and subdivisions; and each village has its *Kutubkhana*, or magistrate, generally one of the elders or more respectable inhabitants, who is the organ by which communication is kept up with government. There are also governors of cities and towns, *Daroghas*, or Mullahs of police, and *Kazis*, or chief magistrates of cities, in which each *mahallah*, or parish, has its *Kutubkhana*, or head, who are in general partially chosen by the people, and who look to the *Shah* as their head.

The *Baghlybegs*, like the Turkish pashas, are, at the expiration of a certain period, tried in court, where, admitting their conduct to have been over an irregularity,

able, persons are not wanting to accuse them of injustice and mal-administration; and unless the demands and avarice of the court be completely gratified, their eyes are put out, and their property confiscated! Conscious, therefore, of the necessity of amassing a sufficient sum of money to answer the rapacity of the king and his ministers, and aware, at the same time, that, provided the money be forthcoming, no inquiry will be made respecting the manner in which it has been acquired, the same mode is applied by the Beglerbegs to the Hakims and other subordinate authorities; who, in turn, oppress the heads of villages and the cultivators, so that the land becomes the prey of a subordination of vultures, and venality and extortion pervade every class from the throne to the cottage. (*Kinacir's Memoir*, p. 81.)

But, after all, the principal evil under which the country labours consists in the perpetual insurrections and the sudden changes of sovereigns and dynasties. The insecurity, devastation, and proscriptions, to which this state of things has led, have necessarily gone far to extinguish all industry, and many provinces that were formerly well peopled and well cultivated are now all but deserts. It has, also, prevented any idea of stability being associated with the existing state of things; and has made change, and the insecurity and falsehood inseparable from it, almost a necessary state of existence. Neither under existing circumstances does it seem reasonable to expect that any reform can be effected from within; and its subjugation by a European power would certainly be the most desirable event that could happen for the country.

The revenue of the Shah has been variously estimated, but does not probably amount to more than 1,500,000*l.* or 2,000,000*l.* As already stated, it is principally derived from taxes on land and farms, capitation taxes, duties on imports and exports, tributes paid by the nomadic tribes, &c.

Religion.—The Persians are Mohammedans of the sect called Schiites, or Sheahs, or of those who look upon Ali, the son-in-law of the prophet, as his legitimate successor. They repudiate the first three caliphs, Abubekr, Omar, and Othman, and their successors, as usurpers of the right of their patron Ali, holding that of his sons Hassan and Hussein to the caliphate as indefeasible, and acknowledging their 12 immediate descendants as the 12 high priests, or imâms, of their religion; the last of whom, Imaum Mehdee, they consider as still alive, though (*ghaib*) concealed for a time, so that no other can exercise the office. This doctrine is quite opposed to that of the Turks, who belong to the sect of Sunnites, and between whom and the Persians the most rancorous and irreconcilable animosity exists as to religious doctrines.

The priesthood consists of many orders, of which the Mooshtehed is now the chief. There are seldom above four or five of this dignity, and these are elected as much by the public voice as by that of their brother Mooshteheds, by whom they must be declared, for the Shah has no voice in their appointment. The Sheikh-ul-Islam, or ruler of the faith, is next in rank, but he receives his appointment and a salary from the Shah, and there is one in all large towns. In every mosque of consequence, and at every considerable shrine or place of pilgrimage, there are at least three regular ecclesiastical officers: the Mooturelle, who manages its temporal affairs; the Muezzin, or cregge to prayers; and the Mollah, who conducts the ceremonial. If the establishment be rich, there are several Mollahs, from among whom are selected a *peesh namâz*, who recites the prayers and goes through the motions and genuflections to guide the congregation. They also preach occasionally sermons from texts of the Koran. Of all these, except the Sheikh-ul-Islam, the income and means of life depends chiefly on the celebrity of the individual for wisdom, virtue, and religious sanctity; so that there are no means of estimating the income of individuals: but most mosques and shrines have large property in land and villages, the gift of the crown or of pious individuals, and out of this the priesthood attached respectively to each is maintained. Besides those above enumerated, there are in every city, and in every seminary of learning, a crowd of Moollahs who live by their wits, waiting for the chance of employment, but having little of the priest but the name. They practise astrology, write letters and contracts for those who cannot do it for themselves, and descend to all manner of meanness and vice for a livelihood.

The Persians, though there are many enthusiasts and bigots amongst them, are not generally intolerant: they listen without anger to the professions or arguments of those who hold a different belief, and do not allow this circumstance to cause any interruption of social intercourse. The only exception is in the case of the Guebres, or fire worshippers, who are probably rendered odious to the modern rulers of Persia by connecting with their faith an attachment to its ancient laws and political system. This unfortunate race is now almost entirely extirpated, only a small remnant being found in Yezd, and other cities of Kerman. Indifference, scepticism, and free-thinking, are, however, making a rapid progress.

This last, which may be identified with what is called Sooffeism, extends every day. There is, if we may so speak, a religious and a sceptical Sooffeism; the former is a sort of a mystical or fanatical aspiration after the mysteries of divine love, but without laying any or much stress on the rules and regulations of the Koran: the latter is of a bolder character, and approaches nearer to the European notions of free-thinking; its votaries affect no particular respect for religion, but are a species of metaphysical Deists, regarding the Koran merely as an elegant work, embodying sound moral doctrines, but not otherwise entitled to attention. Hence all who profess or are suspected of Sooffeism are hated or persecuted by the Moollahs. But Mohammedanism in Persia, as in other countries in which it is professed, appears decidedly on the decline, and Sooffeism is likely to be one great instrument of its overthrow.

The ancient religion of the Persians, which is not yet entirely extirpated, was materially reformed and renovated by the famous legislator Zoroaster, or Zerdusht. The life, and even the epoch of the birth, of this great reformer, are involved in the utmost obscurity; but the preferable opinion seems to be that he flourished about the 6th century B.C. He inculcated the doctrine of an eternal, self-existing, supreme Being, from whom every thing else has its origin; and from whom are sprung two antagonist powers, Ormuzd, the source of all good, and Ahriman, the source of all evil; of which, however, the former, though this point be extremely obscure, is destined, in the end, to obtain the ascendancy. The doctrines of original sin, the immortality of the soul, the happiness of the good and the misery of the bad in another life, are all laid down by Zoroaster. But the distinctive feature in the religion of the Persian sage is the extreme veneration paid to fire, light, and heat, which he regarded as symbolical of the Divinity. *C'est par lui que tout respire: la terre lui doit sa fécondité; l'animal, son existence; l'arbre, sa végétation. Non seulement il anime les êtres, il forme encore leurs rapports, et son action, par conséquent, n'est pas moins ancienne que le monde.* (Pastoret, Zoroaster, Confucius, &c., p. 30.) Herodotus says, that the ancient Persians neither erected temples nor statues to their gods, but sacrificed to them on the tops of mountains, or other high places. (*Herod.*, lib. i. cap. 131.) They had, also, the singular, and, as it appears to us, barbarous custom of exposing the bodies of the dead to be devoured by birds, (*Herod.*, lib. i., cap. 140.); and Niebuhr distinctly states that this custom was observed in his time by the Parsees at Bombay. (*Voyage en Arabie*, ii. 39.) The magi, or priests, established by the Persians, had great influence.

Education.—In former reigns, particularly in the time of the Saffaveans, when literature was more encouraged than now, considerable attention was paid to education. Medressas or colleges were built and endowed, in which moollahs and teachers of suitable abilities were placed to instruct the students. These buildings consisted of a quadrangle, the interior sides of which were pierced with small cell-like apartments, like those of a caravanserai, in each of which a student lived. But these institutions were rather for students of more advanced age; for younger pupils of the lower classes there are schools kept by private persons, where reading and writing are taught, and some knowledge of the practice of religion is imparted, with perhaps, to some who are destined to become "men of the pen," a little superficial instruction in logic and grammar. The children of the higher orders are taught at home by *meallims* and *lâllaks*, or tutors, who, after the elements of Arabic and Persian are acquired, instruct their pupils in the duties of their religion, and teach them to read the Koran, with such works as are calculated to impress them with a strong regard for Sunnite doctrines. Next come the works of Saadi and Hafiz, with a superficial course of grammar, logic, and philosophy. All this time athletic exercises, riding, hunting, and the use of arms, are not neglected; and from the earliest age every boy is carefully schooled in all that regards the ceremonial of social intercourse. He is taught how to sit down and rise up, and to stand in the presence of his elders or superiors; and so much stress is laid on these matters, that it is most uncommon to observe the least deviation from due etiquette even in children of 5 or 6 years of age. But the whole system is artificial, more showy than solid, and tends in no small degree to nurse up the rising generations in that disposition to deception and hypocrisy which marks so strongly the national character.

Military Force and Resources.—"Frugal in his diet, robust in his constitution, capable of enduring astonishing fatigue, and inured, from his infancy, to the extremes of heat and cold, to hunger and thirst, nature seems to

* The *Zend-Avesta*, the most important work on the religion of the Parsees, was translated and published in 3 vols. 4to. by Anquetil du Perron in 1771; but it is believed by some of the ablest critics that the most ancient portion of this work is long posterior to the age of Zoroaster.

have formed the Persian for a soldier. But as, according to the ancient customs of this people, it is deemed degrading to a person, who has money sufficient to purchase a horse, to travel on foot, the infantry of Persia has been, from the earliest ages, contemptible; whilst her numerous bodies of irregular cavalry have more than once carried terror and defeat amidst the disciplined legions of Rome." (*Kinacir's Memoir.*) Her forces, however, both cavalry and foot, have varied in amount and efficiency with the varying abilities and martial skill and daring of the different monarchs. Until lately that attempts have been made to form regular corps, disciplined after the European fashion, the army has mostly consisted of levies of irregular cavalry, furnished by the chiefs of the different wandering tribes, according to their presumed numbers and strength, and also by the different cities and towns, on a plan corresponding in many respects with the feudal levies of the middle ages in European countries. The troops thus collected, though brave, are totally deficient in organisation and discipline, and could make no serious impression on a body of European troops. Inasmuch, too, as the arms and horses on which the horsemen are mounted do not belong to the state, but to the individuals, and frequently constitute their whole property, they are very apt to prefer their safety to other considerations; a circumstance which, on more than one occasion, has proved fatal to the reputation of the Persian army. The whole force that might thus be collected on an emergency might, perhaps, amount to 100,000 or 150,000 men. In the late reign, the first attempt was made to introduce European discipline and tactics among the Persian soldiers. The Prince Royal, Abbas Mirza, obtained leave from his father and officers from the E. I. Company to raise and discipline a body of troops in Azerbaijan, with a view of opposing the Russians, and strengthening his internal government; and he did form a corps amounting, with cavalry and artillery, to about 12,000 men. Of these the horse artillery were particularly good and efficient; but after the peace of Goolistan with Russia, the men composing this corps were unwisely permitted to return to their homes, mustering only occasionally; the officers remaining useless appendages of state at the court of the prince. On the commencement of the war with Turkey in 1822, as British officers could not serve against a power on friendly terms with Great Britain, they were dismissed; but the army of 35,000 men, regular and irregular, with which the prince marched against the Turks, was victorious, until dispersed by the cholera; and from that time until 1833-34 there were only one or two British officers retained to drill and to command the *serbâz*, or regular troops, which were still maintained in Azerbaijan. When the Prince Royal, however, proposed to subdue the rebellious chiefs of Khorasan, and to reduce some of the other more remote provinces to order, he felt the want of more efficient aid to reorganise his military force, and applied to the British government of India for a supply of commissioned and non-commissioned officers, who only reached Persia after his death, in 1833. His son, Mahomed Mirza, the present Shah, has pursued his father's plans, but with less ability and consistency, for though desirous to increase and improve his army, he has never employed these officers in the way to render their services most useful.

In the late disastrous campaigns in Khorasan, and particularly against Herât, the army suffered much from sickness, casualties, and desertion; so that no calculation can be made of its actual state. In 1837, however, when the Shah made every possible effort to bring a large force against Herât, the besieging army did not certainly exceed 35,000 men of every description. The falling off in the amount of the army from the Russian war of 1827-28, is very striking; for the Prince Royal had then a well-appointed army of 40,000 men, with all its complement of baggage, cattle, and attendants on the frontiers; while the Shah was at Choes with another army of 80,000. It may be doubted, however, whether the attempts to introduce European tactics and discipline into such a country, and under such a government as that of Persia, can ever succeed; and whether it would not have been better policy to trust now, as of old, mainly to levies of cavalry, and endeavouring to improve and amend the defects in their constitution and discipline. What may be called the household troops of Persia, consist of kind of militia of about 10,000, quartered in the capital and its vicinity, and liable to be called out at a moment's warning. The *gholams*, royal slaves, or body guard, have been already noticed.

Arts, Language, Sciences, and Literature.—Of Persian proficiency in these, previously to the Mohammedan conquest, little or nothing is known, all that may have existed having been destroyed by the Moslems. But we may infer, from the relics of sculpture of the Sassanian era that remain, and from accounts of contemporary authors of other countries, that some of the arts, at least, were then successfully cultivated. In the days of the Saffavians, painting appears to have received some attention, and archi-

tecture still more; but though attempts at depicting the human form, as well as animals and landscapes, are numerous among the Persians of this day, they are but rude and unsuccessful, the total absence of all drawing and perspective rendering their performances ludicrous, if not disgusting. In fact, being quite without models for either painting or sculpture to copy from, excellence is scarcely to be looked for, especially in a country where the tyrannical spirit of the government and nobility would render such attainments dangerous rather than profitable to the owner. Their most successful performances are the inkstands and small boxes, made chiefly at Shirâs and Ispahân, which are ornamented with figures of boys and girls, birds and flowers, finished with surprising minuteness and accuracy. The stone and seal cutters of the same cities are also famous for their workmanship.

When the Arabs overran Persia, about the middle of the 7th century, three languages were spoken in the country, the Parsee, Pehivi, and Deri, exclusive of the Zend, or language dedicated to religion. The first of these languages has superseded the rest, which are now only known by name, and become the universal language of the country. It is of simple structure; and, like the English or French, has few or no inflections, prepositions governing its cases, and auxiliary verbs its tenses and modes. Many of its roots can be readily traced to the Sanscrit; and, in the course of time, it has received a large accession of Arabic words. All the existing literature of the Persians dates from the Arabic conquest, and mostly, indeed, belongs to the 15th and 16th centuries.

In science the Persians are scarcely more advanced than in art. Astronomy, judicial astrology, metaphysics, logic, mathematics, and physic, are among those professedly cultivated. But their efforts in the first are contemptible; their theories, founded on the Ptolemaic system mixed up with fantastic notions of their own, are utterly useless, unless to aid their dreams of astrology. Their firm belief in this science is universal, and no Persian will undertake the most trivial affair without consulting some professor of its mysteries for a lucky hour. Their metaphysics and logic are scarcely less puerile. The first consists of little more than a collection of disputations, sophisms turning on wild and unprofitable paradoxes; the second is an ingenious method of playing upon words, the object being not so much to arrive at truth, as to display quickness of mind and readiness of reply, in the discussion of plausible hypotheses. Geography is no better understood. Their knowledge of countries, and their relative positions, is extremely confused; nor can they describe, with any exactness, even those places or regions with which they are most familiar.

Mathematics, though not much more beneficially applied, are taught upon better principles, for the Persians are acquainted with the works of Euclid. Chemistry is unknown; but alchymy is a favourite study, and the search after the philosopher's stone continues to be eagerly prosecuted. In medicine, though they profess themselves pupils of Galen and Hippocrates (*Intenooos and Bocrat*), they practise only the most wretched empiricism, united with the exhibition of a few simples, the qualities of which experience has taught them. Diseases are classed into hot and cold, moist and dry, upon no apparent principle, and each disease is combated by a remedy supposed, as vaguely, to be of an opposite quality. They are quite ignorant of anatomy, and even of the circulation of the blood, so that their knowledge of surgery is no greater than that of medicine. Yet, though they admire the skill of Europeans, and eagerly possess themselves of their remedies, they adhere obstinately to their own practice; and all the persuasion of the British mission, and its medical men, were for ten years exerted in vain to introduce vaccination, although the ravages of the smallpox were frequently dreadful. The profits of science are confined to those who are regarded as proficient in divinity, astrology, and physic. The two former, when combined, thrive best.

The Persians make high, and, in a few respects, not ill-founded, pretensions to literature. Their treatises on the sciences now mentioned are in a great measure borrowed from the Arabians; and little improvement has been made of late in these branches. Their historical works are of a higher cast, and include some of considerable merit; but these belong chiefly to the earlier and brighter times of the empire. Among the more modern may be noticed a History of Nadir Shah, a flowery but authentic record of the life of that extraordinary monarch. But it is in poetry the Persians claim peculiar excellence; and they, no doubt, can produce the names of more eminent authors in this department than any nation of the East. From the highest to the lowest, they possess an exquisite relish for poetical compositions: from the men of letters to the lowest groom they recite passages from their heroic poets, or chant odes of Hafiz; and if you find fault with a tent pitcher, he probably replies with a stanza from Rudiki, or a moral

apothegm from Saadi. It is singular, however, that the moral lessons inculcated by their poets and learned, and, as it should seem, admired by the people, should be wholly inoperative in practice; the Persians being certainly as corrupt, sensual, and immoral, as any people of Asia.

Their poetry may be divided into epic and narrative, moral and lyric. Of the first class Ferdousi is the father, though Dukeekoo did compose about 1000 verses of the *Shahnameh*, in which the former is also said to have been assisted by Asidi. Next to Ferdousi ranks Nizami, who composed a poetic life of Alexander the Great; but this, like the Yuseeff and Zuleika of Jami, another on the same subject by Ferdousi; the *Laila* and *Mignoon* of Hatife; *Khoosroo*, *Shireeu*, and others, recited with rapture all over Persia, are, in fact, poetic romances, called *Musnavees*.

Of the didactic poets the chief, without question, is Saadi, whose *Goolistan* and *Bostan* abound in beautiful maxims and fine moral precepts. Sheikh Saadi was born at Sheraz (A. D. 1194), and in his youth was a great traveller. While in Syria he was taken by the Crusaders, and actually compelled to labour as a slave at the fortifications of Tripoli. From this condition he was relieved by a merchant of Aleppo, who not only paid ten crowns for his ransom, but gave him his daughter with 100 for her dowry. The lady, however, proved a shrew, and Saadi, in several parts of his works, gives vent to the chagrin caused by this marriage. Among other taunts she is said to have reproached him with having been bought from the Christians by her father for ten crowns: "Yes," replied the unhappy moralist with a sigh, "and he sold me to you for an hundred." He died in his native city at the extreme age of 120 lunar, or 116 solar years; and his tomb is still to be seen near the place of his birth,—a small mosque-like edifice, within an enclosure, in which are some fine old fir trees and some cypresses.

In the mystic and lyrical strain there is none who can come into competition with Hafiz, to whom also Shiraz had the honour of giving birth. He flourished in the time of Tamerlane or Timour Bec, who, when he came after the defeat of Shah Mansora to the place where the poet dwelt, desired to see and converse with him. With feigned or real displeasure, the conqueror demanded to know how he dared to dispose of his two noble cities of Samarcand and Bokhara, which, in a beautiful stanza*, he declared he would give for a mole on the cheek of his mistress: "Can the gifts of Hafiz ever impoverish Timour?" was the reply, which changed the monarch's wrath into admiration, and elicited reward instead of punishment. The poetry of Hafiz is considered by Persian scholars as of a singularly original character—simple and unaffected, yet possessing a wild and peculiar sublimity. Like most lyrical effusions, his odes will not brook translation, so that his beauties can never be comprehended by the mere English reader. In his own country, however, he is fully appreciated; and perhaps no poet of any country ever attained greater popularity among those for whom he wrote than the *khanjeh* of Shiraz. His mortal remains rest near the city whose praises he has celebrated, not far from the tomb of Saadi, and near his favourite stream of *Roknabad*. The tomb is in a small enclosure, whither the people of the place resort to sit under the shade of the old cypresses, recite the odes of their favourite bard, and draw omens from the pages of his works.

Next to Hafiz, in celebrity, has been placed Abdul Rahman Janie, a famous doctor of laws, and no less famous sooffee, whose *Diran*, or collection of odes, is in high estimation with the enthusiasts of his sect. His wit is said to have been equal to his poetic genius.

To these already mentioned, might be added many names scarcely less celebrated, whose works it would require too much space to particularise or describe. But it is not to be imagined that their perusal would give any pleasure to European readers. They contain, it is true, many beautiful thoughts, and their diction is frequently euphonious and expressive; but they have the vice of most Eastern works, that is, of being disfigured by the wildest extravagance and bombast, and by an endless repetition of metaphors and similes.

History.—Modern Persia comprises the countries known in antiquity by the names of *Media*, *Susiana*, *Caramania*, *Hyrkania*, and Persia Proper. Its ancient history is intimately connected with that of Greece and Rome. In more modern times it has been the theatre of endless civil wars, revolutions, and changes devoid of all interest to foreigners. Towards the end of the 16th century, however, order was restored, and Persia rose to distinction under the government of Shah Abbas, surnamed the Great, who defeated the Turks in several battles, taking from them the city of Taurus and the province of Georgia, and Ormuz from the Portuguese. Abbas was succeeded by a series of imbecile tyrants; and, in 1727, the country was overrun by the Afghans.

* Beautifully, though freely, translated by Sir William Jones.

At length the famous Thamas Kouli Khan, a brigand chief, was raised to the throne by the title of Nadir Shah, and distinguished himself alike by his victories and his ferocity. Nadir being assassinated, in 1743, his death was followed by a long-continued civil war. After a vast deal of blood had been spilt, the eunuch Mehemet Khan, succeeded, by his superior ability and good fortune, in establishing his authority over most of the provinces now comprised in Persia; and transmitted his authority to his nephew Futteh Ali Shah.

This prince waged an unsuccessful war with Russia, who stript him of a large territory in Armenia, and obliged him to pay 2,500,000*l.* as an indemnity for the expenses she had been put to in the contest! Futteh Ali kept an enormous harem; and it was his practice to disperse his sons over the empire, as governors of provinces, towns, &c., of which, speaking generally, they were the scourges. On the death of Futteh, in 1835, his grandson, the present sovereign, son of the prince royal, Abbas Mirza, succeeded to the throne in terms of his grandfather's will. A few of his uncles, who were reckoned most dangerous, were deprived of sight; but on the whole the succession was unusually tranquil and bloodless. This sovereign is understood to be favourable to the interests of Russia, or rather, perhaps, he thinks it most prudent to keep on good terms with those who have the greatest means of injuring him. His unsuccessful expedition against Herat is said to have been undertaken at the instigation of Russia.

PERSIAN GULPH, an extensive arm of the Indian Ocean, separating Persia from Arabia, between the 24th and 30th degs. N. lat., and the 47th and 57th E. long., uniting with the Indian Ocean by the strait, about 32 m. across, between Cape Musseldom (lat. 26° 19' N., long. 56° 30' E.), and the opposite coast. This gulph has somewhat of an oval shape, extending about 550 m. N.W. and S.E. with an average breadth of about 160 m.; but towards its S.E. end it is upwards of 220 m. in width, though it soon afterwards, on taking its northern bend, previously to its junction with the ocean, becomes much narrower. It receives at its N.W. end the united waters of the Euphrates and Tigris, about 70 m. below Bussorah; but it has few or no other affluents of any importance. These streams, however, assisted in some measure also by the shape of the gulph itself, tend to diminish the height of the tides, which is considerably less than in the Red Sea. (*Traill's Phys. Geog.*, p. 116.) The climate round the shores of this gulph is extremely hot; and notwithstanding the prevalence of N.W. winds, the thermometer in some parts stands at a higher elevation than in almost any other locality with which we are acquainted. Owing to the number of small islands, and the number and extent of its reefs, the navigation of this sea, especially along the coast of Arabia, is hazardous, difficult and tedious: it is less encumbered along the Persian coast. The trade carried on in the ports, on or connected with the gulph, is very considerable. Bussorah is the principal inlet through which Indian and other eastern products find their way into the Turkish empire; and Bushire, in the Persian territory, is the chief entrepôt of the trade between that country and Bombay, whence it receives the products of Europe, China, and the E. Archipelago. The chief interest, however, that attaches to the Persian Gulph, is its pearl fishery, on which indeed the inhab. of the S. coast mainly depend, as the land produces only a few dates, and is insufficient to support the pop. (For details as to these fisheries, see the article **BAHRAIN ISLANDS**; and see also **BUSSORAH** and **BUSHIRE**, in this Dict.) This sea was surveyed between 1821 and 1828; but, although much information has come to us through charts and memoirs in the *Geog. Journal* (vols. v. and viii.), we are far from possessing any satisfactory information respecting its islands, which are, in all probability, more numerous and important than has hitherto been supposed. The ancient importance of the Persian Gulph is principally owing to its connection with the conquests of Alexander, and its commercial intercourse with India. Were the scheme for the steam navigation of the Euphrates to succeed, this sea might again become, as it was during a certain period of antiquity, a thoroughfare for the commerce between the E. and W. worlds; but the advantages in this respect enjoyed by the route by the Red Sea and through Egypt, are so very superior, that we have no doubt it will continue to engross by far the larger portion of the trade not carried on by the Cape of Good Hope. The islands and shores of the Red Sea have been at all times a favourite resort of pirates. At present, however, they are, in consequence of the exertions of the British government, nearly extirpated.

PERTH, one of the largest and most important cos. of Scotland, nearly in the centre of that part of the U. Kingdom, but communicating by the Frith of Tay with the German Ocean, having N. the cos. of Inverness and Aberdeen, E. Forfar, S. Fife (from which it is mostly separated by the Frith of Tay), Kinross, Clackmannan, the Frith of Forth, and Stirling, and W. Dumbarton and Argyle. Exclusive of a small detached portion on

the Frith of Forth, it is of a compact circ. Area 1,834,330 acres, of which 32,000 are water. It comprises within itself almost all that is so characteristic of Scotland; having every surface and soil, from rugged, sterile mountain, level, fertile vales. Its lakes and rivers are grand and varied scale; and its climate is as its surface, being severe in the more elevated and early in the lower districts. The contrast in habits is equally great; the Celt being for mountains and the Saxon on the plains, and lag widely from the other in language, dress, &c. Perth is naturally divided into highland lands; all the country, including the Ochil hills, from its S. frontier to the foot of the Grampian range, being included in the lowlands, and the remainder highlands. The part of the Grampian chain comprises some of the highest mountains in Scotland, among which may be specified, Ben Lawers, 3,944; Ben Glac, 3,800; Schichallion, 3,079, and Ben Ledi, 2,868 ft. above the sea. Besides the mountains and hills there are very extensive, though progressively decreasing, tracts of moor, moss, and bog. There is a large extent of natural wood and plantations, the latter were much extended by the operations of the Duke of Atholl, who planted above 16,000 acres notwithstanding these deductions, the cultivated area is estimated at from 530,000 to 660,000 acres, or about one-third part of the entire surface. The most fertile tract of low land is denominated the Carse, being the district bounded by the Tay on the S. the Sidlaw hills on the N., and Forfarshire on the E. Its soil is mostly a deep rich clay loam; and, for fertility, it is not, perhaps, surpassed by any other in the kingdom. The lower part of Strathern, from the confluence of the Earn and Tay to the Forth, is a similar soil, and is hardly less fertile. In these, and the low lands along the Tay, as there are in the valleys of the Teith, Forth, &c. extensive tracts of carse land, and gravelly loam. Light gravelly soil is, indeed, prevalent in Perthshire. There are some estates, but there is, also, a fair proportion of smaller class of proprietors. Arable farms vary from 50 to 600 acres. The same plan of husbandry prevailed in Argyle (which see) of holdings common, prevailed throughout the highland shire; but examples of it are, at present, the latter than in the former. Farms in the lowlands are universally let on lease, for nineteen years; large stock farms are also let for some of the small highland occupiers year to year. Buildings and other accoutrements of the farmers, in the lower districts, are for the most part substantial and excellent; but in some of the highland districts they are still, in many instances, deficient. Wheat and beans, of excellent quality, are the principal articles of cultivation in the Carse, Strathern, parts of Strathmore, the valley of the Forth, and Teith, &c. In the midland districts, but the higher, oats, are the principal crops. Potatoes are cultivated, largely consumed, and exported in large quantities to the London market, and are extensively prosecuted. Considerable quantities of fruit, as apples, pears, &c., are produced, particularly in Gowrie. Breeds of cattle are none peculiar to the country; the stock differs in quality of the land on which it is pastured, and the number of sheep vastly increased within the last few years, and the Cheviot breed now generally diffused. It is to be generally understood that the land is under a constant system of cropping without rest. The sheep husbandry is, therefore, of the ground; and the breed of cattle has been improved in size and earliness of maturity." (*New Stat. of Scotland, Perthshire*, p.196.) Roads signally improved, as much so, certainly, as in any other Scotch county, and found in the S. part of the co. contiguous to the Forth, and limestone and freestone are generally diffused. Average rent of land, in 1841, was 18s. The linen and cotton manufacture has increased, particularly into the city of Perth; and has had much success; so that, on the whole, it may be regarded as an essentially agricultural county, and we are glad to say that the progress of improvement during the present century has been most rapid. The following statements by the author of the *par. of Western Fowls* in the *New Stat. of Scotland*, are generally applicable to the county. "Since the date of the last statistical account improvements have been made in rural economy, and ground has been planted and brought into cultivation. The roads are in a superior condition, and have been constructed. Farm steadings covered with thatch, and indifferent in bulk and accommodation; but they are now all slated,

any town of a similar size in Scotland, perhaps in the empire. This branch has now, however, materially declined.

Poor rates have been introduced into the town, the assessment being, for the year ending 1st July, 1850, 5,740*l.* 16*s.* 3*d.*, in addition to the church collections, which average about 700*l.* The number of paupers in 1850 exceeded 800. The incorporated trades, in addition to this, give an annual allowance of above 2,000*l.* to their poor members, whose number is generally about 200. A hospital for behoof of the poor was founded by James VI. This institution has a revenue of about 750*l.*, distributed among 63 out-pensioners, the building being let. There are two dispensaries and an infirmary, in addition to the lunatic asylum above noticed.

About 60 years ago, Perth had an extensive trade in gloves; those made here having a preference throughout the kingdom. Latterly, however, Dundee has quite superseded Perth in this department. In consequence, the business of tanning, which principally depended on the glove trade, has greatly declined. The manufactures consist at present principally of coloured cottons, especially for umbrellas. A great quantity of handkerchiefs, checked and striped gingham, imitation India shawls, scarfs, trimmings, &c., are also woven. The aggregate number of weavers is about 1,600, some of whom are employed by Glasgow and Paisley houses. There were some years ago 4 flax-spinning mills; but of these 2 are now being converted into power-loom factories, and one into granaries. A large bleach-field at Tulloch, 2 m. W. of the city, employs 250 individuals. There are in the town several breweries, corn-mills, and 2 considerable iron-foundries. The working classes are, speaking generally, well employed at fair wages; and for these two years past they have, owing to the low price of provisions, been comparatively prosperous. The salmon fisheries on the Tay, belonging to the city, bring a rent of 1,200*l.* per annum. The quantity of salmon, inc. grilse, shipped and sent by rail from Perth for London, amounts, at an average, to about 4,500 boxes, or 225 tons a year.

The Tay is navigable, at high water, to Perth for vessels drawing 14 ft. water; but the navigation was formerly much obstructed, and a great deal was required to be done for its improvement. In this view an act was obtained in 1834 for deepening the bed of the river, and forming a new harbour and wet dock, and great part of the works have been executed with much advantage to the navigation. There belonged to the port on the 1st January, 1850, 85 vessels of the agg. burden of 8,104 tons, and about 800 coasting-vessels annually enter the port. The exports consist chiefly of manufactured goods, corn, salmon, and potatoes, large quantities of the latter being shipped for London. The town supports 2 native banks and 4 branch banks: it has also a savings' bank, established in 1838, which, on the 30th January, 1849, had 107,354*l.* deposits, 2 weekly markets and 5 annual fairs. Gross customs revenue, 1849, 17,041*l.* Perth is a principal centre of railway travelling, being directly connected with Dundee, Cupar Angus, and Aberdeen; with Stirling and Glasgow; and with Burntisland and Edinburgh.

Perth is very ancient; and some authorities refer its origin to the Romans. It was a bor. at least as early as 1106. Its church being consecrated to John the Baptist, it was long called St. Johnstoun. Prior to the reign of James II., Perth was the capital of Scotland; and from its central situation it is, perhaps, to be regretted that it did not continue to enjoy that distinction. The kings were crowned at Scone, about 2 m. N. of the city, and had a residence in the town. The "Parliament House" of Perth remained standing till 1818, when it was pulled down. Scone Palace, long a royal residence, has been rebuilt by its noble owner, Earl Mansfield, and is now a splendid modern mansion. The famous stone, reckoned the palladium of Scotland, on which the Scottish kings were crowned, was transferred from Dunstaffnage, in the 9th century, to Scone, whence it was removed by Edward I., in 1296, to Westminster Abbey; since which it has been enclosed within the frame-work of the regal chair on which the British sovereigns have been crowned since Edward II. There were no fewer than four monasteries in Perth (ex. one in Scone), two nunneries, and eight chapels. But the violence of the Presbyterians at the Reformation may be said not to have left a relic of these buildings. Here, in 1437, James I. was assassinated in the Blackfriars' Monastery. And here, in August, 1600, Gowrie house was the scene of that most mysterious incident in the history of Scotland, entitled the *Gowrie conspiracy*; of which, if not the contrivers, Earl Gowrie and his brother were, at all events, the victims. The house was pulled down about 30 years since, to make room for the county buildings, which occupy its site. Perth is associated with many other important events in Scottish history; but we limit ourselves to mentioning that, in 1644, it was taken by Montrose, after his victory at Tippermuir, in the neighbourhood; in 1651 it capitulated to Cromwell; and it was occupied by the insurgents in the rebellions of 1715 and 1745.

At Ruthven Castle, now called Huntingtower, 2 m. W. Perth, took place, in 1582, the singular occurrence in the history of James VI., called the *Raid of Ruthven*.

Before the passing of the Reform Act, Perth was united with four other bors. in sending 1 mem. to the H. of C.; but that Act conferred on it the important privilege of returning a representative for itself. Registered voters in 1849-50, 1,039. Perth is an opulent bor.; the corporation revenue for 1848-49 amounted to 5,273*l.*

Perth, though it never was the see of a bishop, is called a city; and, in the rolls of the Scottish parliament, it held rank next to Edinburgh. Its chief magistrate has the title of Lord Provost. It has, also, a Dean of Guild, ranking next to the Lord Provost, as a councillor, but not as a magistrate; 4 bailies, a treasurer, and 19 other ordinary members of council.

The situation of Perth is one of the finest in Scotland. Close to the city, on the E., is the hill of Kinnoull; the summit of which, of easy access, commands one of the noblest prospects that is anywhere to be met with. Towards the S. and E. is the valley of the Tay, and the confluence of the Tay and Earn; to the W. is a finely variegated country, and to the N. the prospect is bounded by the stony girdle of the Grampians. The country round Perth is amongst the most fertile in Scotland.

PERU, a celebrated country of S. America, formerly one of the most valuable possessions of the Spanish crown. It then included the modern republic of Bolivia (S. or Upper Peru); but at present the term is restricted to the republic of N. or Lower Peru, lying chiefly between lat. 3° and 21° S., and long. 65° and 81° W.; having N. the Columbian republic of Ecuador, E. Brazil, S. E. and S. Bolivia, and W. the Pacific. Extreme length, S.S.E. to N.N.W. about 1,500 m.; breadth varying from 40 to 600 m. The area is estimated at about 500,000 sq. m. It is divided into 10 provs.; and is supposed to have from 1,500,000 to 1,700,000 inhabs.

Physical Geography, &c.—The country is naturally divided into 3 regions; that between the coast and the Andes; that occupied by the latter; and the region E. of the Andes, forming a part of the basin of the Amazon. All these divisions differ widely in their physical character. The coast region from Tumbes, on the N. frontier to the river Leche, is mostly a desert; and wherever, in fact, the coast region is not traversed by streams, or is unsuceptible of irrigation, it consists principally of arid sandy wastes, and is in the last degree barren. The Andes and their ramifications have been roughly estimated to cover, in Peru, an extent of 200,000 sq. m. They consist here, as in Bolivia, of two main chains, or Cordilleras, connected in various parts by cross ranges, and inclosing several extensive and lofty valleys. Round Cuzco is a vast knot of mountains, occupying about three times the extent of Switzerland; and round Pasco, in lat. 13° S., is another knot surrounding the plain of Bombon, 13,500 ft. above the sea level, and in which are the rich silver mines of Cerro Pasco. The Peruvian Andes are not in general so elevated as the Bolivian; though many of their peaks rise far above the limits of perpetual snow. The loftiest summits are towards the S., where the Nevado de Chuquibambá (about lat. 15°) reaches to 21,000 ft. in height; and several other mountains surrounding the valley of Desaguadero, which belongs partly to Peru (see BOLIVIA, l. 401.) may at least approach this elevation.

In Bolivia the E., but in Peru the W., Cordillera is the highest. At the mountain-knot of Pasco, the Andes separate into 3 collateral chains, which, proceeding N., separate the basins of the Marañon, Huallaga, and Ucayale. The last range of the Andes to the E., in Peru, extends between the 6th and 15th parallels of lat., at a distance varying between 200 and 400 m. from the Pacific, and separates the basin of the Ucayale from those of the Yavari, Beni, and other affluents of the Amazon. Probably no part of this range rises above 10,000 ft. in height. (See ANDES, Vol. I.)

The space enclosed between the gigantic ridges of the E. and W. Cordillera, called the Sierra, is partly occupied by mountains and naked rocks, partly by table-lands yielding short fine grass, and extensive hilly pasture ground, very like, in general outline, to the Highlands of Scotland, though destitute of heath, and partly by extensive and fertile valleys, that once supported a much larger amount of population. The third region, or country E. of the Cordilleras, is very little known: it is mostly covered by all but interminable forests; and a large portion of it can scarcely be said to belong to Peru, since only a few R. Cath. missions are here and there scattered over its surface, the rest of the country being in the exclusive possession of the native Indians.

Peru gives birth to some of the largest rivers in the world. The Tunguragua, generally regarded as the proper source of the Marañon or Amazon, and its vast confluents the Huallaga and Ucayale (the latter formed by the junction of the Apurimac and Paro), have their sources on the E. side of the W. Cordillera, between 10½ and 16° S. lat.; and pur-

sea, though with many windings, a northerly course till they leave the country. These great rivers are mostly navigable; and, with the assistance of steam-navigation, will no doubt, at some future period, carry the riches of this remote region across the continent to the ports on the Atlantic. The great lake of Titicaca (which see) is mostly in Peru; but, excepting it, there is no other large lake: there are, however, some smaller lakes, one of which, the lake of Llauricocha, to the N. of the Cerro do Pasco, gives birth to the Tunguragua. (*Geog. Journ.*, v. vi. viii.; *Poeppig. Reise in Peru*, &c., ii.; *Meyen, Reise um die Erde*, &c., *passim*.)

The coast is throughout rugged and lofty. In the N. provs., some miles of a loose sandy desert intervene in a few places between the high lands and the ocean; but in general, the cliffs approach close to the shore, which has not, perhaps, in an extent of 1,600 m. a dozen secure harbours. The best are those of Callao, Payta, Sechura, Salina, Pisco, Islay, Iquique, and a few others. Truxillo and Lambayeque have only open roadsteads. The water being almost uniformly deep, vessels are obliged to approach within $\frac{1}{2}$ m. of the shore, before they can anchor; and the prodigious swell which rolls in unbroken from the Pacific occasions a heavy and dangerous surf. The operation of landing is, except in a few places, at once difficult and hazardous; it is effected by means of *balsas*, or platforms raised on inflated skins, and differing in shape in different parts of the coast. The *balsa* used by Captain Hall off Mollendo, was "made of 2 entire seal skins inflated, placed side by side, and connected by cross pieces of wood, and strong lashings of thongs; over all a platform of cane mats forms a sort of deck, about 4 ft. in width, and 6 or 8 ft. in length. At one end, the person who manages the *balsa* kneels down, and by means of a double-bladed paddle, which he holds by the middle, and strikes alternately on each side, moves it swiftly along; the passengers, or goods, being placed on the platform behind him. All the goods which go to the interior, at this part of the coast, are landed in this manner. The great bars of silver, and the bags of dollars, also, which are shipped in return for the merchandize landed pass through the surf, on these tender, though secure conveyances." (*Hall's S. America*, i. 205, 206.)

Climate.—The year may be divided into 2 seasons; the wet and the dry. From June to October, the coast lands in all the S. and central provs. are covered during the night and morning with a dense fog, the only moisture supplied by nature to this part of the country. These fogs diminish as we proceed N., and in the N. prov. of Piura, which is celebrated for its dry atmosphere, rains occasionally occur; and when such is the case, the *arenales*, or arid sands, are speedily clothed with the most exuberant vegetation. While, however, the dry season prevails on the coast, and especially from Jan. to March, heavy rains fall in the mountains, frequently accompanied with thunder, which never occurs along the coast. The extensive valleys between the Cordilleras, such as that of Cusco, 10,000 ft. above the level of the sea, enjoy an admirable climate; and though between the Tropics have, in consequence of their elevation, all the advantages of the best climates of the temperate zone, with but few of their disadvantages. Beyond this, and at the level of about 14,000 ft., commences the limit of perpetual snow. Even in the coast region the temperature is not so high as might be supposed from the latitude; cooling S. winds being uniformly prevalent, and the sea-breezes by day alternating with others blowing from the land at night. The mean temp. of the year in Lima is about 70° Fahr. Wheat, and other European *cerulias*, though but little cultivated, succeed admirably in the elevated valleys of the Sierra; potatoes thrive best at an elevation of from 11,000 to 15,000 feet. The country is, on the whole, salubrious. Cholera, bilious and inflammatory diseases, small-pox, and hydrophobia are common; but in Lima, and many other parts of the country, individuals frequently live to an advanced age.

Peru is more subject, perhaps, than any other country, to the tremendous visitation of earthquakes. Shocks are felt every year; and they occasionally become so violent, as to be productive of the most disastrous consequences. The earthquake which occurred in 1746 swallowed up the entire sea-port town of Callao, and destroyed the greater part of the city of Lima. The years 1687, 1806, and 1828, were, also, distinguished by the occurrence of severe and most destructive shocks.

Minerals and mines.—Peru, like Mexico, is famous for her mineral products; and we have been long accustomed to associate her name with the almost unlimited abundance of gold and silver. But, though the most exaggerated notions of the value and importance of the Peruvian mines were long, and, perhaps, are still prevalent in Europe, they have, no doubt, furnished vast supplies of the precious metals. The famous mine of Potosi in Bolivia, or Upper Peru, was discovered by accident in 1545: it produced, for a lengthened series of years, vast quantities of silver; but it is now comparatively neg-

lected, and is supposed to be nearly exhausted. The greater number, as well as the most productive of the mines that are at present wrought, are situated in the Cerro di Pasco, in the dep. of Junin. They were, like Potosi, accidentally discovered in 1630.

The produce of the Peruvian, like that of the Mexican mines, has materially declined since the commencement of the revolutionary struggle. Humboldt, who had the best means of obtaining accurate information, estimated the annual value of the gold and silver produced in Peru at the commencement of the present century, at 6,240,000 dols. (1,248,000*l.*) But at present (1841), owing to the anarchy and insecurity that has prevailed, their value is probably not much above half this amount. The silver smelted in Peru, from 1820 to 1834, is said to have amounted to 3,296,573 marcs, worth 5,604,175*l.*

The following is a statement of the quantities of silver reduced to bars at the different smelting-houses of Peru in 1834 (*Board of Trade Tables for 1839*):—

Departments.	Marcs.	Departments.	Marcs.
Lima - -	15,821	Ayacucho -	2,417
Truxillo -	15,267	Puno -	31,379
Junin (Pasco) -	272,558	Arequipa -	4,562
Total - -	341,804	marcs, worth 581,068 <i>l.</i>	

It is estimated that over and above the quantities given above, 1-3d part more is actually raised in the different departments, except in Junin, where 1-5th part of excess is produced, and smuggled out of the country in the state of *plata pila*, or native silver. In 1838, 900 marcs of gold, and 287,258 oz. of silver were coined at the several mints of Peru. Perhaps, on the whole, allowing for smuggling, &c., the total produce of the gold and silver mines of Peru, including Bolivia, may now (1841), amount to from 700,000*l.* to 750,000*l.* a year.

Huancavelica has one of the richest quicksilver mines in the world, one portion of which (St. Barbara), furnished 5,000 quintals a-year of quicksilver, for 2 centuries. It is said that the metal might be procured here at an expense of 65 dols. the quintal; though, in 1837-38, quicksilver was so scarce in Peru, as to cost from 200 to 220 dols. per quintal. These mines were then, of course, unwrought; but a private company has since been formed to work them, which has proceeded to a considerable extent with its operations. (*Smith's Peru*, ii. 24.)

Exclusive of the above Peru produces iron, copper, tin, coal, saltpetre, &c. The latter, indeed, under the name of nitrate of soda has, within the last few years, become an important article of export.

Vegetable products are numerous, and very dissimilar. Sugar, rice, tobacco, yams, sweet potatoes, and cocoa, are raised in the warmest situations; the vine, wheat, and quinoa (*chenopodium quinoa*) are planted in colder places, and potatoes on the highest cultivated grounds. The grapes are well-flavoured, but the wine made from them is inferior. The sugar cane is mostly the creole species. Three sorts of maize are cultivated, and this grain, which forms the principal farinaceous food of the modern inhab., appears to have been also the principal formerly in use among the Indians, large quantities having been discovered in subterranean granaries, where it had probably remained from a period previously to the Spanish conquest. Cotton is grown in almost every part of Peru, and the Peruvian ranks immediately after the Sea Island and Egyptian cotton in the English markets. Except in the prov. Piura, it is all short stapled. The culture is rapidly increasing, and it may now be considered one of the staple products of the country. Lucerne is a good deal grown for provender: it reaches the height of three feet, and is cut five times a year. Culinary vegetables abound; beans, with potatoes, forming the principal food of the lower classes in the uplands. Olives succeed well in certain districts, and oil is extensively produced, but it is inferior to that of France or Italy. Plantain, bananas, guavas, and other tropical fruits, with oranges, lemons, nectarines, plums, and others common to Europe, are found in great profusion. Bark, and numerous medicinal plants, with cedar, ebony, mahogany, walnut, and other valuable timber trees abound in the forests. The valuable and well known drug called Peruvian bark consists of the rind of the *cinchona lancifolia*, *oblongifolia*, *cordifolia*, &c., and is, consequently, of several varieties. The genus *cinchona* is supposed to be confined to the Andean ranges between lat. 10° N. and 22° S., where it grows luxuriantly to the height of 10,000 ft. above the sea. The provs. of Loxa, Ecuador, and Huanuco, are those in which the bark is principally obtained; and during a lengthened period after its first introduction into Europe in 1640, it was called Loxa bark, from the former of these provs. Its collection begins in May and continues till November. The trees are cut down close to the root; the stems are then divided into pieces of uniform length: and about three or four days afterwards the bark is taken off in broad stripes. The price which

the article fetches depends on the rapidity with which it is dried, which is effected by exposing the bark with the least possible delay to a hot sun, which makes the pieces roll up and sometimes form a solid cylinder, without any cavity in the centre. It is afterwards carefully packed in bales of 4 or 5 arrobas each, and exported in chests closely covered with skins. (*Poeppig, Com. to Bot. Mag.* i. 249) Coca, the dried leaf of the *Erythroxylon coca*, is largely used by the Peruvians for chewing, much in the same way as betel in the East. Poeppig says that indulgence in its use brings on a gloomy kind of mania; but other authorities deny that it has any such effect.

Agriculture, which was never in a prosperous state, has, like every other branch of industry, been greatly neglected since the revolution. Dr. Smith gives an account of the agriculture of a district between the Cordilleras, which he says may serve for that of the *Sierra* generally. "The agriculture of Huanuco, though alluring to the eye of the ordinary traveller, who only glances at its rich and waving fields of maize, inclosed within tapias or fences of mud, and hedges of the Indian fig and aloe or maguey plants, is in every way defective. The fields owe their luxuriance to nature rather than man, except in the single advantage of water, which he often directs and supplies to them. Manure is a thing never thought of; and the implements of husbandry are of the rudest kind. The plough, slight and single handed, is constructed merely of wood, and without a mould-board. The ploughshare is a thick iron blade (or, where iron is not at hand, a piece of hard iron-wood), only tied, when required for use, by a piece of thong, or lasso, on the point of the plough, which divides the earth very superficially. Harrows they have, properly speaking, none; but sometimes use, instead, large clumsy rakes, or a green bough dragged over the sown ground, with a weight upon it to make it scratch the soil. Instead of the roller, they break down the earth intended for cane-plants, after it has got eight or ten ploughings and cross-ploughings, with the heel of a short-handed hoe. For smoothing down the clods of earth, some Indians use a soft, flat, round stone, about the size of a small cheese, which has had a hole beaten through its centre by dint of blows with a harder and pointed stone. To the stone thus perforated they fix a long handle; and as they swing it about they do great execution in the work of *cuspiando* or field levelling. Lucern, or *alfalfa*, is cut down, and used green, cattle and working oxen for the plough and sugar-mills being fed on it; yet the scythe is not in use among the great planters, who find it necessary to keep two or three individuals at the sickle to cut down food for herds, which, in the day time, are fed on irrigated pastures, but at night in corrals or pens. The inhabs. are accustomed to break up potatoe grounds on the face of steep slopes with deep narrow spades having long handles. In the same manner the soil is turned up by those who have neither plough nor oxen, but who yet sow maize on the temperate flats on the hill sides. People thus circumstanced make holes in the ground with a sharp pointed stick, where they bury the seed. The Indian sows the white grained maize in preference to the yellow, as he considers that when toasted it makes the best "*cancha*," or substitute for bread; and that when boiled it makes the best "*mote*," or simply boiled maize: it has moreover the credit of making the most savoury *chicha* or beer, which they home-brew whenever they have a little surplus grain. They also make a kind of beer from the fermented juice of the maize stalks compressed between small rollers of wood turned by the hand. Dry maize leaves and stubble are most used in the foddering of cattle. The sugar mills in the valley of Huanuco are mostly made of wood, and wrought by oxen. On the larger estates small brass rollers are used; but water-power is not thought of, the proprietors adhering to the old practice of working with oxen day and night throughout the year, barring accidents, and feasts, and holidays." (*Peru as it is*, ii. 40—46.)

The wild animals include the puma, or American lion; the uturuncu (*Felis onca*, L.), a kind of tiger cat; the acumari (*Ursus Americ.*, L.), a black bear inhabiting the mountains; the *anas*, or skunk; great numbers of deer, wild boars, armadillos, &c., which are objects of the chase; and several varieties of animals, as the llama, al paca, guanaco, and vicuna, used, especially the llama, by the native Peruvians, previously to the Spanish invasion, as beasts of burden. (Copious descriptions of these animals may be found in *Stevenson's Trav.*, ii. 85—92., and *Smith's Peru*, &c., ii. Appendix.) Four varieties of the condor are included among the native birds. Alligators are met with in the rivers; but neither the reptile nor the insect tribes appear to infest Peru so much as the country around Guayaquil and some other regions within the tropics.

Of the foreign quadrupeds acclimated in Peru, sheep appear to have succeeded best. They have increased in an amazing degree on the great commons or pastures of the Andes, at an elevation of 12,000 or 14,000 ft. above the sea. Few sheep are bred on the coast; but

during certain months, large flocks are driven from the interior, and fattened for the Lima market. Many of the ewes are in lamb, and the common bargain between the drover and the farmer is to give the lambs for the pasturage, the farmer calculating on receiving 150 lambs for every 100 ewes. Besides this increase, which is greater than in England, the ewes bear twice a year, generally in June and Dec. (*Stevenson*, ii. 2.) Little attention has been hitherto paid to breeding sheep, so as to improve the wool; but as the latter is now becoming an increasing article of export, more care will doubtless be bestowed on this object. The largest quantities of wool exported are from Islay, and are chiefly produced in the neighbourhood of Lampa, Puno, and Cuzco. It is soft and similar in appearance to English wool; but, being badly cleaned, it does not fetch more than 9d. or 10d. per lb.; that from the mountains between Lima and Pasco, being better cleaned, usually brings 1d. per lb. additional. The wool produced on the coast is of very inferior quality. Vicuna wool is exported, but only in small quantities. In the high region, cattle, horses, asses, &c., are of a stunted size; but in the valleys and on the coast they are large, spirited, and showy.

"The cattle of Peru are not so large as those of Lincolnshire; but at an average, they are as large as the English, French, and Spanish cattle: when fed on lucern, the meat is well flavoured, fat, and juicy, and the bones very small." (*Ibid.* i.) The black cattle of the Sierra do not agree with the climate of the coast, and when brought there speedily die. Ordinary horses and mules fetch from 45 to 50 dolls. each. Piura is noted for its excellent breed of the latter, and many mules are taken thence to Truxillo, Lima, &c., where they sometimes fetch 250 dolls. each. The same prov. is also famous for its goats. A good many pigs are reared in Peru; they are considered fit for market at from 10 to 16 months old, when they sell at from 6 to 9 dolls. each, if of a good breed.

The Population consists principally of native Indians, Spaniards, negroes, and the races of mixed origin derived from the foregoing; but of the number of each we have no authentic estimate. The accounts of the Indians given by recent travellers are in many respects conflicting and various; we believe, however, that the statements of Ulloa may, on the whole, be safely depended on. That excellent observer represents them as in the lowest stage of civilization, without any desire for the comforts and conveniences of civilised life, immersed in sloth and apathy, from which they can rarely be roused, except when they have an opportunity of indulging to excess in ardent spirits, of which they are excessively fond. (*Voyage* ii., liv. vi. cap. 6.) With the exception of Mr. Stevenson, most recent travellers say that they are dirty in the extreme, seldom taking off their clothes even to sleep, and still more rarely using water. (*Modern Traveller, Peru*, p. 286.) Their habitations are miserable hovels, destitute of every convenience or accommodation, and disgustingly filthy. Their dress is poor and mean, and their food coarse and scanty. Their religion is still tainted with the superstition of their forefathers; but they are great observers of the external rites and ceremonies of the church, and spend large sums of money in masses and processions; a species of profusion to which they are excited and encouraged by their priests, who profit by it. We have previously made some statements illustrative of their attainments in the arts at the epoch of the Spanish invasion. (*See* Vol. I. 84.) The oppressions to which they have since been subject have probably sunk them to a lower point in the scale of civilization than they then occupied; and, no doubt, it would be possible, were proper care taken, materially to improve their habits and condition. A good deal, too, of their apathy and little progress in arts and industry, must be ascribed to the physical circumstances under which they have been placed—the mildness of the climate and the fertility of the soil, which, on the one hand, by diminishing their wants, and, on the other, by enabling them to supply those which they do feel with comparatively little exertion, take away and greatly weaken some of the most powerful motives that prompt to labour and invention. Still, however, we are well convinced, notwithstanding the statements and reasonings to the contrary of M. d'Orbigny* and others, that the Indians are naturally an inferior race, and, indeed, wholly incapable of any degree of civilization.

The principal burden to which the Indians were subject, under the Spanish government, was that of the *mita*, or compulsory labour in the mines. All male Indians from 18 to 50 years of age were compelled, during a certain specified period, to undergo this servitude. Its severity had, however, been materially abated previously to the revolution, and it was then entirely suppressed.

Manufactures are in a very backward state, though many of the natives evince considerable ingenuity. In Tarma they make ponchos, or loose cloaks, of great beauty and fineness, and on the colder table lands warmer

* See the learned work entitled *L'Homme Américain*, parian.

coarser blankets, ponchos, &c. In the valleys, good ones are made into overcoats, over-blankets into anoraks, and travelling shoes for men and travelling and cattle-drawling from rubber. Carriage for packing is borrowed from the mule-trail in Potosi, and at C. enough is for the San Miguel silver-work, for which indeed Potosi is famous. But in general, the manufactures of Europe or, in the larger towns, superadded those of the natives, and are supplied to Peru in exchange for raw wool.

Produce — Bullock is by far the most important of all the latex exported from Para. Its value may be put at \$500,000 enough to show 1,000,000 a year. Among the other articles are sheep, chrome, and sheep & wool, of which are imported 2,000,000 lbs. In 1905 salted, tallow, sugar, corn, hides, cotton, scientific china, etc. The latter is shipped in large quantities to the ports of the coast right from some way inland in the interior of the islands rather than 10,000,000 tons, over 10,000,000 tons!

Porto, the guano of it which has been by the parts of Africa. chiefly of FALLO and the exports from this country to Porto, in 1840, amounted to \$750,000. They consist principally of cotton, wool, and iron manufactures, especially the first machinery and mill work, hardware and cutlery, shawls, &c. &c. The imports

C Account of the Different Articles (or Goods), exported from Peru to 1816, with their Value

[illegible]

In addition to the above articles of produce there were also exported an British account, as returns for goods sold in Peru, the produce of *Equisetum*, *New Granada*, and other America, to the amount of 11,000. The exports of bark, sugar are from Bolivia, Characilla skins, salt etc. are manufactured a considerable business in the trade near the previous point the export of wool skins and distillates. Medea cannot become an article of very considerable export, for though the greater part of the animal timber for shoes, etc. is imported from Ecuador, or from the west of Indian tribes on the coast and this lands, Medea are necessarily used as a substitute for wool. The export of all articles of native produce, except the previous metals, is free of duty.

The remains of the Indian road, ascending through the entire of Peru from Quilo to Cuzco, a distance of 1,200 *o.*, may, according to Humboldt, be compared with the great Roman roads though, when it is recollected that the Peruvians were ignorant of the gun, and that their bridges were made of cane reeds, this statement will certainly appear not a little extravagant. Various dams were also cut by the steep acclivities of the Andes of the Peruvians before the Spanish conquest. The quia led down by the European masters of the country was no comparison with the foregoing. They consist, indeed, with a few exceptions to the vicinity of the large towns, only of low tracks for horses or mules and, in most of fact, goods are exclusively conveyed on the backs of the Indian. In the day of late, however, Dr Smith says that inevitable efforts have been lately made for improving the roads but no regular post houses are yet established, and at this moment the want of such and of improved means of communication, is the leading obstacle to the improvement of the country. He says to this the case, that Lima and some other towns being the only and it more convenient to receive supplies of goods from Chili by sea than from the interior of their own country. We have elsewhere described the great of roads in use in the Andes (see art. *ANDAS*, Vol. I. 124, 125).

The Government is popular and representative, the authority, in theory at least, consisting from the

people. Peru has a census or chapter of deputies, consisting of an immense number of members, which delegates the executive power to a president and the other high authorities of the state. The chamber of deputies consists of representatives elected by the electoral colleges of towns and parishes. The parishes electoral colleges consist of all the citizens resident in a par. In every 100 of whom one citizen is nominated and in every village with an average of pop. exceeding 10, in some no village, a municipal body is established, subject to the appointment of the departmental juries. The electoral colleges of towns are composed of parishes chosen constituted according to law. The elect. depts. in conformity to the proportion of 1 for every 10,000 inhab. The prov. however in which the whole pop. does not come up to 10,000, may nevertheless send a deputy. The government of every dept. is vested in a prefect that of a prov. in a sub-prefect, that of a district in a governor and that of every town or Indian village in an alcalde who is entrusted with the command of the local police. To fill the foregoing appointments, it is required that the candidates should be an active and approved citizen above 25 years of age. The prefects are charged with the economical administration of their respective depts. but are strictly prohibited from interfering with the course of popular elections, or the functioning of departmental juries. The latter are bodies sitting in the cap. of each dept. composed of 8 members from each prov. chosen in the same manner as the members of the senate and whose functions include the enacting of laws, examining the accounts and determining the military force of the dept.

Justice in all the days is administered in the name of the Republic and in every house are justices of the peace whose business it is endeavor to bring about an amicable termination without a formal law suit. Few suits come to trial, adjusted without some preliminary attempt at settlement. In some parts the functions of the judge are exercised by the sub-pretor. Justice is not used to be positively corrupt but, the law being ill understood by many judges, favoritism, civil suits especially have been frequently decided on erroneous grounds. Few of the municipalities have revenue adequate to the maintenance of a sufficient police, the latter is said to be better in Lima than in the other days. The poor people are bad and increase. Slavery is outlawed except as respects those who were taken previously to the declaration of Peruvian independence in 1820. Except these individuals, a traffic in human beings as in the interior every one enjoys the right of citizenship, retaining only negroes, gamblers, drunkards, and those who without cause abandon their wives, or are divorced on account of misconduct.

The same religion is the Roman Catholic and Paraguay having been the country in which the strict education of Spain was perhaps more felt than in any other of her transatlantic possessions, a great deal of intolerance was formerly shown toward individuals of a different creed; though we believe a considerable portion of this has disappeared since the establishment of the republic. Louis is the seat of an archbishop who holds the chief ecclesiastical authority. The Jesuits in the 17th century and afterwards the Franciscan monks established various Indian missions in the E. parts of the country. But these have almost all gone to decay, and the famous missionary college of Ocopa, almost 100 E. of Lima, superseded at the revolution, but afterwards restored in its means flourishing, and many Indians of the interior are receiving a good education. The clergy are said to be more a of their duties, and less in their morals. The Indians and castes are often men chattering and doing hard bargains in relation to fruit trees, the trees are cultivated by the state, marriage, burials, and religious festivals, which latter are chiefly interwoven with the native social system of the country. The poorer castes are more commonly found worn out in reconstruction at the age of 40. These gentlemen when their home becomes burdensome, start off swayed by some outside impulse, to the nearest town of white Indians where they enjoy a finer climate and more gratifying company. The custom of unnecessarily resorts to a mining village outside perhaps, of visiting his parents, or fruit trees, in grain, gambling with the miners day and night, till the parents be all swallowed up, and the poor wretched returns home involved in a debt which he cannot pay for the next six months, even should his salary be worth 1,000 or 1,500 dollars a year though it be often much less. (Forn. & Co. 1 311 312)

Subjects for reading on the Lamsatristra plan, are common to the capital and exist in the larger provincial towns, and all the white children are taught the elements of instruction. Lima has a university and several other colleges, but the former has white more than 50 students, and the latter establishments have mostly dwindled into insignificance. Superior education is confined to a very few among the whites, and amounted almost universally (when provisions of useful instruction: the negroes and Indians have rarely any situation

except what is necessarily acquired in the ordinary intercourse between man and man. There are some good libraries in the cap., and a medical college; but medical science generally is at a very low ebb. In the rural districts especially, what is called medicine is the grossest quackery; and other branches of general science are not in a much better condition. There are few hospitals or other charitable institutions, such foundation having been mostly suffered to fall into decay.

The constitution provides that a national militia shall be raised throughout the country; but in most of the provs. it can hardly be said to exist, except in name. The standing army is estimated at 3,000 men, and the naval force is quite insignificant. (*Smith, Peru as it is*, ii. 65—142.) We cannot form any clear estimate of the public revenue and debt of this state: the *Weimar Almanack* roughly states the probable amount of the latter at 20,000,000 piastres.

History.—When the Spaniards under Pizarro and Almagro arrived in Peru, in 1532, they found that country under the dominion of the Incas, who, according to the traditions of the Indians, had held the sovereignty about four centuries. The first Inca, Manco Capac, had either immigrated from some distant country or been a person of very superior acquirements. He pretended that his sister, Ocollo, whom he married, and himself were children of the sun, and that they were sent to instruct the rude and barbarous natives in the duties of religion, and in arts and civilisation. He made Cuzco the cap. of his dominions; and, having erected a temple to the Sun in that city, appointed 12 virgins of the blood royal to act as priestesses to the divinity, and became both the high-priest and law-giver of his people. The government and manners of the Peruvians were, as compared with those of the Mexicans, mild in the extreme. Still, however, a considerable number of the attendants of the Incas were sacrificed on their death, and interred with them, that they might appear in the next world with their former dignity, and be served with the same respect. The remains of the roads, aqueducts, palaces, temples, and other structures, scattered over the country, attest the advanced state of civilisation at which the Peruvians, as compared with most other Americans, had arrived. The empire of the Incas fell an easy conquest to Pizarro and his bloodthirsty comrades. It continued in possession of the Spaniards till 1821, when Lima, having submitted to a Chilean army under San Martin, its independence was declared on the 28th of July. Since that time Peru has been, like the other *ci-devant* Spanish colonies, involved in all but perpetually occurring vicissitudes. (*Ulloa; Robertson's America; Stevenson's Residence in Peru; Smith, Peru as it is; Humboldt; Hall; Miller; Geog. Journal, &c.*)

PERUGIA (an. *Perusia*), a town of the Papal States, cap. deleg. of the same name, nearly in the centre of the Italian peninsula, and on the main route between Rome and Florence, about equidistant from the Mediterranean and Adriatic, and 85 m. N. Rome; lat. 43° 6' 46" N., long. 12° 23' 13" E. Pop. 30,000. It stands on the summit and declivity of a hill, 700 or 800 ft. in height. It is fortified, though not strongly; being defended, exclusive of its walls, by a castle, erected by Pope Paul III., in 1543. It is irregularly laid out, but well-built, and has several public buildings and remains of antiquity that are worth notice. The cathedral is a large Gothic edifice, which would be handsome, were it not so party-coloured. Like many of the other churches, it is rich in works of art, having paintings by Barrocci, Guido, and Perugino, exclusive of four famous pictures by Raphael—the Annunciation, Circumcision, Assumption, and Adoration of the Magi. The churches of St. Dominico and St. Francisco are interesting; the last being a very handsome specimen of early Italian architecture. The *palazzo pubblico* is a remarkable specimen of Italian Gothic. Among the antiquities are an arch, reported to have been built by Augustus, though, according to Mr. Wood (*Letters of an Architect*, ii. 104.), it is probably later; a circular building, still tolerably perfect, which is evidently of Roman origin. There are numerous public fountains; one of which, in the principal square, has been ornamented with bas-reliefs and statues by Arnolfo da Lapo. Perugia has a university, with about 200 students, several academies, numerous convents, two theatres, a bull-ring, and an admirable ground for playing *pallone*. This city is the residence of a Papal delegate, a bishop's see, the seat of a tribunal of primary jurisdiction, and a board of police, and the residence of the directing engineer of bridges and roads for the delegs. of Perugia, Spoleto, and Rieti. It has manufactures of carpets, silk goods, prepared skins, hats, cream of tartar, soap, and wax-candles, and some trade in wines, oil, and other agricultural products.

Perugia is scarcely inferior in antiquity to Cortona, and was its equal in rank among the cities of Etruria. Antony having shut himself up in the city, it was taken, after a stubborn resistance, by Octavius Cæsar, who dismissed Antony; but the city was hardly dealt with, more, as Velleius says, through the irritation of the soldiers than

the inclination of the general. (lib. ii. cap. 74.) It was annexed to the Papal dominion by Julius II., in 1512. The famous painter, Vanucci, surnamed Perugino, was a native of this city. (*Wood's Letters of an Architect; Stmond, &c.*)

PESARO (an. *Pisaurum*), a coast town of central Italy, Papal States, leg. Urbino, on the Toggia, near its mouth, in the Adriatic, 20 m. N. by E. Urbino; lat. 43° 55' 10" N., long. 12° 34' 5" E. Pop. about 15,000. It is surrounded with fortifications, and is well built. The streets are clean and airy, and it has in general a neater appearance than most towns of Italy. Its market-place is ornamented with a fountain, and a marble statue of pope Urban VIII. Being the see of a bishop, it has, of course, its cathedral, and the usual complement of churches and convents. It has no harbour, but merely an open roadstead. Some of the churches are remarkable for their paintings, as are several of the houses of the higher ranks. The palace of the former dukes of Urbino is now occupied by the Papal legate. There are many handsome private residences, 2 hospitals, a foundling asylum, a good theatre, &c. The aqueduct, which conveys water to different parts of the town, is supposed to be a work of the Romans; and there are the remains of an ancient bridge and theatre. Silk and cotton stuffs, glass bottles, cream of tartar, &c., are produced on a small scale; but the inhabs. are principally employed in the trade in agricultural produce, the surrounding country, which is rich and well-cultivated, producing the best figs in Italy, with wine, olives, silk, &c. There are several handsome villas in the vicinity; one of which was occupied, in 1818-19, by Queen Caroline of England. *Pisaurum* was a Roman colony. It is noticed by Catullus,

— moribunda sede Pisauri.

Carm. 82.

But the defects in its climate, which made it be so characterised, have been to a considerable extent obviated by the drainage of some adjacent marshes. The famous musical composer, Rossini, was a native of, and resident in this town. (*Rampoldi, Woods, Starkc, &c., passim.*)

PESHAWER (The "Advanced Post"), a considerable city of Afghanistan, cap. of a principality of the same name, which for some time belonged to Runjeet Singh, but which is now, probably, included in the dom. of the Caubul sovereign. It stands in a nearly circular plain, about 35 m. in diameter, and watered by many branches of the Caubul river, 140 m. E. by S. Caubul, and 236 m. N.W. Lahore; lat. 34° 6' N., long. 71° 13' E. Pop., formerly estimated by Mr. Elphinstone at 100,000, but it is now certainly much less. It is built on uneven ground, and is upwards of 5 m. in circ. The houses are mostly built of unburnt brick, inclosed in wooden frames, and are commonly three stories high; the lower story being usually occupied by shops. The streets, though narrow, are paved, and have a kennel in the middle. Two or three brooks run through the town, skirted with willows and mulberry-trees, and crossed by bridges. There are many mosques, but no public building is said to deserve public notice, except the *Bala Hissar*, or citadel, and a fine caravanserai. The former, a castle of no strength, on a hill N. of the town, commands an extensive and beautiful view, and when visited by Mr. Elphinstone in 1809, had some fine halls, and was surrounded with spacious gardens, being the occasional residence of the king of Caubul; but when Moorcroft saw it about a dozen years afterwards, it was a heap of rubbish, and the only use made of it by its Seikh rulers was as a quarry whence to procure materials for dwellings of their own erection. Many of the houses in the city were also, at the latter period, untenanted and in ruins; in the plain numerous villages were deserted; and in the immediate vicinity of the town the Seikhs had inflicted more mischief than many years' labour could remedy, by destroying gardens and orchards, and demolishing the wells, and channels of irrigation. (*Moorcroft's Trav.*, ii. 337.)

Peshawer is well situated for trade, and should the Indus come to be extensively navigated by British vessels, Peshawer would most likely become a considerable entrepôt for the trade between India and Afghanistan, Khorassan, and the countries N. of the Hindoo Koosh. The inhabitants are very mixed, but principally of Indian origin, and occupied in commerce. The shops are well supplied with fruits and other provisions, saddlery, boots and shoes, woollens, hardware, books, and other manufactured goods.

It is said by some authorities to have been founded by Acber; but the district of Peshawer is mentioned in the histories of the 10th century; and it is more probable that it should have taken its name from a city already existing, than the reverse. Peshawer was, however, greatly improved and enlarged by Acber, in the 16th century. (*Elphinstone's Caubul*, l. 72—81; *Moorcroft's Travels*, ii. 337, 338; *Burnes's Bokhara, &c.*)

PESTH, a city of Hungary, on the E. side of the

Danube, 135 m. E. S. E. Vienna, immediately opposite Buda, with which it is connected by a magnificent suspension bridge, opened in 1848. (See BUDA). It is the seat of the chief judicial tribunals of the country, as Buda is the residence of the viceroy and other chief state authorities. Pop. (excl. garrison and strangers), about 13,000, principally R. Catholics; or, together with Buda (which see) and its suburbs, probably 110,000. (*Berghaus*.) Pesth, with its suburbs, occupies a space about 6½ m. in circ. It stands on level ground; and being almost wholly of modern date, is much more regularly laid out and handsomely built than Buda. The streets, which are mostly wide and straight, are paved and partially furnished with trottoirs, some of them being, in the splendour of their shops and their elaborately painted signs, little inferior to those of Vienna. "After a fashion, once common with us, and of which one or two specimens still exist in London, every shop has a name and sign; so that you may buy your cigars at the *Young Prince*, your ravats at the *Three Graces*, and bonbons at the *English Lord*; and for the instruction of those who do not read, or to attract the attention of those who do, these subjects are all illustrated by large paintings, in a style by no means contemptible." (*Paget's Hungary*, i. 243-4.) The squares are generally very well built; but from the want of some object in the centre, they look bare and deserted; besides affording room for the accumulation of those heaps of sand with which the city is infested, but which might probably be prevented by planting round the outskirts. The growth of Pesth within the last few years has been most rapid. Along the riverside, which, a few years ago, was nothing but a marsh, is now a wide quay, partially paved and walled in, and lined for upwards of 1 m. by a succession of handsome buildings. Near the centre of these are the new theatre, and *Kedonten-saal*, or public hall-room; and at one end, ornamented with a portico like the last named edifice, is the National Casino, an institution similar to the clubs of London, established by Count Szechenyi. It is open to strangers, who may use it during their stay in Pesth, and its reading-room is furnished with the leading newspapers and magazines of Europe. A part of the establishment is appropriated as a Casino for tradesmen; and in the centre of the building is a very fine ball-room. Among the most conspicuous of the public edifices is the *Neugebäude*, in the suburb of Leopoldstadt, begun by Joseph II. in 1786; a structure of immense size, 4 stories in height, inclosed round 4 spacious areas, and now used as a barracks and artillery *dépôt*. Pesth has only a small number of churches in proportion to its size and pop., and none particularly distinguished for architectural beauty. Service is performed in them according to the United Greek, R. Catholic, Dissenting Greek, Lutheran, and Calvinistic rituals; and in the German, Hungarian, Slavonic, and Greek languages.

There are also several synagogues. Besides the large theatre on the quay, an elegant new national theatre, destined solely for Hungarian performances, has recently been completed by the aid of a grant from the Diet. The grenadiers' barracks, county hall, Jesuit college, and two or three of the hospitals, are worth notice. But, in respect of public buildings, Pesth must yield to Buda; it has, however, many noble palaces and other private residences, and excellent hotels and coffee-houses.

This city is also distinguished by its establishments devoted to the higher branches of scientific instruction. A university, established at Tyrnau in 1633, and transferred thither from Buda, by Joseph II., in 1784, is the only one in Hungary, and one of the most richly endowed in Europe. The instruction is entirely gratuitous; and it has about 50 professors, an observatory on the Blocksberg in Buda, a large botanic garden, a veterinary hospital, and a library of 60,000 vols. In 1846, it had about 1,000 students. The National Museum, founded in 1802, has a fine library, rich in Hungarian MSS.; a complete collection of Hungarian coins from the 10th century; collections of minerals, fossils, antiquities (principally Roman, and others, found in Hungary and Transylvania); historical relics, specimens of manufactures, &c. The Hungarian academy of sciences, originally founded for the cultivation of the Magyar language, has received many munificent donations, and has an income of about 2,000*fl.* a year. It publishes transactions, and gives annual prizes for the best works in Hungarian. Pesth has, also, a gymnasium, Rom. Cath. and Lutheran seminaries, an English conventual school for noble ladies (*Englisch Fräuleinstift*), a teachers' seminary, many primary, and Greek, Protestant, and Jewish schools, a mad school, &c. The chief judicial tribunals are the *Curia Regia*, or Royal Table, and the *Septemviral Tafel*, termed because it originally consisted of 7 members, but was extended so as to include the palatine, 4 prelates, 9 magistrates, and 7 other nobles. There are various charitable institutions. Several newspapers are published in the Hungarian language. Though near the extreme verge of European civilisation towards the E.,

Pesth has all the appearance and conveniences of a city of W. Europe. It is well furnished with provisions of every kind, and, in some respects, its inhabs. are better off than those even of the capitals of England and France! "The *fiacre* is none of the heavy, shabby, slow coaches found on the stands of London; but a very clean, smart, open calèche, with two high-bred little horses, which whisk along at a famous rate; and a driver as far superior in sharpness and wit to his wooden-shod confrère of Paris, as the equipage is to that of London. In winter, instead of the open calèche, a neat close chariot takes its place; for he is a very poor *fiacre*, in Pesth, who has not a winter and a summer carriage." (*Paget*, i. 230.)

The greatest variety of costume may be seen in Pesth, especially at the four great annual fairs, which are attended by at least 30,000 strangers, many of them from very distant parts. The business transacted at these fairs is very extensive. (See *Bright's Travels in Lower Hungary*, pp. 217-223.)

Pesth manufactures silk and woollen fabrics, leather, straw hats, oil, tobacco, &c.; but its principal manufacture is that of *meerschaum* pipe-bowls. These, which consist of the species of earth called *kaf-kil*, dug in the Crimea, are first rudely fashioned in Constantinople, but are finished for the German markets in Pesth. They are thence conveyed to Vienna, and ultimately to the fairs of Leipzig, Frankfort, Mannheim, &c.; where the best fetch from 3*l.* to 5*l.*; and even 7*l.* sterling. A considerable intercourse is kept up between Pesth and Buda; all classes pay toll on passing the bridge.

The amusements of both cities differ little from those of the German capitals. The theatres, coffee-houses, and public gardens in the neighbourhood are the favourite places of resort. Immediately beyond the barriers of Pesth is the *Rákotz Mező*, a wide plain on which the diets of Hungary were held for many centuries; and on a part of which horse-races, somewhat after the English fashion, are now held yearly in May or June.

Pesth is supposed to occupy the site of the *Transacincum* of the Romans, on the ruins of which a town was afterwards built by Arpad. Bela IV., in the 13th century, surrounded the town with walls; and it subsequently rose to considerable commercial importance. It was held by the Turks 160 years. The present town, one of the best built and handsomest in the Austrian dominions, may be said to have wholly grown up since the reign of Maria-Theresa. It suffered severely in 1838 from an inundation of the Danube, which is said to have destroyed 1,200 houses in the older part of the city. (*Æst. Nat. Encycl.*; *Berghaus, Allg. Länder, &c.*; *Paget's Hungary*, i. 229-245.; *Bright's Travels in Lower Hungary, &c.*)

PETERBOROUGH, an episcopal city and parl. bor. of England, in liberty of its own name, co. Northampton, on the navigable river Nen, crossed here by a wooden bridge, 37 m. N. E. Northampton, and 75 m. N. by E. London. Area of parl. bor. (which includes the entire par. of St. John the Baptist, with the Minster precincts), 1,430 acres. Pop. in 1841, 6,991. This small city consists of several streets close to the N. bank of the river, regularly laid out, well-paved, and lighted with gas, the houses generally being well-built, and some of recent erection. The principal public building is the cathedral, formerly attached to a Benedictine monastery, founded here in 870, and regarded at the Dissolution as one of the most magnificent abbeys in the kingdom. It is a regular cruciform structure of Norman and early English architecture, erected during the 12th century. The dimensions of the interior are, length, 476 ft.; breadth of nave and aisles, 78 ft.; breadth, including the great transept, 203 ft.; breadth of transepts, 69 ft.; height of ceiling, 78 ft.; ditto of lantern, 135 ft.; length of the W. front 156 ft.; height of the central tower, 150 ft. A tower and spire once stood over the N. W. transept; but the latter has been taken down. The approach to the cathedral has a very monastic appearance. "Passing under a Norman gate, with later additions, a court is entered, the right side of which is formed by the domestic buildings of the abbey; and at the end is the noble front of the church, consisting of three fine early English arches; but their beauty is much impaired by the small chapel or porch, which, in another place, would have been very beautiful. The E. end is circular, and the aisles are made out square by perpendicular additions. The choir has a wooden groined roof of very inferior workmanship: a handsome stone screen has recently been substituted for one of wood, and the fittings of the choir have been entirely renewed, under the direction of Mr. Blore. The nave is a very good specimen of that description of Norman work which has its piers composed of shafts; the proportions are good, and the general appearance is fine, without that overwhelming heaviness seen in those edifices where the great circular piers are used." There are few monuments, shrines, or chantry chapels, the parliamentary troops having plundered the church of most of its ornaments of this description. Catherine of Arragon and Mary Queen of Scotland, were interred

here; but their graves are not marked by any sepulchral monument. "The remains of the monastic buildings in the court fronting the cathedral are of somewhat varied style, but present, on the whole, a valuable specimen of bold and varied outline, both of plan and elevation. In the same court, also, leading to the cemetery on the N. side of the church, is a late perpendicular gate remarkably rich in ornament, and near the S. transept are some remains that may have been the refectory, or infirmary chapel of the ancient monastery." (*Rickman's Gothic Architecture*, p. 209.) The cathedral corporation consists of the dean and six prebendaries, who divide among them a nett revenue of 5,118*l.*: there are also four minor canons and a precentor. Peterborough was erected into a bishop's see by Henry VIII., and the diocese now comprises the cos. of Northampton, Rutland, and Leicester. The nett revenue of the see amounted, at an average of the three years ending with 1831, to 3,103*l.* a year; but it has been since augmented by an order of council to 4,500*l.*, the deficiency being supplied from the surplus funds contributed by the larger sees.

The par. church is a spacious building, lately remodelled, and put in very complete repair: the living is a vicarage in the gift of the bishop. The Independents, Baptists, and Wesleyan Methodists have also their respective places of worship, and there are Sunday-schools attended by upwards of 200 children of both sexes. The cathedral grammar-school, founded by Henry VIII., is attended by about 30 boys, and endowed with 3 scholarships and a fellowship at St. John's College, Cambridge. There are 2 charity-schools for boys, and a national school is attended by about 300 boys and 120 girls. There are numerous other charities, including a pretty large infirmary and a dispensary. The town-hall is a small but neat structure, the area beneath being used as a market-place. The gaol and house of correction for the city and liberties are both "small and miserably deficient in accommodation." (*Prisons' Report*.) There is also a small theatre, open during the summer months.

The trade of Peterborough arises chiefly from the transit of corn and malt, large quantities of which are brought down the Nen from the interior; it also imports coal, timber, bricks, stone, and other goods. The city is not incorporated, but is under the jurisdiction of the dean and chapter, whose steward holds a court for the trial of civil actions within the city. Quarter sessions are likewise held here for the liberty of Peterborough, and it is one of the polling places at elections for the N. division of the co. Peterborough has returned 2 mems. to the H. of C. since the 1 Edward VI., the right of election down to the Reform Act being in the inhabs. paying scot and lot. The electoral limits were enlarged by the Boundary Act, so as to include with the old bor. the remainder of the par., and the extra-parochial precincts of the cathedral. Registered electors, in 1849-50, 542. Markets on Saturday: fairs, July 1. and Oct. 1., chiefly for cattle.

PETERHEAD, a parl. and mun. bor. and sea-port of Scotland, co. Aberdeen, on the point of a flat, rocky, promontory, projecting into the German Ocean, 27 m. N.N.E. Aberdeen; lat. 57° 32' N., long. 1° 47' W., being the most easterly point of land in Scotland. Pop., in 1841, 5,759. Peterhead was erected into a bor. of barony by the family of Keith, earls marischal, on whose estate it was built, in 1593. On the attainder of that family, it was purchased by the York Buildings' Company, who sold it to the governors of the Merchant Maidens' Hospital of Edinburgh, who are now the superiors of the town, and have always been its liberal and munificent patrons. It did not, however, attain to any distinction till about 1770, soon after which the famous engineer, Smeaton, was employed to construct a harbour on the S. side of the promontory on which the town is built. This harbour, though on a small scale, was sufficient to demonstrate the importance of the place, and the advantage that would result, not merely to the town itself, but to the shipping employed on the E. coast of Scotland, from the improvement of the harbour. In consequence measures have been undertaken and carried into effect during the present century for excavating the rocks that obstructed the S. harbour, and for constructing a new and extensive harbour and graving dock on the N. side of the peninsula. These great works have since been completed, at an expense of above 30,000*l.*, and Peterhead has, in consequence, been rendered one of the best harbours on the E. coast of Scotland. The area of the S. harbour is 6-6, and that of the N. nearly 11 acres. They are formed by strong moles projecting into the sea. The harbour-dues, which, in 1808, amounted to only 367*l.*, had increased, in 1837, to 2,879*l.*, and are now about 3,000*l.*

"The general appearance of the town is airy and healthful; the streets are wide and well paved; and the houses are built of the fine red granite which abounds in the neighbourhood, and is an object of traffic." (*Parl. Bound. Report*.) The streets are well lighted with gas, and the town is supplied with excellent water, brought from a distance of above 2½ m. Among the public build-

ings may be specified the town-house, with a handsome spire 125 ft. in height, and the par. church, a respectable building 118 ft. in height. A handsome cross, consisting of a Tuscan pillar of granite, surmounted by the arms of the earl-marischal, was erected in 1832. The town has a fine church, an episcopal chapel, with chapels for the Associated Dissenters, Independents, and Methodists. It has, also, a scientific association, a news' room, a valuable museum, 2 public libraries, 4 branch banks, and various friendly societies. There are mineral springs within the bor. that used to be a good deal resorted to: but they are now comparatively neglected. Except ropemaking and ship-building, Peterhead has no manufactures.

In 1850 there belonged to Peterhead 33 vessels of the aggregate burden of 6,242 tons. The inhab. early engaged in the N. sea whale-fishery, and carried it on for a lengthened period with great vigour and success. In 1823, 15 ships belonging to this port brought home 2,217 tuns of oil! This, however, was the maximum of prosperity, and the business has since declined, though in the past year (1849), Peterhead had 11 ships engaged in the trade. It is now, also, next to Wick, the most important station for the herring fishery; no fewer than 85,146 bar. herrings having been cured here in 1849. The cod or white fishery is also prosecuted to a considerable extent.

The products of the fishery form, of course, a considerable portion of the exports from the port; but, exclusive of these, very considerable quantities of corn, butter, and other agricultural products, are exported. Great quantities of granite are also occasionally exported.

The Reform Act conferred on Peterhead the privilege of sending a mem. to the H. of C. in conjunction with the bors. of Elgin, Banff, Cullen, Inverury, and Kintore. Registered electors in the united bors., in 1849-50, 894; in Peterhead, only 239. The bor. has 12 councillors.

PETER-LE-PORT (ST.). See GUERNSEY.

PETERSBURG, a governm. of Russia in Europe, being that in which the cap. is situated, between 58° and 60° 30' N. lat., and 28° and 34° E. long.; having N. the Gulph of Finland, the gov. of Wyborg, Lake Ladoga, and the gov. of Olonetz; E. and S. E. Novgorod; S. Pskof; and W. the Lake Peipus, and the gov. Revel. Area, estimated at about 15,000 sq. m. Pop., in 1846, 642,700. The country is generally flat; but in the N. and S. E. are a few undulating hills. The general slope is towards the N. W.: all the rivers, the principal of which is the Neva, flow to the Gulph of Finland, or Lake Ladoga. The soil is mostly sandy and thin; and the climate damp, severe, and unhealthy. At an average, frost prevails, more or less, for 160 days in the year. Rye, barley, oats, and some wheat are grown, but the climate is unfavourable to the culture of corn; and nearly 2-3rds of the prov. is covered with wood, marshes, and lakes. Timber, indeed, forms the chief source of what may be called wealth, deals and masts being the great articles of export, and the villagers subsisting chiefly by making wood-work of different kinds. The trade is limited, in a great measure, to the capital. The best agriculturists are German colonists, who raise flax, hemp, and, above all, kitchen vegetables, for the supply of the capital. Russians form the majority of the inhabs.; the remainder is composed of Finns, Carellians, Ijors, Germans, &c., most of whom are Lutherans. This gov. is divided into 9 districts; Petersburg, the cap., is the only place of importance.

PETERSBURG, the modern metropolis of the Russian empire, and one of the largest cities of Europe, at the E. extremity of the Gulph of Finland, where it receives the river Neva, by which the city is intersected, lat. 59° 56' 31" N., long. 30° 18½' E. Pop., circa 500,000. The city, which is of a circular form, stands partly on the main land, on the S. side of the Neva, and partly on islands formed by its branches. It owes its existence to the genius and power of Peter the Great, by whom its foundations were laid in 1703. At first all the public buildings and houses were of wood, and were huddled together without regard either to regularity or convenience. But brick and stone buildings were soon after introduced; and the streets were laid out on a regular plan, crossing each other at right angles. This was greatly facilitated by the ravages of destructive fires in 1736 and 1737, which having destroyed some thousands of the old houses, enabled government to lay down judicious regulations for their reconstruction. The empress Elizabeth did much to improve the city; but it is chiefly indebted for its regularity, beauty, and magnificence to

empress Catherine II. Under this princess principal channel of the Neva was faced by granite quays; several new streets and quays were opened; and seven of the finest public buildings and monuments were either built on an improved plan, or constructed of granite. The late and present emperors have also distinguished themselves by their efforts to improve and embellish the city. It is now certainly one of the finest in Europe, and is unequalled for the width and regularity of its streets, the length and magnificence of its quays, the elegance of its squares and public buildings.

Among the latter, which are principally situated on the quays bordering the main channel of the Neva, and in the street entitled the Nefski Prospekt, may be specified the Winter Palace, or ordinary residence of the emperor, a vast heavy building. It communicates by a gallery with the Hermitage, another palace, long the residence of Catherine II.; the latter has attached to it the court theatre, and contains a fine picture-gallery, a valuable library, and an extraordinary rich collection of engraved stones, medals, &c. There are also the Marble Palace, Palace of Anitchkoff, formerly occupied by the reigning monarch, the Taurida Palace, built by Catherine II. for her favourite Potemkin, &c.

The Admiralty, an immense brick building, occupies the centre of the city; it contains stores, docks for the construction of men-of-war, and a very extensive collection of objects connected with navigation and natural history. The signal tower of the admiralty, erected by the empress Anne in 1734, is one of the most striking objects in approaching Petersburg. Among the other public buildings are the hotel of the academy of the fine arts, accounted one of the finest in the city; the Exchange; the palace of the senate; the hotel *de l'état major*, a magnificent building; the barracks for the guards; the new theatre; the exchange bank; imperial library; military hospital; hotel of the land cadets, and many others.

The citadel, founded by Peter the Great, but since reconstructed, stands on an island in the middle of the city. It is a regular hexagon, and has a tower 360 ft. in height.

Among the churches may be specified the cathedral of our lady of Kasan, consecrated in 1811. It is built on the model of St. Peter's at Rome, and is one of the finest ornaments of the capital. The cathedral of St. Peter and St. Paul was founded by Peter the Great in 1712; it is of the same dimensions; but it derives its principal interest from its containing the tombs of all the Russian sovereigns, from its illustrious founder down to the late emperor, with the exception of Peter II., interred at Moscow. The church of the convent of St. Alexander Nefski, at the end of the magnificent street to which it has given its name, occupies the third rank among the churches of Russia. The mausoleum of the empress Anne is of solid silver; several distinguished persons are interred in the church; and there is attached to it a grammar-school on a very large scale, having generally about 800 pupils. The cathedral of St. Isaac is one of the largest and finest churches in the city. The total number of churches in 1836 amounted to 58, of which 11 belonged to the established Greek faith, 11 to Catholics and Protestants, and 4 to dissenters. There were, also, at the same epoch, 91 private chapels in private houses, and one monastery.

Petersburg contains some noble monuments: the head of these may be placed the magnifi-

cent equestrian statue of Peter the Great, by Falconet. "The monarch is represented in the attitude of mounting a precipice, the summit of which he has nearly attained. His head is uncovered, and crowned with laurel; he wears a loose vest, in the Asiatic style, with half boots, and sits on a housing of bear skin; the right hand is stretched out, as in the act of giving benediction to his people, and the left holds the reins. The design is masterly, and the attitude bold and spirited. The horse is springing upon the hind legs, and the tail, which is full and flowing, appears slightly to touch a serpent, artfully contrived to assist in supporting the vast weight. The contrast between the composure of Peter and the fire of the horse, eager to press forward, is very striking. The simplicity of the inscription corresponds to the sublimity of the design—PETRO PRIMO, CATHARINA SECUNDA, 1782." (*Coxe's Trav.*, ii. p. 112.) The pedestal on which this noble statue is erected is a gigantic rough block of granite. It was found at a distance of several miles from the capital, and its conveyance thither was a work of extraordinary difficulty.

The column erected in honour of the late emperor Alexander is one of the finest of its kind. It is 150 ft. in height; the pedestal is of granite and bronze; the shaft of the column consists of a single piece of red granite, 84 ft. in length, and 14 ft. in diameter. This, which is the largest monolith in the world, was cut from the quarries of Pyterlar, in Finland, several m. from Petersburg. The column is surmounted by a capital and a small dome in bronze, on which is placed a statue emblematical of religion.

The cottage occupied by Peter the Great during the foundation of Petersburg is still preserved, and will be regarded by most persons as the most interesting monument in the city. It is built of wood, painted in the Dutch style, and is not 20 ft. high.

Petersburg has a great variety of institutions for the promotion of education and literature. The university, founded in 1819, has already attained to considerable distinction, and had, in 1846, 700 pupils and 69 professors. The *medico-chirurgical academy*, founded by Peter the Great, and re-organised by the emperor Alexander, for the instruction of medical men, enjoys a high reputation; two hospitals, on a large scale, are attached to it; the instruction is gratuitous, and the number of pupils may amount to 520. A sum of 386,290 roubles a year is appropriated to the support of this establishment. The education is good, and the examination strict. Among the educational institutions may be specified the military schools (*see art. RUSSIA*); the theological academy; the school for training and instructing schoolmasters; the Oriental institution, founded in 1823; the school of commerce and navigation; the technological institution; the Protestant school of St. Peter, at which above 500 children of both sexes are educated; two gymnasiums or colleges; the schools of Sendluol and St. Catherine, for the instruction of nearly 700 young ladies; the military orphan school; the grammar-school of St. Alexander Nefski, already alluded to, and a number of others.

According to the official returns, the pupils at the various schools and educational institutions in the city, in 1836, amounted, in all, to 11,293. Now, if we take the stationary pop. of the city at 400,000 (*see post*), this would give the proportion of scholars to the pop. at about 1 in 32. But when every body is educated, the proportion at school cannot well be less than 1 in 10. The number of children in Petersburg is, no doubt, less in proportion to the pop. than in most other great towns; but it is, notwithstanding, sufficiently obvious that the means of elementary instruction are insufficient.

Petersburg has some noble libraries, and scientific and literary collections. The Imperial library, one of the largest and finest in the world, contains about 445,000 printed vols. and 20,000 MSS. The academy of sciences, founded by Peter the Great in 1724, has long occupied a distinguished place among such bodies. It contains a valuable library, an Asiatic museum, with cabinets of medals, natural history, &c. It is also furnished with an observatory, whence the Russian geographers reckon their first meridian. The Imperial Russian academy, the academy of fine arts, &c., are celebrated all over

Europe; and there are besides a great number of similar institutions. The botanic garden is extensive, and has a valuable collection of exotics.

The hospitals are numerous, and well endowed. The most celebrated is the foundling hospital, founded by Catherine II., and much improved and enlarged by the late benevolent empress, Maria Fædorouna. But, however well intended, it is pretty certain that this foundation has always been productive of infinitely more evil than good. The mortality used to be enormous; and, notwithstanding the improvements that have been introduced, it continues, necessarily perhaps, to be very great. From 1822 to 1831, the admissions were 39,114, and the deaths 31,779! The establishment costs about 1,000,000 roubles a year. The city hospital, and the Imperial hospital, for sick poor, are both on a large scale; there is also an institution for deaf and dumb persons, a blind asylum, &c.

The Neva is deep, rapid, and its waters as clear as crystal. The main stream, which is broader than the Thames at London, is crossed by two bridges, and its branches by three. These are all of boats, and are removed in the beginning of winter, before the river is frozen over. But there are a great number of other bridges joining the various portions of the city: some of these are of iron, some granite, others wood, &c. The granite quay, along the S. side of the Neva, is a stupendous work, above 3 m. in length. The S. side of the town is intersected by canals, of which the Fontanka is the finest.

The streets are, for the most part, paved with stone; a few, however, are still floored with logs of timber; and recently some have been macadamised. The foot pavements are generally good; but the carriage ways, in wet weather, become very dirty.

Many of the brick houses are stuccoed and painted, so as to have the appearance of stone; but the number of genuine stone houses is very limited indeed, and wooden houses still predominate. According to the official account, there were in the city, in 1836, 8,641 houses, of which 3,024 were brick and stone, and 5,617 wood. The better class of houses are covered with iron or copper, and the inferior with tiles. The principal houses have arched door-ways, under which carriages enter, and spacious court-yards, in which wood for fuel, &c., is stored up.

Owing to the barren nature of the soil round the city, most part of the provisions required for its consumption have to be brought from a great distance by canal or by sledges. An extraordinary market for butchers' meat, game, fish, &c., is held at the conclusion of the fast, ending the 28th Dec. (O. S.), at which a large proportion of the inhabs. supply themselves with provisions for the remainder of the winter. The carcasses of the vast quantities of oxen, sheep, hogs, fowls, &c., brought to this market, are all frozen; the smaller animals are piled up

in pyramids, but the larger ones, which are skinned, and set on their legs, in rows, alongside each other, have a ghastly and frightful appearance to persons not familiar with such exhibitions. They are cut in pieces with hatchets; and when carried home are preserved in snow cellars, of which each house has one. Previously to its being dressed, the frozen meat is thawed in cold water, but it loses much of its flavour, and all families of condition use fresh killed meat. The length and severity of the winter necessarily occasions a great demand for fuel. This consists partly of coal from England, but chiefly of wood; and as the neighbourhood does not afford a sufficient supply, vast quantities are brought from the interior. The barges, too, which arrive from the latter are almost all broken up, and used either as timber in the construction of houses, or as fire-wood. Flour and billet magazines have been erected by government, for the accommodation of the poor in scarce and severe seasons.

Some manufacturing establishments are carried on upon account of the crown, but the greater number belong to private individuals. Among those belonging to the crown are manufactures of gunpowder, tapestry, and porcelain, and a cannon foundry. Among the private manufactures are those of silks, cottons, sail-cloth, woollens, paper, leather, stuffs, tobacco, wax-cloth, soaps, types, &c.; there are extensive glass-works at Oserki, near the city; and there are great numbers of watch-makers and jewellers, coachmakers, mathematical and musical instrument makers, carpenters, &c.

Petersburg has the most extensive foreign trade of any city in the N. of Europe. This arises not so much from its great pop. as from its being the only great maritime inlet on the Gulph of Finland, and from its vast and various communications with the interior. By means partly of canals, but principally of rivers, Petersburg is connected with the Caspian Sea, goods being conveyed from the latter to the capital, a distance of 1,434 m., without once landing them. The iron and furs of Siberia and the teas of China are received at Petersburg in the same way; but, owing to the great distance of these countries, and the short period during which the rivers and canals are navigable, they take 3 years in their transit by water. Immense quantities of the less bulky and more valuable species of goods are also brought to the city during the winter upon the ice in sledges.

The principal article of export is tallow; and, next to it, are hemp and flax, iron, copper, grain, particularly wheat; timber, potashes, canvass and coarse linen; linseed and hempseed; linseed and hempseed oils; furs, hides, leather, bristles, fox, hare, and squirrel skins; cordage, caviare, wax, isinglass, tar, &c. The principal imports are sugar and other colonial products; cotton yarn, raw cotton, and cotton stuffs; dye stuffs, wines, silks, woollens, hardware, fine linen from Holland, Silesia, &c.; salt, lead, tin, coal, &c.

Account of the Quantities of the principal Articles exported from Petersburg in 1849, specifying the Countries to which they were exported, and the Number of Vessels that cleared out for each.

The total export of corn, and of seeds of all sorts, in 1847, amounted to the immense quantity of 2,518,897 chetverts, equivalent to 1,813,606 quarters. But though very large at all times, this exportation, owing to the scarcity that then prevailed in this and other countries, was greatly beyond the average.

This great trade is principally conducted by foreigners, especially the English. Cronstadt, 20 m. lower down the gulph, is properly the port of Petersburg. All ships drawing more than 8 or 9 ft. water stop at the former, their cargoes being conveyed to and from the city by means of lighters. Hence Cronstadt is included in the Petersburg custom-house; and vessels clear indifferently for the one or the other. The number of vessels entering the port varies from 1,000 to 1,600 a year, of which, as seen above, the English are by far the most nu-

merous. The Russians have few native ships. A commercial bank was established here in 1818. (For further details as to commerce, &c., see RUSSIA.)

In most large towns females predominate over males; but it is quite otherwise in this capital: of 451,974 individuals, composing the pop. in 1836, 230,564 were males, and only 121,410 females! This extraordinary discrepancy is accounted for, partly by the great number of soldiers in the city, very few of whom are married, partly by the great number of unmarried male domestics in great houses, and partly by the fact that the wives and families of many of the peasants are established in the districts of the country to which they belong. Deducting military and strangers, the permanent population of the city does not exceed 400,000.

Though well situated for commerce, the position of the city is, in most other respects, far from good. The ground on which it stands is low and swampy, and the surrounding country partakes of the same character, and is covered with forests. No one less bold and enterprising than Peter the Great would have dreamed of building a large city in such a situation, and no one with less gigantic means at his disposal would have been able to carry such a project into effect. But no art can ever overcome the defects inherent in its situation. The climate is severe, foggy, wet, and variable in an unusual degree. The sub-soil is so very porous and saturated with water, that it is hardly possible to excavate a cellar anywhere in the city, and there is the greatest difficulty in constructing sewers to carry off filth and other impurities. But the great drawback on Petersburg consists in its little elevation above the level of the sea and the river, and its consequent exposure to the most dreadful inundations. These are generally occasioned by a V. or S. W. wind, accumulating the water of the gulph at the mouth of the river, and preventing the free exit of the latter. The years 1736, 1752, 1777, and 1824 have been particularly distinguished by these inundations. The last of these visitations was the most appalling and destructive. The whole city was laid under water; above 8,000 individuals perished, and property to a vast amount was destroyed.

The amusements of Petersburg are modified by the religion and the climate. There are four theatres, and plays are acted in Russian, German, French, and sometimes English. The actors are all paid by government, and do not, in any degree, depend on their audiences. The *personnel* of the theatres comprises about 1,200 individuals. During winter the national amusements are ledge-driving and sliding down artificial elevations, similar to those called in Paris the *Montagnes Russes*. All classes use the vapour bath: the public and private baths in the city are estimated at about 350.

The country in the vicinity of Petersburg being flat and marshy, presents few rural beauties. The imperial family have country residences at Oranienbaum, on the gulph of Finland, Rammanoi Ostroff, Peterhof, Czarskoe, &c. Czarskoe, situated on the Neva, about 6 m. from Petersburg, is an exception to the general rule, inasmuch as it stands on an eminence rising 230 ft. above the river; Paulsk, in the vicinity of Czarskoe, is also considerably elevated.

The palace of Czarskoe is reckoned the finest summer residence belonging to the Russian monarchs. The town, though small, is handsome and improving. It has a lyceum, with 14 professors, a forest school, and is the ap. of a circ. Paulsk has also a pretty little town dependent on it. These have been, for some time past, favourite resorts of the citizens of Petersburg; and the presumption is that they will be more resorted to now than ever, a railway—the first of the kind constructed in the empire—having been opened between them and the capital. A railway, on a magnificent scale, intended to unite Petersburg and Moscow, about 430 m. in length, has, also, been commenced, and proceeded with to a considerable distance. Its completion will be of vast consequence to the empire.

We have consulted, in drawing up this article, the *Travels of Coxe*, the *Voyage de Deux Français dans le Nord de l'Europe* (an accurate and valuable work), *Norck's Picture of Petersburg*, &c.; but we are principally indebted to the excellent account of the city in Schnitzler's work *La Russie, La Pologne, &c.*, p. 187—201., and the official accounts published by the Russian government.

PETERSBURG, a town and river-port of the United States of N. America, state of Virginia, on the Appomattox, a trib. of the James River, 21 m. S. by E. Richmond; lat. 37° 14' N., long. 77° 20' W. Pop., in 1840, 11,136. The town, which was rebuilt, in 1815, after an extensive fire, is regularly laid out, and comprises many handsome houses, with churches and other public buildings, including a masonic hall. Its inhab. carry on an active trade in cotton, flour, and tobacco; and it has pretty extensive manufactures. The falls of the river, close to the town, furnish ample water-power, and it had, in 1835, three cotton-mills, six flour-mills, a brass and iron foundry, tanneries, oil-mills, &c. The river is navigable up to the town for vessels drawing 7 ft. water; but large ships unload at City Point, near the mouth of the river: agg. burden of ships belonging to the port in 1849, 2,736 tons. (*Murray's Encyc. of Geog.*, Amer. ed. iii. 525.; *Encyc. Amer.*, &c.)

PETERSFIELD, a par. bor., market-town, and par. of England, co. Southampton, and hund. Finch-dean, near the Loddon, 15 m. N.N.E. Portsmouth. Pop. of par. bor. (which includes with the old bor. the tithing of Sheet, the several pars. of Burton, Lyp, and Froxfield, 3 tithings belonging to the par. of East Meon and the par. of Steep, with the exception of 2 tithings), in 1841, 5,201; ditto, of town, 1,448. It is a small, clean, country-town, its principal street crossing the Ports-

mouth and London road, nearly at right angles. The church is a large brick structure, with a low, square tower: the living is a curacy subordinate to the rectory of Burton. The Wesleyan-Methodists and Baptists have their respective places of worship, with attached Sunday schools. The endowed charity school, called Churcher's College, was founded in 1722, and furnishes clothing and food, with general and mathematical instruction, to 10 or 12 boys. "Petersfield has but little trade, and any consequence which it possesses arises entirely from its position on the high road between London and Portsmouth," an advantage, however, which it will not enjoy after the completion of the Portsmouth branch of the South-western railway. (*Parl. Bound. Rep.*) The bor. was incorporated in the reign of Elizabeth, and is governed by a titular mayor and common council, chosen annually at the court-leet of the lord of the manor. It returned 2 mems. to the H. of C. from the reign of Edward I. down to the Reform Act, the right of election being in the freeholders in general within the bor., though, in point of fact, it has been for many years a close bor. belonging to the lord of the manor. The Reform Act deprived it of one of its mems., and the Boundary Act enlarged the electoral limits, so as to include with the old bor. the additional pars. and tithings mentioned above. Registered electors in 1849-50, 358. It is also one of the polling-places at elections for the N. div. of Hampshire. Markets on Saturday, and fortnightly cattle fairs on alternate Wednesdays; other fairs, Mar. 8., July 10., and Dec. 11., for sheep and horses.

PETERWARDEIN, or **PETER-VARA**, the cap. town of the Slavonian military frontier, and one of the strongest fortresses in the Austrian empire, on a scarped rock, on the S. bank of the Danube, opposite Neusatz, 46 m. N.W. Belgrade. Pop., with its suburbs, about 4,800, exclusive of its garrison, which is usually about 3,000 strong, though there are barracks adapted for 10,000. Peterwardein has several churches, schools, &c., and communicates with Neusatz by a bridge of boats defended by a strong *tête de pont*. It is the residence of the general commandant of the Slavonian military frontier and several subordinate military authorities. It is supposed to occupy the site of the ancient *Acuminum*, and derives its present name from Peter the Hermit, who marshalled here the soldiers of the first crusade. (*Best. Nat. Encyc.*; *Berghaus*; *Slade*; *Paget*, &c.)

PETHERTON, **NORTH**, a market-town and par. of England, co. Somerset, hund. its own name, 7½ m. N.E. Taunton. Area of par., 11,080 acres. Pop., in 1841, 3,759. The town consists of one long street, in which are many well-built houses and a spacious market-place. The principal buildings are, the par. church, a handsome edifice, a chapel-of-ease, and an endowed school for 20 boys. The inhab. are chiefly employed in retail trade and agriculture. A large corn-market was formerly held here; but it has long since declined in favour of that held at Bridgewater. Fairs, May 1. and the Monday before Nov. 12.

PETWORTH, a market-town and par. of England, rape of Arundel, co. Sussex, hund. Rotherbridge, on the Arun, 13 m. N.N.E. Chichester, and 42 m. S.W. London. Area of par., 6,140 acres: pop., in 1841, 3,364. The streets are very irregular, but there are many well-built and some handsome houses, besides a fine market and sessions-house near the centre of the town. The church, a neat stone edifice recently enlarged, has a square tower: the living is a rectory in the gift of the Earl of Egremont, the lord of the manor. The Wesleyan-Methodists and Independents have also their respective places of worship, and there are various Sunday schools and a national school. Here are almshouses, an hospital, and a house of correction on the plan of Howard. A considerable retail trade is carried on for the supply of the neighbouring gentry; but most of the inhab. are engaged in agriculture. The Epiphany and Easter quarter-sessions for the W. div. of Sussex are held here, and petty sessions on alternate Saturdays. Petworth is one of the polling-places at elections for the W. div. of the co. Markets on Saturday; fairs, Holy Thursday, July 29., and Oct. 2.

Close to the town is Petworth House, the seat of the late Earl of Egremont, which, both for the elegance of its exterior and the sumptuousness of its internal fittings, may vie with the finest mansions of the English nobility: the park, which is inclosed by a wall, 12 m. in circ., is beautifully laid out, and commands many picturesque as well as extensive views.

PEZENAS (an. *Piscenas*), a town of France, dép. Hérault, cap. cant., near the junction of the Hérault and Peine, 24 m. W.S.W. Montpellier. Pop., in 1846, 7,217. It is finely situated, and its old castle commands a magnificent prospect. Several of its streets are wide and lined with good houses. It has a handsome par. church, and had formerly many conventual churches; but one of these has been converted into a distillery, another into an hotel, and a third into a theatre! Pezenas is the seat of a tribunal and chamber of commerce, and a

comm. coll. It has manufactures of woollens, cotton stuffs and yarn, linens, &c. But it is principally celebrated for the great fair, held here in September, which is attended by dealers from all parts of the S. of France. A great deal of business is then transacted in wool, woollens, cottons, and other fabrics. (*Hugo, art. Hérault, &c.*)

PHILADELPHIA, the second city, and formerly the cap. of the U. States of N. America, state Pennsylvania, between the Delaware and Schuylkill, about 6 m. above their confluence, 80 m. S.W. New York, and 123 m. N.E. Washington; lat. (observatory) 39° 57' 9" N., long. 75° 10' 37" W. Pop. in 1850, 409,043. The city, which is about 4 m. in length N. to S., by about 2 m. in breadth, is divided into square compartments by wide and well-paved streets crossing each other at right angles. It is lighted with gas, and drained by sewers, which discharge themselves into the Delaware. It is also admirably supplied with water from the Schuylkill, by means of some very extensive dams and reservoirs erected at Fairmount, near the city, at an expense of 432,512 dollars.

"There is a great air of neatness, and of almost peculiar cleanness about the city; but the extreme regularity of the streets is tiresome. The steps of the outer stairs of a great part of the houses are of white marble, and the tops of the outer railings of brass, and both, as well as the windows, are not only cleaned every morning, but made bright with a degree of care which I never before witnessed. The streets are very generally shaded with trees — a very desirable luxury in this hot climate." (*Stuart's America*, i. 366.)

The public buildings, which are generally constructed of white marble, are among the most elegant in the U. States. The late United States Bank, built on the model of the Parthenon; the Pennsylvanian Bank; the Mint of the U. States, a handsome edifice, with Ionic porticoes, 62 ft. in length on each front; the Exchange, ornamented with Corinthian columns, and comprising a spacious hall and news-room, the post-office, &c.; the Girard Bank; Girard College, a noble structure, entirely surrounded with a colonnade of Corinthian columns; Masonic Hall, &c., are the buildings most remarkable for beauty; but the most interesting is the State-house, whence the Declaration of Independence was promulgated, on the 4th July, 1776.

There are an immense number of churches and places of public worship, including two synagogues: the U. States arsenal; the State penitentiary, on the panopticon principle; the county prison, a massive granite building, in the castellated Gothic style, with upwards of 400 cells; and the debtors' prison demand notice. The Schuylkill is here crossed by two wooden bridges, one of which has an entire length of 1,130 ft.; the other is a single arch, and probably the widest existing, its span being 324 ft.

Philadelphia is remarkable for the number and excellence of its benevolent institutions. On the bank of the Schuylkill is the alms-house, consisting of four distinct ranges of building, comprising nearly 4,000 rooms. The Pennsylvania hospital, established in 1752, is one of the first institutions of the kind in the Union. The whole extent of the buildings from E. to W. is 278 ft.; and detached from the hospital is another building of 3 stories, calculated to accommodate numerous patients. There are belonging to the hospital a valuable anatomical museum, and a library. In 1817, a handsome building was erected for the accommodation of West's painting of "Christ healing the Sick," which is a valuable source of income to the hospital. The U. States marine asylum, capable of accommodating 400 men; Wills' hospital; and the various institutions for the blind, the deaf and dumb, &c.; the Magdalen, and orphan asylums, &c., are established upon a most liberal scale. The academies and learned institutions are equally distinguished. The university of Pennsylvania, founded in 1755, occupies a large edifice originally built for the President of the U. States. It has faculties of arts, medicine, natural science, and law; with an attached junior academy and charity school. It has an excellent philosophical apparatus, and a considerable library. This university is chiefly distinguished as a medical school; in 1840 it had, in all, 555 students, of whom 444 were medical. There are here 2 other medical colleges, attended by about 200 students. The Philadelphia library, which originated with Dr. Franklin, and was incorporated in 1742, occupies an elegant edifice, in front of which is a statue of Franklin in white marble. There are belonging to it a museum, a philosophical apparatus, and the Philadelphia library and the Loganian library, which, together, have about 22,000 vols. The American philosophical Society, established here in 1769, has a library of 9,000 vols. The Philadelphia Society for promoting Agriculture was instituted in 1785, and has a small library, a cabinet of minerals, and a repository for agricultural implements. The oldest seminary in Pennsylvania is that incorporated by William Penn, under the title of Friends' Public Schools. It has considerable funds, and supports a number of schools, which give instruction in

the Latin and Greek languages, mathematics, and natural and experimental philosophy. The astronomical observatory in the city belongs to this institution; and it has an extensive philosophical apparatus. The Athenæum, incorporated in 1815, has a library of 5,000 vols., a cabinet of minerals and medals, and upon its tables are to be found the principal newspapers of the United States and Europe, and a numerous collection of American and European magazines. The Academy of Natural Sciences has a good cabinet, and a library of 5,000 vols.; the Pennsylvania Historical Society, and the Franklin Institute, have both published valuable transactions. There are several good theatres and excellent market-houses: the markets are, perhaps, the best supplied of any in the U. States.

Philadelphia is distinguished as a manufacturing city, having shot, nail, cotton, paper, rope, glass, &c., manufactures, with numerous printing-offices, marble works, tanneries, breweries, distilleries, &c.; and is inferior only to N. York, N. Orleans, and Boston in the extent of its commerce. It has the advantage of a double port: that on the Schuylkill, being the shallowest, is the grand *dépôt* for the vast quantities of coal brought from the interior; while the other, on the Delaware, having water sufficient to float the largest merchantmen close by the quays, is exclusively resorted to by the shipping engaged in foreign trade. The city communicates by numerous canals and railroads with the interior of Pennsylvania and the states bordering on the Mississippi. The value of the imports from foreign countries may be estimated at from 10 to 13 million dollars a year; but the principal business of the port is its coasting trade with New York, Baltimore, Boston, and other American cities, which she supplies with various descriptions of manufactured goods, flour, and provisions. At an average from 200,000 to 350,000 barrels of flour are annually exported from the city; and it is also a great mart for the export of beef, butter, salt, &c.

We subjoin —
An Account of the Value of the Imports into Philadelphia, and of the Duties accruing on the same in the under-mentioned Years.

Years.	Value of Imports.	Duties.
1830	\$9,525,893	\$3,537,516
1831	11,673,755	4,372,525
1832	10,018,195	3,500,292
1833	11,153,757	2,985,095
1834	10,686,078	2,110,477
1835	11,868,529	2,501,621
1836	16,116,625	3,146,458
1837	10,130,838	1,820,993
1838	10,417,815	2,109,956
1839	14,753,589	2,844,984
1840	8,621,484	1,517,206
1841	9,918,598	1,983,681

1848	179,507	15,537	140,014	207,092	817,051

The shipping, as well as the trade of Philadelphia, has increased very rapidly. During the year ended 30th June, 1849, the aggregate burden of the vessels belonging to the port amounted to 188,087 tons. In 1849, the value of the native produce exported to foreign countries amounted to 4,850,872 doll. There were, in 1850, 47 banks and 5 branches in Pennsylvania, with an agg. cap. of 17,182,174 doll. Of these, about a third belong to the city.

For municipal purposes, Philadelphia is divided into six wards, or districts, and is governed by a mayor, a recorder, 15 aldermen, and a select and common council, annually chosen by the citizens. The mayor's court has the same jurisdiction as the county courts of quarter sessions. The city sends seven representatives and two senators to the state legislature.

Philadelphia was founded by William Penn, in 1682. The first Congress of the Union was held here in 1774, and in 1776 the Declaration of Independence issued from its press. It was occupied by the British in 1777 and 1778. It continued from the last-mentioned year down to 1800, to be the cap. of the Union. (*Murray's Encycl.*)

meats are pretty generally used in husbandry. Rice is the chief support of the pop., and hence is raised in large quantities throughout the group, the marshy nature of the country in many parts being favourable to its cultivation. In other districts, however, upland rice is cultivated. The sugar-cane is raised on the great plain of Pampanga and in the island of Panay: the mode of extracting the sugar is defective, but the sugar is excellent; its culture is also rapidly extending, and it now forms by far the most important article of export from the Philippines. Tobacco grows well, and might be produced on a very extensive scale; but its growth is limited, from the manufacture of cigars, in which form alone tobacco is exported, being a government monopoly. Indigo, also, is pretty extensively cultivated, but is inferior in quality to that of Bengal. Sapan wood constitutes the chief timber of the hilly districts, and is exported in large quantities to China. The coffee-plant was introduced by the Spaniards at the close of the last century, and grows wild on the W. side of Luzon, though not in the other islands. The coffee exported from Manila is almost wholly procured from these wild plants, and is alleged to be almost equal to that of Bourbon or the Mauritius. The banana is found on nearly all the islands, and hemp is produced very abundantly in the neighbourhood of Manila, as well as in Panay and Zebu, furnishing materials both for cordage and a strong coarse cloth woven by the Malays. (*Meyen*, ii. 279.) Excellent sago grows in most parts of Luzon, and the cocoa-nut, which was introduced from Guatimala, is very abundant, and superior in quality even to that of Peru. The shrub-cotton (*gossypium herbaceum*) thrives well; but, owing to some imperfection in the mode of breaking the pod, the cotton is of inferior quality, and little is exported. Cinnamon, the betel-pepper, and the clove-tree are found wild in many of the islands, and the bread-fruit, mango, and shaddock are raised very abundantly and with little labour. The other fruit-trees are few in number and of very indifferent quality. The mountains produce excellent timber for building both houses and ships; and the bamboos, used in the construction of the houses of the Malays, are very long, some being as thick as a man's thigh. The fauna of the Philippines comprises buffaloes of uncommon size and strength, a small, but hardy, breed of horses, introduced by the Spaniards, goats, pigs, and a few sheep, with immense numbers of ducks and fowls both wild and domestic. Land-tortoises are plentiful in most of the islands, and their shells constitute an important article among the exports. There are no beasts of prey; but caymans are found in most of the rivers and lakes, and are particularly numerous in the Laguna de Bahía. Among the birds may be noticed the swallows which supply the edible nests. Fish abound on the coasts, and the native fishermen are equally expert with the other islanders of the E. Archipelago. Pearl-oysters also are found in large quantities, and the shells are exported to China. The sea-slug, or *holothuria*, is also an important article of commerce.

Manufactures are of very little importance. The plaiting of straw and chips of wood into hats, cigar-cases and matting is carried on pretty extensively, and the hats are highly prized by the Spaniards. Domestic weaving occupies most of the females; and cotton cloth was till recently an article of export to Mexico. Considerable quantities of earthenware are made in Luzon, but of very inferior quality to that of China. The manufacture of cigars is a government monopoly; and, according to *Meyen*, ii. 211., the royal manufactory at Manila employs about 2,000 persons, two-thirds of whom are females.

Commerce.—Considering the great fertility and varied productions of the Philippines, and their peculiarly favourable situation for carrying on commerce, the limited extent of their trade, even with its late increase, may excite surprise. This, however, is entirely a consequence of the wretched policy of the Spanish government, which persevered until very recently in excluding all foreign ships from the ports of the Philippines, confining the trade between them and Mexico and South America to a single ship! Even ships and settlers from China were excluded. "Provisions," says La Pérouse, "of all kinds are in the greatest abundance here, and extremely cheap; but clothing, European hardware, and furniture, bear an excessively high price. The want of competition, together with prohibitions and restraints of every kind laid on commerce, render the productions and merchandise of India and China at least as dear as Europe!" Happily, however, this miserable policy, the effects of which have been admirably depicted by M. de la Pérouse, has been materially modified within the last few years. The events of the late war destroyed for ever the old colonial system of Spain; and the ships of all nations are now freely admitted into Manila and the other ports in the Philippines. An unprecedented stimulus has, in consequence, been given to all sorts of industry; and its progress will, no doubt, become more rapid, according as a wider experience and acquaintance with foreigners makes the

natives better aware of the advantages of commerce and industry, and disabuses them of the prejudices of which they have been so long the slaves.

In 1837, among other articles exported from Manila, were 222,183 piculs (about 13,250 tons) sugar; 59,457 pic. hemp; 126,003 coyangs rice; 4,598 boxes cigars, with considerable quantities of indigo, hempen cloth, sapan wood, and a great number of other articles; the total value of the exports amounting in the course of that year to above two million dollars. Cotton manufactured goods constitute the great article of import. The foreign trade of the islands centres almost entirely in Manila, which see. It is, in fact, the only port in the Philippines to which either Spanish ships to or from Europe and foreign vessels generally are allowed to trade; but Spanish vessels trading with China and Singapore, may proceed to the outports of Pangasinan, Ylvers, and other places, to take on board their outward-bound cargoes. (*See MANILLA*.)

The population of the Philippines is extremely various; and, independently of foreign settlers, the natives consist of a great number of distinct tribes, partly of Malay, partly of Papuan origin, and speaking several distinct languages or dialects. Some of the natives still adhere to the polytheism they professed before the arrival of the Spaniards; but a large proportion have been converted to the Catholic faith, which, indeed, is the common bond between them and their new masters and the principal means by which the latter have so long been able to maintain their ascendancy. The natives are said to be the most active, bold, and energetic of any belonging to the E. Archipelago. "These people," says M. de la Pérouse, "appear in no respect inferior to those of Europe. They cultivate the earth like men of understanding; are carpenters, joiners, smiths, goldsmiths, weavers, masons, &c. I have walked through their villages, and found them kind, hospitable, and communicative; and though the Spaniards speak of them and treat them with contempt, I perceived that the vices with which they are charged, ought rather to be imputed to the colonial government." (*Voyage*, chap. 15.) The people here described, however, are the Malays, who have pretty generally acknowledged the supremacy of the Spaniards, by whom they are treated as free subjects, and allowed to be proprietors of land; the Papuans, who chiefly occupy the higher parts of the country and less frequented islands, are miserable savages, incapable of civilisation, and avoiding all communication with foreigners. The rest of the population comprises European and Creole Spaniards, Spanish and Indian mestizos, Mohammedans from the E. Indies, and Chinese. The Spaniards, however, do not, perhaps, exceed 4,000 or 5,000.

The seat of government is at Manila, the residence of the captain-general of the Philippines; but there are lieutenant-governors in the most important of the other islands, and alcaldes in each of the provs., which also are subdivided into *pueblos*, having their separate intendants. The revenues of the Philippines are principally derived from *ad valorem* duties on imports and exports, and from a capitation tax, and the tobacco monopoly. Foreign commodities, imported in foreign vessels, pay 14 per cent., and in national vessels from 7 to 9 per cent.; but there are some exceptions, and wines of all sorts, except Champagne, pay from 40 to 50 per cent., according as they are brought in native or foreign bottoms. Spanish products, imported by Spanish vessels, pay 3, and, by foreign vessels, 8 per cent. Exports (in which are comprised commodities produced in the island, and imports from foreign countries for consumption) pay from 1 to 1½ per cent. *ad valorem*, by Spanish, but from 2 to 3 by foreign ships. Tobacco, however, and hempen rope, made at Manila, may be exported free of duty. Spaniards may export rice free of duty; but foreigners are charged 4½ per cent. The capitation tax, or annual tribute, is charged at certain rates on all the inhabs. except European mestizos. The Chinese, who constitute the chief portion of the shopkeepers, traders, mechanics, coolies, and household servants are divided into four classes, paying rates, varying from 12 doll. 6 rs. to 120 doll. 6 rs., to which they are subject from the age of 16 to 60; but no Chinese is allowed to settle on the islands after the age of 40 years. Chinese and Indian mestizos pay 1 doll. 3 rs. annually, from the time of puberty till death, and Indians of both sexes pay 5 rs. 6 gr. each, during the same period. The number of tribute payers amounted, in 1837, to 1,305,142, of whom 901,924 belonged to the 17 provs. comprised in the island of Luzon. The army consists of about 7,000 men, of whom only 700 are Spaniards, and the rest Malays. The cavalry are chiefly European; but the Malays are said to be good soldiers, and occupy most of the fortresses in Luzon.

The Philippines were discovered by Magellan in 1521, but were not claimed by the Spanish till 1565, soon after which Manila was constituted the cap. of their posses-

in relief by John of Bologna, and many fine paintings and bas-reliefs by some of the first Italian masters. But incongruities are numerous: "The marble pulpit is supported by a naked figure of most gross design; Bacchante and Meleager's hunt are encrusted on the walls; an ancient statue of Mars is worshipped under the name of St. Potitus; and the heads of satyrs are carved on a cardinal's tomb!" (*Forsyth*.) Among the 80 other churches are many which can boast of rare works of art. The baptistery, opposite the cathedral, was built between 1162 and 1154, when Pisa was so populous and rich, that a voluntary contribution of one florin from each family is said to have sufficed to pay for its erection. This building is an immense polygon, above 160 feet in diameter and 176 in height, surmounted by a cupola and a cone terminated by a figure of St. John the Baptist. Nearly the whole of the exterior is of marble, and the interior is handsome; but, according to Mr. Woods, the building wants finish, and is not altogether well proportioned. The famous *Campanile*, or Leaning Tower, is an edifice of little actual beauty, but rendered extraordinary by its inclination from the perpendicular. It was begun about 1174, but not finished till the middle of the 14th century: it consists of 2 concentric walls, each 2 ft. thick, the diameter of the circular well in the centre being 22 ft.: it is 8 stories, or 190 ft., in height, with outside galleries projecting 7 ft. The topmost story overhangs the base on one side about 15 ft.; and to a spectator looking down from the top, the effect is terrific; though, as the centre of gravity is still 10 ft. within the base, it is perfectly safe. The view from the summit is alike extensive and beautiful. It has been supposed by some that the inclination is not accidental, but intentional, and that it was so constructed originally; but the more probable opinion seems to be, that it is a consequence of the sinking of the foundation. The observatory and baptistery have also a slight inclination, which is, no doubt, owing to the same cause.

The *campo santo*, or cemetery, is the most beautiful edifice at Pisa, and unique in its kind. It is an oblong or rhomboidal court, 383 ft. in length, by 127 ft. in breadth, surrounded by arcades of white marble, adorned with ancient Etruscan, Greek, and Roman bas-reliefs, busts, and other sculptures; and the walls covered with fresco-paintings, &c. by the earliest Italian masters. In its centre is an enormous mound of earth, said to have been brought thither from Palestine during the crusades, and formerly used as a burial ground. Pisa has a grand ducal residence, and several other palaces, which, with the nobility's club-house and bank, are fine buildings: the 3 bridges are handsome; and the hospitals, theatre, modern aqueduct 4 m. in length, &c., are well adapted to their purposes. Various remains of antiquity exist, as those of the aqueduct of Caldaroli, of the *Hypocaustum*, &c., supposed to have been constructed by Nero, but especially a *sudatorium*, or vapour-bath, near the Lucca gate. About 3½ m. distant, on the Lucca road, are the *Bagni de Pisa*, supposed to be the baths mentioned by Strabo and Pliny, and still frequented by numerous visitors.

Pisa has a university, formerly among the most celebrated in Italy, and remarkable for its tolerance; its degrees, except in divinity and canon law, being attainable by persons of all creeds. It is still the head university of Tuscany; and, in 1836, had 545 students, 255 in jurisprudence, 173 in medicine and surgery, 39 in physical and mathematical sciences, and 26 in theology. Its library comprises 55,000 vols.; and attached to it are the Ferdinand College, a fine botanic garden, cabinet of natural history, chemical laboratory, and observatory. This university was one of the first to revive the study of the civil law; though there be no good foundation for the common story that this revival was a consequence of the Pisans having found a copy of the Pandects among the spoils of Amalfi, sacked by them in 1140. The university has had many illustrious names in the roll of her professors, including, among others, Galileo, Torricelli, Redi, Malpighi, Thomas Dempster, Borelli, Castelli, Gronovius, &c. Besides the university, Pisa has an episcopal seminary, with about 80 students, several conventual female schools, normal and Lancasterian schools, &c.; and is an archbishop's see. Its manufactures, which are unimportant, consist chiefly of soap, white lead, vitriol, glass, and a few other articles; and its trade has sunk in proportion to the rise of that of Leghorn. The city is connected by navigable canals both with Leghorn and the Serchio; but it is a curious fact that no vestige can now be found of its ancient port or roadstead at the mouth of the river, though, in the 13th century, it accommodated large fleets. This singular result is supposed to have been brought about by a change in the course and embouchure of the Arno.

Pisa derives some advantage from its being the winter resort of the grand duke and of the Tuscan court, as well as of numerous invalids, attracted thither by the mildness of the climate. On the shore near the city, amidst an extensive forest of islex, is a farm belonging to the grand duke, where a number of camels

have been reared, it is said, from the time of the crusades; and whence most of the zoological collections in Europe are supplied with these animals.

Morals seem to be at a lower ebb in this, than even in most other Italian cities. According to Simond, idleness, ignorance, and profligacy, form the general character of the inhab. Every day one hears disgusting stories of meanness and dirty artifice in every transaction of life. Foreigners cannot hire a house, or make a bargain of any sort, without being cheated. Most of the ladies have their *cavaliere serventi*.

Most writers attribute the foundation of this city to colonists from Pisa in the Peloponnesus soon after the Trojan war.

"——— Alphen ab origine Pise
Urbs Etrusca solo." *Æneid*, lib. x. v. 179.

It became a Roman colony, and its port was, in the time of Strabo, an important naval station. It did not, however, attain to any great distinction till the 10th century, when it took the lead among the commercial republics of Italy. In the 11th century, its fleet of galleys maintained a superiority in the Mediterranean, commanding the coasts of Sicily, Sardinia, Corsica, and Barbary, and assisting the French in the crusades. But in the 12th century, a struggle commenced with Genoa, which, after many vicissitudes, ended in the total ruin of the Pisans. The latter were defeated near the island of Meloria, in 1284, in a great naval engagement by the Genoese, with the loss of the greater part of their fleet, and above 16,000 men killed and taken prisoners. Pisa subsequently became the prey of various petty tyrants, and was finally united to Florence in 1406.

Galileo, so celebrated for his discoveries in astronomy and natural philosophy, and for the persecution to which they exposed him, was a native of Pisa. He was born here on the 15th February, 1564. (*Eustace*, lib. 440—461.; *Wood's Letters of an Architect*, li. 393—398.; *Matthews & Williams*; *Forsyth*; *Conder's Italy*, lib. 1—20.)

PISTOJA (an. *Pistoria*), a city of Central Italy, grand duchy of Tuscany, prov. Florence, on the Ombrone, a tributary of the Arno, at the foot of the Apennines, 20 m. N.W. Florence. Pop. in 1845, 12,387. It is between 2 and 3 m. in circuit; is surrounded by old walls said to have been originally constructed by Desiderius, the last of the Lombard kings, and is further defended by a citadel built in 1252. It is clean, handsome, and well built, with unusually broad streets, and many curious and splendid edifices; but, like many other Italian towns, is dull, monotonous, and silent. Its cathedral is in the same style of architecture as that of Pisa and that of Lucca, but inferior to either; it has, however, some interesting monuments. The baptistery, constructed by Andrea Pisano, in 1337, is a small and handsome octagonal Gothic edifice. Several of the inferior churches are remarkable for their style of architecture or works of art; and the court-house is a fine old building. Instead of the suppressed Jesuits' college, there is a seminary for priests; and a large hospital is kept in good order.

Pistoja has a well-supplied market, a museum, two small public libraries, a large theatre, assembly rooms, and a race-ground. Provisions are cheap and good; the climate is cool and healthy; and the city is the residence of many noble and respectable families. The manufactures, which are on a small scale, include silk twist, straw hats, paper, musket barrels, cutlery, nails, iron wire, &c.; and near the city are some tolerably extensive iron-works.

Pistoja is with Prato a bishop's see, and has an episcopal college, a superior private lyceum, with normal, girls', Lancasterian, and various inferior schools. In the middle ages it was the cap. of a republic, which became subject to Florence about the same time with Pisa. (*Rampoldi*; *Bourring's Report*; *Conder's Italy*.)

PITCAIRN'S ISLAND. See POLYNESIA.

PITTENWEEM, a royal and parl. bor. and seaport of Scotland, co. Fife, on the N. shores of the Frith of Forth, 26½ m. N.E. by N. Edinburgh. Pop. in 1841, 1,309. It was created a bor. in 1837, and bears the marks of antiquity and decay. In addition to the parish church, the Episcopalian and the Relief Synod have each a chapel. Pittenweem has a small harbour; but the only business connected with it is that of fishing to a limited extent. Here are the remains of a monastery of Augustine Friars. Dr. Douglas, Bishop of Salisbury,

"The scourge of impostors, the terror of quacks,"

was born here in 1721.

Pittenweem unites with St. Andrew's, the two Anstruthers, Crail, Cupar, and Kilrenny, in sending 1 mem. to the H. of C. Registered electors in this bor. in 1849-50, 44. Corporation revenue, 1848-9, 669*l*. Number of councillors, 24.

PITTSBURG, a city of the U. States of N. America, state Pennsylvania, whose extensive iron-works have made it be called the Birmingham of America, on

PLASENCIA.

a triangular piece of land between the Allegheny and Monongahela, where these rivers meet to form the Ohio, 254 m. W by N Philadelphia, and 250 m. N E Cincinnati. Pop. of Pittsburgh proper, in 1840, 31,394; but if we include the town of Allegheny, N. of the river of that name, the rising bor. of Birmingham, S. of the Monongahela, and other suburbs, the pop. in 1850 probably exceeds 60,000. The city is of a triangular shape, compactly and in some parts handsomely built, though the streets of the different wards has given to the houses a darkened and rather gloomy appearance. Water is supplied from the Allegheny by means of a powerful steam-engine. The public buildings include numerous churches, an exchange, mansion-house, state penitentiary, different banking establishments, the western university of Pennsylvania, the Allegheny Arsenal, (occupying, with its magazines, barracks, &c., an area of 51 acres,) and buildings belonging to the Pittsburgh high school, two theological academies, and a public library.

Pittsburg is admirably situated for manufactures and commerce. It has an all but unlimited command of inland navigation, and is connected not only with New Orleans and the various ports on the Mississippi, and its tributary streams, but also, by means of canals and railways, with the Great Lakes, and with Philadelphia, and other parts on the E coast of the Union. (See PENNSYLVANIA.) And in addition to its advantageous geographical position, it has the command of the most abundant supplies of coal and iron. In consequence it has become a principal seat of American manufactures, especially of those of hardware and glass. There were, in 1840, 11 rolling mills in Pittsburg, with a great many foundries, consuming about 7,500 tons a year of pig iron produced in the vicinity. Here, also, are very extensive glass works, with works for the production of steam-engines and other descriptions of machinery, cotton factories, nail works, earthenware works, &c. Though Pittsburg lies above 1,000 m. from the sea, ship-building, especially of steamers for the navigation of the Ohio, Mississippi, and their connected streams, is carried on upon a very large scale; and most art of the machinery used in the steamers built at New Orleans, and other parts in the valley of the Mississippi, is produced here. It may, also, be truly affirmed, that, notwithstanding their rapid increase, the manufactures and commerce of Pittsburg are yet only in their infancy, and that they must necessarily continue to increase with the increasing wealth and population of the vast countries of which this is a principal workshop and emporium. In 1838, the aggregate burden of the steamers, belonging to Pittsburg, amounted to 11,355 tons, but such has been the increase in the interval that it amounted on the 30th inst. (1840) to 25,771 tons, and this despite the competition of Cincinnati, and other places on the Ohio. The ships, who are a mixture of all nations, Germans, rich, English, Scotch, French, &c., are industrious, vigilant, economical, and without show. But here, as elsewhere, the American spirit of enterprise predominates. Pittsburg derives its name from Fort Pitt, a fortress constructed on the site of the city by the British previously to 1760, and round which a town began, in the course of time, to grow up. But it did not make much progress till 1794, since which it has steadily and rapidly increased in industry, wealth, and population. In 1794, British and Colonial forces, under General Braddock, staked a total defeat on the ground now occupied by the city. (Murray's American, &c. &c. &c.; Murray's &c. of Geog. Amer. ed. 31. 511.) *Ameg. Amer.* (Q. of America, &c.)

PLASENCIA, a fortified town, on a peninsula almost E. of the Tagus (crossed by E. Badajoz, and 120 m. N. of Lisbon, 6,787. N. and S. by high mountains, covered by six gds. level, and well-wooded at intervals, an episcopal pal. and of 60 arches, which is a private collection of antiquities. The cathedral, modern Gothic structure, is not completed. The episcopal mansion a bishop, 9 dignitaries, and 24 canons. Manufactures comprise leather, hats, woollen, linen, &c. &c. &c. and the surrounding plain, or pampa, extremely fertile, producing large quantities of grain, its, oil, &c.

Plasencia, though not the *Andalucía* of the Romans, is said, by the numerous antiquities found in it, to be of ante origin. The present city, however, was built at the end of the 12th century, by Alfonso IX. of Castile. It was formerly possessed by its own lords, I gave title to a duchy; but, in 1640, it was united to the crown of Castile. (*Dictionnaire de Trévoux*, p. 333. *Mont. de*.)

PLASSEY, a village of Bengal, on the Hooghly river, 11 N. Calcutta, and 30 m. S. Murshidabad. This age will be ever memorable in Indian history, for its being the scene of the great victory gained by

PLATA, LA, (REPUBLIC OF). 519

Lord (then Colonel) Clive, on the 23d of June, 1757, over Suraja Dowra, commander of Bengal. Clive's army consisted of only 300 Europeans, 2,100 Sepoys, and 100 Topas; yet, with this small force, he did not hesitate to attack the commander's army, of 30,000 foot, and 18,000 horses, supported by a formidable train of artillery! This, however, was not so Quixotic a proceeding as it may at first appear.

Clive knew that the native troops were not so brave as their general, and, in fact, they were not.

The result of this contest threw the empire of the English, and laid the empire of India. (*War's Justice*, III.)

PUBLIC OF), or ARGENTINE REPUBLIC, a vast and fertile country, extending between the 23d and 41st degs. of S. lat. and the 54th and 73d of W. long., having N. Bolivia; E. Paraguay, Brazil, and the Banda Oriental, from all which it is separated by the Paraguay, Paraná, and Uruguay rivers; S. the Atlantic Ocean and Patagonia; and W. Chili and Bolivia. Sir Woodhouse Parish gives the following estimate of the area, population, and subdivisions of this territory:—

It is estimated, however, as the pop. of the city of Buenos Ayres may itself be estimated at about 100,000, we are inclined to think that this estimate is under the mark, and that the pop. may be set down at about a million. It has sometimes, indeed, been estimated at two millions and upwards; but there can be no doubt that this is very far beyond the mark. The Indians, who are not included in any of the above estimates, are, probably, under 50,000.

On the W. this territory is bounded by the great Cordillera of the Andes; and the N.W. prov. of Salta is almost wholly mountainous, as are extensive portions of the adjacent provs. of Catamarca and Tucuman. Some points of the Despeñado chain in Salta rise probably to the height of 15,000 ft., and in Cordoba are isolated chains, which may have been in the neighbourhood of the Andes would be called mountains. Still, however, after allowing for these and other deductions, five sixths of the country consist of plains, several of which are of vast extent. But notwithstanding its freedom from mountains, and the number and magnitude of its rivers, it is far from being the fertile region that is so generally supposed, and a large proportion of its surface is, in fact, condemned to perpetual sterility. In the N. is the S. portion of the immense tract known by the name of the Gran Chaco, a vast plain, occupying the whole triangular space between Bolivia on the N. and the great rivers Paraguay on the E., and Salado on the W. This immense plain, which probably covers from 110,000 to 120,000 sq. m., is but little known; in the N. it is covered with extensive forests, but its more S. portions, between the Vermeja and Salado, is, to fact, a sandy, arid, and uninhabitable desert. This, also, is the character of the extensive tract between the Salado and the Rio Dulce, and W. from the latter, as far as the Sierra Velasco, in about the 60th deg. of W. long., extends the great Salt Desert of Salinas, in great part covered with saline effluence, and extremely hot. The great southern plain, or that which extends over the whole country S. of the 32d deg. of lat., is, fortunately, of a very different character from those previously noticed. This vast tract, which includes an area of above 300,000 sq. m., is called the Pampas. It may, taking its vast size into account, be regarded almost as a dead level, its slope towards the E. being gradual and imperceptible. It is interspersed with innumerable lakes; but these, as well as most of the rivers by which they are fed are brackish, the soil through which they flow being strongly impregnated with salt. Perfectly fresh and potable water is, however, found at the depth of from 30 to 60 ft. Substantially, however, the Pampas are divided into several regions, differing in climate and produce, though under the same lat. On leaving Buenos Ayres, the first of these regions is covered for 120 m. with clover and thistles alternately; the 2d region, which extends for 400 m., produces long grass; and the 3d, which reaches the base

the, sugar cane, coffee, and many other articles of primary importance to the markets of Europe, may be produced in almost any season, and a large amount of country is especially well adapted to the culture of wheat, maize and other grains. Wheat, wheat (10 of tons, per acre cultivated, has now become an article of export. But the implements and processes of agriculture are still in the infantile condition. In many towns of the interior a mission wharfhouse is as yet unknown of. While in the capital itself the first pump ever seen in a private house was put up a very few years ago by an Englishman. (Parish's Buenos Ayres, p. 337)

The numerous large families domiciled by the Plata, are chiefly of a date of origin slight. It is said to have resulted from the culture of wheat as a chief occupation. The title of *criollo*, a descendant of La Plata, are principally employed in the culture of the cane, and make annually from 5,000 to 10,000 small barrels of a strong sweet wine, which is sent to Europe and the neighboring provinces. A good deal of spring and fall loaded wine and brandy is also sent from Mendoza to Buenos Ayres.

The demand for sugar in the inland provinces is not sufficient to induce the country people to devote much to the cane, but where it is pretty largely cultivated, and finds a ready sale in Tucuman and in adjacent parts. It is, however, supplied all the surrounding canons with articles of a superior quality for their domestic consumption, and exports large quantities of red sugar to Buenos Ayres. The culture, which finds the warmest market, grows in Santiago, Bahia, and elsewhere in the W. and to an enormous extent. And from the best estates grow from 5,000 to 10,000 lbs. a year of sugar, which were formerly sent to Lima and Peru. These are equally abundant, and from their improved state the Indians of the Chaco make cane sugar, having time and a variety of bags and powders for which there is always a demand among those more civilized neighbours. These articles are dyed to imitate Europe, prepared by the Indians from native plants. The same plant *Euphorbia peruviana* which when mixed with lime forms a stimulant rhubarb by the Peruvians, as the root in S. Asia grows plentifully in Bahia. Scattered about it are species of malice in 1-2 inches higher to indigenous in several places, and on one species of which a small insect makes the root with its head, which affords a most beautiful green dye. The S. Banks of the Andes and the banks of the S. affluents of the Paraguay are covered with dense forests which are, however, for the most part, almost bare of all great a distance from the Plata and the parts of the republic. The trees are mostly of the common family, and from the trunk of the algarrobo, mixed with some the Indians make cotton, and by fermentation produce their wine, a strong intoxicating spirit in very general use. The pumpkins or *Purpurea* tree has various guinea and the golden color or Paraguay tree, are cultivated in Bahia de. If you compare pasture, tobacco, cotton, and other fruits have been introduced by the Europeans and flourish with great luxuriance in spite of the natural and S. prove the best of any thing, for the most part the very great drawback to the development of the real natural resources of the country.

But the chief source of wealth to the immense herds of horses which wander over the widely extended plains of the Paraguay. Formerly the greater number of these were unmanageable, and the herd they ranged over and were hunted and destroyed at pleasure by their riders or by, though sometimes, also, for their flesh and sometimes for their hides only, the rest of the herd being left to waste and breed of prey. But the Paraguay are no longer unmanageable, a large part has been carefully tamed by the government officers, and gifted to individuals, the select and best of them of which specimens or others are kept in captivity. Every animal a year old is branded with the mark of the owner, and that mark being registered by the authorities, enables him to claim his property whenever found. According to Dr. W. Parish, it has been estimated that in the single province of Buenos Ayres there are from 3 to 4 millions head of cattle and above number of horses in the other provinces. The number most suitable to commerce or husbandry of thousands have, in some instances, suffered through neglect and drought without actually affecting the supply for the market. But all cattle, either of the number of cattle in those provinces are purely unimproved and confined in little weight, though we decline to think that Dr. W. Parish has much under rated the numbers of cattle in the provinces other than Buenos Ayres. In Santa Fe, where the revolution, an estate of 3 leagues in length by 1/2 in breadth, that is, of 1 1/2 leagues might have had upon it generally about 5,000 head of horned cattle and 15,000 horses. The price of it with such be might be—the market

might be 10 each = 5000. The horses of the same = 1000, and horses 1000 each. Therefore of stock and horses, 1,500,000, leaving the cattle of 500,000 as a bonus to the Paraguay. (Robinson's Letters on Paraguay, p. 338, 339.)

Cattle-raiding parties are frequently of war like, and Carabali, probably the largest manufacturer of La Plata is said by Dr. Robinson to have been the proprietor of 5000 or upwards of territory and the 100 head of horned cattle and 100,000 horses and mules. The animal husbandry upon a well regulated scale is carried from 10 to 20 per cent, which yields an enormous profit to the proprietor. These expenses are comparatively trifling. And since the revolution which has thrown upon the scale of S. America, the cattle which were previously not worth more than 10 or 15 a head are now worth 20 and for those like the horse can very double the quantity both of maintenance and interest. The very commonness of cattle always compared which he could procure for them. The commerce of Bahia is more largely among the richest in the country, and furnished by the the greater part of the 10,000 mules yearly sent to Bahia for the service of Peru, but the commerce of the trade with the lower country and Paraguay, and the attacks of the Indians have impoverished and depopulated that province almost to the same degree. The cattle were remarkably good when two or three years old to a perfect fat state, but to which the purchases from Peru required and brought them in droves at the rate of from 14 to 16 dollars each. The struggle for independence stopped the traffic by Peru being in the way in the possession of the republic, all intercourse with Bahia was long cut off, and not having been removed to any great extent, the breeding of cattle has declined considerably in La Plata.

The herds of the Paraguay are strictly to the common Spanish breed, and of all colors, and the cattle, the original stock was introduced from Europe. They consider with in domestic breeds being sought to be introduced by the government, whereas they are required. Though as necessary to the people as to the Arab, the former being so dear to the nation being raised without any attention on his part, even very rich he has known he sends it to the most successful manner and when it drops with fatigue he has known him and presents another animal, the exhausted horse to the wild savages. Horses are better treated by the Spaniards, but among the Indians more than that to the ordinary animal food. It may be supposed that cattle is sufficient very abundant in this country, even to an old royal officer who admits were bringing to drive sheep after the the herd of the first lot. The most able a few years ago was hardly a with the reputation of raising, but it has lately much improved in quality, and the export of the article which is still, perhaps only 10 cts the average in 1837 to 2,000 lbs. the full average the weight of sheep, like that of goats and pigs is very inferior. The average animal the region, which furnishes the other kinds is calculated by the value of cattle is abundant in Buenos Ayres, as sheep forming a principal article of export, the difficulty the shepherds in various districts. Along the Andes are found guanaco, llama, vicuña, &c. Wild horses, deer, wild jaguars, panthers, armadillo, &c. are also met with. The llaneros, a robust race of men who make travelling over the Paraguay dangerous from its numerous savages is very abundant, and condors, vultures, and numerous birds of rare plumage, inhabit the country. Its greatest pests are glass and insects, locusts, large, swarms, and other kind of vermin.

The people of native parts, are the descendants of European colonies, and many of them have sprung from the best families of Spain. They are as much the most active and the most industrious of human beings, being, when not as heretofore, when they generally are in the lowest manner in most parts. They are without agriculture, cultivating almost wholly on the bank of each and some of various kinds, which they raise by means of two different systems to the use of which they are extremely desirous to come and the best. The largest and by most systems of La Plata

is that of green beds about 100 ft long and 10 ft wide, being laid by the pole on a. The plants, when about 6 inches high a portion of the is laid, binding the rest of left hand, and when very green part of its root, then or more till to nearly completely dry over the middle of one as the other has nearly

completely turned no more sticks are to be put in a position to enable immediately the pole on the entangled entanglement. The directly extends to the operation, and the contrary with which an animal can

* In the the thought of this it is an estimate that there is 10 to 15 millions of cattle and the number of the sheep and mules in the year of Buenos Ayres was very large upwards of 100,000,000. (Parish's Buenos Ayres, p. 337.)

ning at full speed, is caught, are very striking. The *bolos*, used also by the Indians, is briefly described in the art. PATAGONIA, in this vol.

The Indians are of Araucanian origin (*see CHILI*, Vol. I. p. 592.), living, like the gauchos, chiefly on horse-back, but partly in movable tents made of hides. To their main food, the flesh of mares and colts, if they add any thing it is maize, obtained from the Spaniards in exchange for salt, cattle, and blankets, made by their women. They live together in different tribes, each governed by a cacique. Some are friendly to the whites, but the greater part are bitterly hostile; and the two races maintain against each other an exterminating warfare. A few Indians in the provs. of Salta, &c., are employed by the whites in agriculture; receiving in payment for their services some coarse woollen cloths, beads, baubles, and a few other articles of dress; but, in general, the independent tribes wearing only a *poncho*, or short cloak, boots of colt-skin, and other articles of domestic manufacture, place little value on European goods. Numerous settlements were made in the 16th century by the Jesuits in the Misiones, S.E. of Corrientes, and civilisation is said to have made some progress among the Indians of this quarter; but after the expulsion of the Jesuits, in 1767, they speedily lapsed into their previous barbarism.

La Plata has scarcely any manufactures. Ponchos, saddle-cloths, blankets, &c., are made by the Indian women, and sold in great numbers to the people of Tucuman and Salta. Cordova is the principal manufacturing town; but the above kind of goods and morocco leather, with wooden bowls and dishes, comprise almost all the articles made there. The foreign imports consist principally of European goods for the white colonists; mostly from Great Britain. "The gaucho is everywhere clothed in British manufactures. Take his whole equipment—examine every thing about him—and what is there (not of raw hide) that is not British? If his wife has a gown, ten to one, it is made at Manchester; the camp-kettle in which he cooks his food, the earthenware he eats from, the knife, spurs, bit, are all imported from England." (*Parish*, 338.) The foreign trade of the republic is increasing; but, as it wholly centres in Buenos Ayres, the reader is referred for an account of it to the article on that city in this Dict., I. 483, 484.

Education, as may be supposed, is not very flourishing in the provinces; but in the chief towns it is not, upon the whole, so backward as in some other parts of S. America. Cordova has a university, and Buenos Ayres a good public library. Newspapers are published in several towns, and the press is quite free.

The Government is nominally a representative republic or confederation, each of the provinces being, to a certain degree, independent of the rest, as in the U. States, Mexico, &c. But, in 1835, General Rosas, who was unanimously called to the presidency, refused to act, unless invested for a period with extraordinary powers. These were accordingly granted him, so that at present the government is a nearly absolute dictatorship, presenting, however, a favourable contrast to the dictatorship in the neighbouring state of Paraguay. There is a *junta* or parliament of 44 deputies, half annually renewed by popular election; and a senate of 2 deputies from each province. The provincial government consists of a popular assembly, which nominates the governor. But though democratic in theory, they are quite otherwise in practice; the lower classes bowing with obsequious deference to the nominees of the upper: and "if any appeal to the people be ever made by the latter, it is generally from the necessity of supporting by a demonstration of brute force the pretensions of some particular candidate."

The powers of the president are constitutionally very extensive: he appoints to all civil, military, and judicial offices; but he, as well as his ministers, is responsible for every new measure, and liable to impeachment before the Senate and House of Representatives. The military force is of uncertain amount; but, during the late war with Brazil, about 10,000 troops were collected, besides a numerous militia. The prov. of Buenos Ayres alone supports the government expenditure; the other provinces contributing nothing to the general expenses of the Confederation. The public revenue was estimated, in 1837, at 12,000,000 dollars, a sum insufficient to meet the ordinary expenditure. The public debt, at the same period, amounted to 35,917,166 dollars, bearing 6 per cent. interest.

This country was first discovered in 1517, and settled by the Spaniards in 1553. It was long dependent on Peru; but, in 1778, was erected into a viceroyalty, comprising, together with La Plata, Bolivia, Paraguay, and Uruguay. The English made an unsuccessful attempt on this country in 1807. In 1810, the struggle began between the inhabs. of Buenos Ayres and Spain, which terminated, in 1816, in the independence of the former. The first congress met at Tucuman, but the federal cap. was soon transferred to Buenos Ayres. In 1827 a

war broke out between the republic and Brazil, respecting the possession of Uruguay (Banda Oriental), established as an independent state in 1828; and more recently La Plata has been involved in disputes with both Bolivia and France. These wars have contributed to retard the march of her prosperity; but with all her accumulated difficulties, La Plata appears only to require a few years of repose to develop her abundant natural resources, and to become a comparatively flourishing country. (*Parish's Buenos Ayres*; *Head's Journeys across the Pampas*; *Andrew's Journey in S. America*; *Robertson's Letters on Paraguay*; *Scarlett*; *Miers*; *Darwin*; *Amer. Almanack*, &c. *passim*.)

PLATA (RIO DE LA) (*River of Silver*), a large river of S. America, draining with its numerous affluents the greater part of the states of La Plata, Banda Oriental, and Paraguay, with smaller portions of Bolivia and Brazil. It is formed by the union of two important branches, the Parana and Uruguay; and, gradually increasing in width, becomes a very large estuary, entering the S. Atlantic Ocean between Punta Negra (lat. 34° 55' S., long. 58° 5' W.) on the N.E., and Cape St. Antonio (lat. 36° 21' S., long. 56° 42' W.) on the S.W.; having on its N. bank the city and port of Monte Video and the colony of San Sacramento, while, on the opposite side, 124 m. from its mouth, is Buenos Ayres. The basin of this great river is estimated to occupy about 1,250,000 sq. m., being inferior in extent only to those of the Amazon and Mississippi: its length, from the source of the Paraguay to its mouth, is about 2,450 m.

The longest and most direct river, and that of the largest volume, belonging to this great water system, is the Paraguay, which, on receiving the waters of the Parana at Corrientes (27° 20' S. lat.), assumes the name of that branch. It has its sources between lat. 13° and 14° S., in the low ranges connecting the great mountains of Peru and Brazil, which constitute the water-shed between the affluents of the Amazon and those of the Rio de la Plata. Many navigable streams join it from the E., as it passes through Brazil; but those on the W. side, though not so numerous, are much more extensive. Between the 17th and 19th degs. of S. lat. occurs that wide region of swamps called the Lake of Karayes, which, during the periodical inundations of the river, is flooded so extensively as to form a great inland sea, stretching from E. to W. between 200 and 300 m., and from N. to S. upwards of 100 m., with a depth of 10 or 12 ft. At the close of the rainy season, these waters are carried off by the Paraguay, which is navigable from this point to its mouth for vessels of 40 or 50 tons, a direct distance of 1,200 m. The other western affluents are the Pilcomayo and Vermejo, which fall into it between Assumption and Corrientes, both having their sources in Bolivia, and flowing S.E. through the great *chaco*, or desert. The Pilcomayo, after a course of 1,000 m., enters the main stream by two branches, about 60 m. apart: it is shallow, and not navigable even by canoes. The Vermejo, which falls into the main river about 135 m. below that last mentioned, rises on the E. slope of the Andes, and is navigable for large boats through the whole of the level country for nearly 700 m.

The Parana (which, as we have before observed, joins the Paraguay at Corrientes, and gives its own name to its lower part) rises in the table-land of Brazil, in lat. 21° S., hardly 120 m. from the shores of the Atlantic. It flows S. and then curves westward, separating Brazil from Paraguay, and, lower down, divides the latter country from the states of La Plata. It has numerous affluents, but though the main stream be upwards of 1,000 m. in length, it is not navigable for more than 100 m., owing to the *saltos*, or falls, the lowest of which, close to the island of Apipe, is in lat. 27° 26' S., long. 56° 47' W. From this point the river at once becomes navigable for vessels of 300 tons. The most important fall, however, is considerably higher up the stream, in lat. 23° 30' S., being upwards of 50 ft. in height. From Corrientes, the united river, now from 1½ m. to 2 m. in width, flows through a vast channel, much broken by islands, overrun with trees, and subject to inundation. The only considerable trib. of the Parana below Corrientes is the Salado, which rises in the E. Cordillera of the Andes, and after a devious course through the mountains, runs south-eastward through the Pampas, to its junction with the main river, near Santa Fé, in lat. 31° 40' S. Here the Parana divides into numerous branches, formed by pretty large islands, becoming more frequent lower down the stream, which at length opens into the estuary of La Plata, by a long, but narrow delta, having two principal branches. The depth at the mouth is seldom less than 2 fathoms, and there is an uninterrupted navigation throughout the year for vessels of 300 tons from Assumption, upwards of 800 m. from the mouth. It has been estimated, says Mr. Darwin, that "the river, at its source, has only a fall of 1 ft. per mile, and much less lower down in its course; indeed, a rise of 7 ft. at Buenos Ayres may be perceived 180 m. from the mouth of the Parana. But notwith-

standing these advantages, we met during our descent very few vessels. One of the best gifts of nature seems here wilfully thrown away; so grand a channel of communication being left nearly unoccupied: a river in which ships might navigate from a temperate country, as surprisingly abundant in some productions as destitute of others, to another, possessing a tropical climate, and a soil, perhaps unequalled in fertility in any part of the world. How different would have been the aspect of his country if English, instead of Spanish colonists had, by good fortune, first sailed up this splendid river!" (*Voyage of the Adv. and Beagle*, iii. 164.) The inundations of the Paraguay and Parana bear a close analogy to those of the Nile. "Both rivers," says Sir Woodbine Parish, "rise in the torrid zone, nearly at the same distance from the equator; and both, though holding their courses towards opposite poles, disembogue by deltas in about the same lat.: both are navigable for very long distances, and both have their periodical risings, bursting over their natural bounds, and inundating immense tracts of country." The Parana begins to rise about the end of Dec., soon after the commencement of the rainy season in the S. tropic, and increases gradually till April, when it begins to fall somewhat more rapidly till the beginning of July: a second rising, called *repente*, is occasioned by the winter rains S. of the tropic of Capricorn; but it seldom overflows the banks.

The ordinary average of the increase below Corrientes is 12 ft.; but at Assumption, where the river is more confined, the rise is said to be sometimes as much as 5 or 6 fathoms. Occasionally, however, these floods are much higher; penetrating into the jungles of the interior, and drowning numbers of wild animals, the carcasses of which poison the air for months afterwards. The river at these times is exceedingly turbid, from the great quantity of vegetable substances and mud brought down by it: the velocity of the stream in the higher and narrower parts at first prevents their deposition; but as it approaches the lower lands, or pampas, they are spread over the face of the country, forming a grey slimy soil, which increases vegetation in a surprising degree. The extent of ground thus covered during the inundations is estimated at 30,000 sq. m.

The Uruguay, the other great branch of the estuary of La Plata, takes its name from the numerous falls and rapids which mark its course. It is upwards of 800 m. in length, rising in lat. 27° 30', on the Sierra de S. Caherina, in the province of that name, only about 75 m. W. the Atlantic Ocean. Its course is at first nearly due W., but is afterwards turned southward by a mountain-range, separating it from the Parana. It receives several important affluents, of which the Negro, the principal river of Banda Oriental, is the chief. It joins the estuary of La Plata about 50 m. below the junction of the latter; and its clear blue waters may be distinguished from the muddy stream of the Parana for miles after their junction. The country through which the Uruguay flows is of a very uneven and rocky character; in consequence of which the navigation is broken by many reefs and falls, only passable during the periodical floods. Of these, the lowest are the Saltos Grande and Chico, in lat. 31° 30', about 190 m. above its mouth.

The estuary of the Rio de la Plata, the recipient of these great rivers, is about 185 m. in length; its breadth at the mouth being about 130 m., though it gradually becomes narrower, till, opposite Buenos Ayres, it has a width of only 29 m. The coast on the N. side is in general high and rocky; whereas on the opposite side the shores are low, extending inwards in immense pampas. The depth of the river increases towards the mouth, where it averages 10 fathoms; but at Monte Video it scarcely exceeds 3 fathoms, and gradually lessens, so that vessels drawing more than 16 ft. water cannot ascend above Buenos Ayres. E. of Monte Video is an immense bank of sand and shells, called the English bank; besides which there are many other sand-banks, covered when the river is low with only about 8 ft. water, one of which, called the Ortiz, is in some parts between 11 and 12 m. in width. The currents are extremely irregular, both in rate and direction, a consequence of the immense volume of water brought down at certain seasons by the Parana, as well as of the influence of the winds at the mouth of the river: indeed, this variability of the winds and currents constitutes one of the chief difficulties in navigating the Plata, which, on this account, has been termed "*El Infierno de los Marineros*."

In calm weather the currents are generally very slack, and almost as regular as tides, setting up and down the river alternately. The effect produced by the *pamperos*, or S.W. gales, so called from their blowing over the pampas S. of Buenos Ayres, is remarkable from the singular fluctuations in the depth of the water before and after their occurrence; the river being always higher than usual when they begin, whereas, after they have continued for a few hours, the water is forced out to sea, so that the sand-banks begin to appear, and, on some occasions, even

the anchoring grounds have been laid bare! The tides are so much disturbed, and, as it were, hidden by the currents, that it has been affirmed they have no existence; but, according to the *American Coast Pilot*, they are clearly discernible in calm weather, though their rise seldom exceeds 6 ft. (*Amer. Coast Pilot*.)

The Rio de la Plata, which, with its affluents, furnishes an internal navigation of many thousand miles, must, of course, even in its present neglected state, have a considerable commerce, of which BUENOS AYRES and MONTE VIDEO are the great entrepôts, and to which the reader is referred for further details. The river trade, however, is far less extensive at present than is generally supposed; the intercourse with Chili and Peru having greatly decreased since the establishment of independence at Buenos Ayres, and that with Paraguay having been all but annihilated by the exclusive and despotic policy adopted by its present dictator, Dr. Francia. The river is pre-eminently well adapted for steam navigation, and, under more happy circumstances, might become the medium of a trade inferior only to that of the Ganges and the Mississippi. (*Sir W. Parish's Buenos Ayres and La Plata*, p. 179—206.; *Voyages of the Adventure and Beagle*, ii. and iii.; *Amer. C. Pilot*, &c.)

PLATÆA, a considerable city of ancient Greece, now wholly in ruins, in Boeotia, at the N. foot of Mount Cithæron, about 7 m. S.W. Thebes. This town has acquired an immortality of renown from its having given its name to the great battle fought in its vicinity, on the 23d September, anno 479 B. C., between the combined Greek forces under Pausanias, and the Persian army under Mardonius, generalissimo of the forces left by Xerxes in Greece. The Grecians gained a most complete victory. Mardonius was killed in the action; and the camp to which the fugitives retreated having been forced, a prodigious slaughter took place. In fact, with the exception of about 40,000 horse, who escaped under Artabazus, the entire Persian army, said to have been nearly 300,000 strong, was all but entirely annihilated. (*Herod. lib. ix. cap. 68*.) The victorious Greeks, besides securing the independence of their country, found an immense booty in the camp of the Persians. A tenth part of the spoil was given to Pausanias, the general, whose great talents materially contributed to the success of the day; and another tenth was set apart as offerings to the gods. From the produce of the latter was presented to the shrine of Delphi a golden tripod, supported on a brazen pillar formed of three serpents twisted together. And it is a singular and curious fact, that this identical pillar, having been carried to Constantinople, still exists in the Hippodrome of that city! (*Herod. lib. ix. cap. 80*.; and the arts. CONSTANTINOPLE, and DELPHI, in this work.)

Notwithstanding the services the Platæans had rendered to the common cause in this great struggle, their city was, at a subsequent period, anno 374 B. C., taken and razed by the Spartans. But she was afterwards restored, and her walls rebuilt, by Alexander the Great. The existing remains of the city date from the era of that conqueror. (*Dodwell's Greece*, i. 278.)

PLAUEN, a town of the k. of Saxony, circ. Zurichau, cap. districts Plauen and Pausa; on the White Elster, 68 m. S. by W. Leipsic. Pop., in 1837, 9,485. It is built on uneven ground, walled, and has several churches and hospitals, a gymnasium, and a royal castle. It is a thriving town, with manufactures of linens, and cotton goods and yarn; it has also considerable markets for wool. Pearls are occasionally found in this part of the river; and there is a royal pearl fishery at Oelsnitz, in the neighbourhood. (*Berghaus; Murray's Handb. for S. Germany*.)

PLYMOUTH and DEVONPORT (for, though separated in their municipal and political privileges, they constitute, in fact, parts of the same town), two parli. bors. and sea-port towns of England, co. Devon, and hund. Roborough, making together the principal naval port of Great Britain after Portsmouth, at the bottom or N. end of Plymouth Sound, on a kind of rocky promontory between the Tamar and Plym, 36 m. S.W. Exeter, and 198 m. W. by S. London; lat. old church, 50° 22' 14" N., long. 4° 7' 32" W. The pop. of the different towns and districts, popularly included under the term Plymouth, has been, in 1801, &c., as follows:—

	1801.	1811.	1821.	1831.	1841.
Plymouth - - -	16,040	20,803	21,591	21,080	30,527
Devonport - - -	23,747	30,083	33,578	34,885	33,222
East Stonehouse -	5,407	6,174	6,043	9,671	9,711
	45,194	56,060	61,212	75,534	80,060

These towns had together, in 1841, 8,799 inhab. houses. There is a large excess of females, the latter having amounted in the same year to 45,115, and the males to only 35,045. The towns are built on rather unequal ground; Plymouth being on the E., and Devonport on the W. side of the space (3 m. broad) between the two rivers: the

medial suburb of Stonehouse connects (with the help of a bridge over Stonehouse-pool) the two towns.

Plymouth is old, and irregularly laid out; several of its streets are narrow and ill-built, a few also being steep. Many improvements, however, have been made within the last few years, and it has now several handsome streets and good squares, lined with substantial stone houses. Devonport, formerly called Dock, may be said to be the new town of Plymouth, having been almost entirely built since 1760: most of its streets are straight and wide, and the older houses are being gradually replaced by handsomer and more substantial buildings. Its wide, handsome streets, which cross each other at right angles, are paved with limestone quarried in the neighbourhood. Both towns are well lighted with gas; and water is abundantly supplied to Plymouth by the corporation, and to Devonport by a joint stock company.

The principal public buildings of Plymouth are, a modern, though by no means handsome, guildhall, with a small attached bor. gaol; an exchange, and custom-house; a very elegant edifice, called the Athenæum, belonging to the Plymouth Literary Institution; a public library; a splendid hotel and theatre, built by the corporation, at an expense of nearly 40,000*l.*; the Royal Union Baths, and a plain stone structure called the Freemasons' Hall. A new and extensive market-place has also been formed, at an expense of more than 10,000*l.*; and it has several barracks, hospitals, and prisons belonging to government. The Naval Hospital, at Stonehouse, is of great extent, and admirably arranged; and opposite to the water-entry of this hospital is the Royal Military Hospital, with an arcade of 41 arches, supporting a terrace, and covered promenade below: there is, also, a large military prison at Mill-bay, capable of accommodating nearly 3,000 persons. One of the most striking features of Plymouth is its citadel, erected on a commanding eminence in 1670: it has five bastions, and is surrounded on three sides by a deep ditch and counter-scarp: the interior comprises a governor's house, residences for numerous military officers, and extensive barracks. The victualling office, erected about 10 years since, at Duval's or Devil's Point, S. of Stonehouse, is of large size, and replete with every convenience. W. of the citadel is the elevated walk called the Hoe, which commands a fine view of the Sound and the surrounding country, including Mount Edgcombe, with the Cornish hills in the W., the high land of Dartmoor in the N., and Saltram, its neighbourhood, and distant towers in the N.E. Plymouth is divided into two parishes, St. Andrew and Charles the Martyr, of the annual value of 920*l.* and 612*l.* respectively: both have been till very recently in the patronage of the corporation. St. Andrew's church, erected at different periods between the 12th and 15th centuries, is a large and rather handsome structure, with a square embattled tower; its interior comprises accommodation for 2,500 persons, and is, on the whole, elegantly arranged. Charles's church, built towards the close of the 17th century, and named after King Charles I., is a neat building, with a square tower surmounted by a light steeple. There are two chapels-of-ease, one in each par., besides the chapel in the citadel, and the mariners' church, for which a new structure, called Trinity Church, is in course of erection. There are 2 Baptist chapels, and 2 others belong to the sect denominated "Plymouth Brethren." The Wesleyan, Associated, and Bryanite Methodists, Independents, Presbyterians, and Unitarians, have each one or more chapels; and there is a meeting-house for the Society of Friends, and a synagogue. Five Sunday-schools are attached to the Established Church; and religious instruction is furnished by the Dissenters to several hundred children of both sexes. A grammar-school, in the patronage of the corporation, is attended by from 20 to 30 boys; and another school, formerly proprietary, furnishes a good general education to about 50 boys. There is, likewise, an endowed charity-school for 80 children of each sex. Dame Rogers's charity gives clothing and instruction to 52 girls; and a Lancastrian school is attended by 176 boys, and 120 girls. An orphan asylum was established some few years ago; and there are 4 sets of almshouses, besides the "South Devon and East Cornwall Hospital," and "Public Dispensary," for providing the poor with gratuitous medical aid; and other benevolent and religious institutions supported by voluntary contributions. The literary establishments comprise the Plymouth Institution, or Athenæum, for the promotion of science and literature; the Natural History Society of Devon and Cornwall; a public library with 6,000 vols.; a medical library, established in 1794; a law library, established in 1815; a theological library; and a mechanics' institute. There are 5 weekly newspapers, of which 2 belong to Plymouth, and 3 to Devonport.

Devonport, unlike Plymouth, is a regularly fortified town, surrounded by lines commenced in the reign of George II., but since much improved. It is also defended by the fortress of Mount Wise, between the town and the harbour on the S., and by a fort on Mount Pleasant to the N., and a battery at Obelisk Point on

the peninsula of Mount Edgcombe, on the opposite side of the harbour. Inasmuch, however, as several of the adjacent heights command the town, it could not oppose any effectual resistance to an army attacking it by land; but it is quite secure from any attack by sea. Close to the fort of Mount Wise is the governor's house, a handsome stone building, fronted by a parade, forming a favourite promenade: on its N. side is the port admiral's house, a recent and capacious stone building. A town-hall was erected a few years ago, and other edifices for various purposes have been built since the grant of the charter in 1838. Opposite the town-hall (which is a neat Doric structure) stands a fluted column, intended to commemorate the naming of Devonport, in 1824: its summit commands a fine view of the harbour and surrounding scenery. The par. church is at Stoke-Damerell, nearly 1 m. N.E. the town; but there are 3 Episcopal chapels of ease, one of which is attached to the dock-yard. The Baptists, Independents, Wesleyan Methodists, and Unitarians, have each places of worship, with attached Sunday-schools: there are also several endowed and subscription schools, furnishing instruction to nearly 5,000 children of both sexes. A public dispensary and savings bank have also been established. Devonport, however, is mainly dependent on its dock-yard, which, indeed, constitutes by far the most interesting feature of the united town.

Plymouth has been, for a lengthened period, the second naval harbour of Great Britain. The dock-yard at Devonport, commenced in the reign of William III., is one of the finest establishments of its kind in Europe. It extends along the shore of Hamoaze 3,500 ft., with an extreme breadth of 1,300 ft., including an area of 72 acres: the entrance on the land side is from Fore Street, one of the principal thoroughfares of Devonport. The basin of the dock is only 250 ft. in length, and 180 ft. in width; but the excellence of Hamoaze as a natural harbour renders a larger basin of less importance. The wharf-wall extends along the shore; and the depth of water is such as to allow the largest ships of the line to come close up to the principal jetties to take in stores.

The dock-yard is divided into two pretty equal parts by a canal (similar to that in Portsmouth), which furnishes easy access for boats to the storehouses, roperies, smithies, &c. In the N. half, and facing the harbour, are 2 dry docks for ships of 120 guns, with jetties for their accommodation after having been undocked. A fine double dock, for ships of 74 guns, communicates directly with the harbour, and a smaller dock opens into the older basin, in addition to which a capacious new basin is now being formed in the S.W. part of the yard. The roofs of the docks are extraordinary specimens of architectural skill, each being formed of a single arch, unsupported either by buttress or pillars. Workshops and sheds are erected in various parts, and a quadrangular range of fire-proof stone buildings comprises magazines of stores, sails, rigging, &c. At the N. end, also, is a range of handsome houses, with attached gardens, forming the residence of the principal officers. On the S. side of the yard are building-slips for large vessels, and others for those of inferior size: near these is a building in which planks are steamed, when required to receive any particular curvature; and in this part, also, are extensive timber-berths, sawpits, and mast-houses, besides a large pond in which masts, yards, &c., are kept soaked to prevent their cracking by exposure to the sun. The blacksmith's shop, about 200 ft. square, comprises many forges. Anchors are made in it of the largest size. The ropery, which is the finest in the kingdom, comprises 2 ranges of building, each 1,200 ft. in length, and 3 stories in height, built entirely of stone and iron, as a security against fire: contiguous to them is the hemp-magazine. In this part of the yard, also, is the model-loft, in which are the patterns of the various parts of ships ordered to be constructed by the Admiralty.

The gun-wharf, or arsenal, separated from the Dock-yard by North Corner Street, includes within the walls about 4½ acres: it has two principal warehouses for muskets, pistols, and other small arms, with sheds for gun carriages, a powder magazine, and a cooperage.

A great number of men are employed in the different departments of the dock-yard, especially during war, or when a fleet has to be fitted out; and the scale on which the various operations are conducted, the diversity of the employments, the perfection of the machinery, and the activity prevalent throughout the establishment, are all objects of admiration. But no individual who is not in uniform, or is not well known to the authorities, is allowed to enter the dock-yard, unless by special permission.

The harbour of Plymouth is double, being formed by the estuaries of the Plym and Tamar, opening into the N.E. and N.W. angles of Plymouth Sound: the estuary of the Plym forms the Catwater, a convenient and capacious harbour for merchant-vessels; and that of the Tamar expands into the noble road or harbour of Hamoaze, about 4 m. in length, by about ½ m. in width: it is almost completely land-locked, and has moorings for 100 sail of the line, with secure anchoring-

PLYMOUTH

period for a still larger number, its average depth is
between 40 and 50 fms and the largest clays that it is
the gyps. Subordinate to the history of Carver is
common and a small thin layer to the E. of the (stage)
arranged by gyps for the accumulation of salt or other
of events, and being made by which it is almost
entirely composed by this way into the W. of
system. A few is to some of the outcrops for
the accumulation of the largest clays at all times
of the sea. During this time from 10 ft. to 15 ft., and
even from 20 ft. to 30 ft.

The barge arm of the pen, called Plymouth Quay, in which three barge-booms open, is used as the accommodation of the ships that have been refitted in the dockyards, and as a safe asylum for all sorts of a ship in stormy weather. Being, however, to the heavy swell thrown in over the R. it was formerly a very unsafe place for anchoring, and, to obviate this inconvenience, a stupendous breakwater, or mole (similar to that of Cherbourg, at least to that of Long Beach, constructed by the emperor Tejan, — or Cerva Varnick) has been formed in the middle of the bay, stretching in a line, straight, in the middle but bent towards an other extremity, from 1 m. to length between a second bay on the one side and Durrant Bay on the other. From the commencement of the work to July 31, 1843, \$1,772,000 have of been expended from quarters on the banks of the Plymouth, consisting of rough labour, masonry, earth, carrying from 1 to 2 tons and upwards had been employed in this great work. The 1st promontory has surface almost ten miles in width where it abuts on both sides to the bay, on the promontory alone being on the side next the bay. Bathurst is now being worked on by W. extremely

[illegible]

The Harrods is bounded on the E. directly opposite to the west by the immediate grounds of Mount Edgecumbe, the seat of the noble family of Edgworths. On the opposite side of the Harrods, and up to the W. side, to the west of Dublin (which are)

In the water barrens there are wet and dry beds, the latter related to the rapid action of the glaciers. Just the very years they have been used extensively for sheep grazing. On the E side of the Canyon are the remains of Chert and Turbidity, mostly covered by pebbles exposed in the dry beds or otherwise exposed with no trace of the pebbles in this direction, also are the only exposed remains of lignite and Lower Permian. Some flint at the N.W. extremity of the Carleton granite basin, is a very characteristic object. It is surrounded by an ancient moraine.

The trade of Pymouth is of considerable importance; as great numbers of fish are consumed in 1908 to 1909, 2,000 tons belonged to the port on the 1st Jan. 1911, the selling capacity being between 2,500 tons and 3 steamers.

A large part of the trade of the town depends on the wharfed, and trading is of course a privileged article of export. Steamers touch here almost daily on their passage between London, Dublin, Belfast, &c. and home on twice or three a week and from Southampton by maintaining steady shipments of Plymouth produce a very extensive coal and iron, a sugar refinery, glass-house, starch factory, and a soap boiling establishment, which produced in 1868 £1,177,000 the harbor was by arrangement was with the post-office &c. of the Plymouth is traversed by an iron bridge of five arches, raised on granite rock built at the sole expense of the late Earl of Mountbatten, of most excellent carriage, horse passengers, &c. are carried over to Cornwall by a kind of floating stream-bridge running every quarter of an hour between Tavistock and Looe-ports. Plymouth is crossed by railways (the Bampton branch, and the metropolitan, the journey being performed in less than 4 hours. The fleet of England has a branch here, and the Western District

PLYMPTON EARLE 20

Building Company the Dimes and Cornwall Building Company and the National and Provincial Bank of England, have establishments both at Plymouth and Devonport besides which there are the "Naval Bank," and two others banks.

Plymouth was incorporated in 18 May 91. Its present municipal officers are a mayor 11 other aldermen, and 36 councillors, the law being divided into six wards. Corporation business in 1887 & 1888 Quarter and petty sessions are held under a recorder, and there is also a law agent court for the trial of civil suits. A county court is established here before which 700 plaintiffs were entered in 1888. Devonport has also been made a corporate town, and divided into wards the municipal officers being a mayor aldermen and councillors. It has a representation of the peers under a recorder. Corp. rev., in 1888-9, £1,334. Plymouth has regularly sent 3 knights to the H of C since the reign of Henry IV., but it occasionally elected the franchise as an entire port. The electoral franchise was once got by the Fishers Act, so as to include with the old bar a small portion of land H B. The town on the Water side, Bay street, is 1888 in 1,334. The Fishers Act constituted Devonport a pari bar and embraced in it the privilege of returning 3 knights to the H of C. The electoral franchise came on the part of South Devonport and vicinity of Devonport Bay streets, in 1888 in 1,334. Water Plymouth and Devonport is attached to poor-law unions, but the responsibility of the water here in 1888 amounted to 17,364 of which since 18,000 were regarded as the poor of Plymouth. Markets on Plymouth on Monday, Thursday, and Saturday, in Devonport, on Tuesday, Thursday, and Saturday, both abundantly supplied with every kind of provisions.

It was actually called Tancquerath, and after-
wards, as English words, changed to the present name
all of the intervening years, to the reign of Henry
eighth occurred a remarkable accession of
the population of the community, and in the
year it was found to be short of a supply of
grain by a quantity of so much that it
planned by the famous Sir Francis Drake, a
man of the time. During the same reign, Plymouth
Sound was the rendezvous of the fleet against the
Spaniards, and also of the fleet sent against Cadiz. The
area suffered greatly on three occasions, from the
plague, which in 1588, carried off 3,000 persons. During
the parliamentary wars it contained the camp of the par-
liament and was besieged by Prince Maurice and the
royalist, though without success.

Development, as it is already stated, to guide a modern town which owes its rise to the rapidly increasing immigration of the dockyard during the American and French wars. Southwark, which contains 14,000 inhabitants with Deptford is still more modern, and has lately wholly built within the present century. As these towns suffered most severely in 1831-32 from the cholera, (See *Times and Times Reports* Presses inf.)

Plymouth is a town and one of the U. States, in Massachusetts, cap. co. of its own name, 33 mi. S. E. Boston lat 41° 47' N. long 70° 47' W. Pop. in 1880, 4,744. It has a court house, jail, bank, covered sidewalk, etc. and many a town and country churches, town works, and mills the machinery of which is imported by a rivulet intercepting the town. The harbor, though spacious is so shallow that vessels drawing more than 10 or 11 ft. require at night to be towed to a distance from the wharfs. The burden of the shipping belonging to the port amounted in 1880, to \$2,000,000. Plymouth is the chief town in New England, its foundations having been laid in 1490.

PLYMPTON BARLE or **PLYMPTON MAU-**
RICE & damaged the market-town, and part of Eng-
land on Devon, bound the town walls, of an 800-
square Acres of borough and parish, which are ex-
tensive. The town P-p in 1841 338 The town
comprises two streets disposed in the form of the letter
T, and it has an old gaolhouse, under which is held
the town market. The church is small, and the living
is a rectory subject to the advowson parish of
Plympton in Here. The Wesleyan Methodists and Inde-
pendents have places of worship. W of the town are
the ruins of a more magnificent castle occupying nearly 9
acres of ground. It was built by Richard de Brown, Earl
of Devonshire to whom the town was granted with "the
burton of Plympton" by Henry I. Plympton Barle
claims to be a bar by prescription, but received a royal
charter in the 12th Edward III. It was one of the man-
gery towns but for the y years it has been in a degen-
ing condition, and the bar was not considered of suffi-
cient importance to be included in the provisions of the
Municipal Reform Act. But, damaged as it is, it owes its
name to the H of C. with some interruptions, from the
reign of Edward I down to the Reform Act, by which it
was most properly disfranchised. Markets on Saturday
fair for cattle and woolen cloth, Feb. 25, April 6, Aug.
15, and Oct. 20.

Antiquities of Pola; Murray's Handbook, p. 295; *et Wheeler, Voyage d'Italie, &c.*, l. 48. 12mo. edit.)
POLAND (Lat. *Sarmatia*; Pol. *Polsk*, signifying a plain country), formerly the name of independent and extensive country of Europe, comprising the territories between the 49th and 58th degs. N. lat., and the 15th and 33d E. long.; including, with Poland Proper, Prussia, Samogitia, Courland, the Ukraine, Podolia, and other provs. now belonging to Russia, with Galicia, belonging to Austria, the Province of Posen, and some other districts in Prussia. But the existing kingdom of Poland, constituted by the Congress of Vienna in 1815, and now united to the Russian Empire, is of comparatively limited dimensions, extending only between the 50th and 58th degs. of N. lat., and 18th and 24th degs. of E. long.; having N. Prussia under the Russian gov. of Wilna; E. the govts. of Lublin, Grodno, Bialystok, and Volhynia; S. Austrian Poland and the territory of Cracow; and W. Prussian Poland (the grand duchy of Posen) and Silesia. Area, and subdivisions, &c., as follow:—

Governments.	Area in sq. m.	Pop. in 1847.	Chief towns.
Posen	14,290	1,555,950	Warsaw.
Prussia	9,329	954,084	Radom.
Ukraine	11,945	1,013,434	Lublin.
Podolia	6,430	619,907	Ploek.
Samogitia	7,367	547,319	Suwalki.
of Warsaw	-	166,997	
Totals	49,300	4,857,700	

the pop. about 3-4ths consist of Poles, 1-10th of Russians, and the remainder principally of Russians, Germans, Gypsies, and Tartars.

The whole country, except in the S., where are some rugged offsets from the Carpathian Mountains, is an undulating plain, with a general slope towards the Baltic, which its principal rivers have their embouchure. The principal rivers are the Vistula, with its tributaries, the Wieprz, Narew, Pilitsa, &c., the Niemen, and the Warta. The Vistula, after bounding the kingdom for a lengthened distance on the S., traverses its centre, leaving it near Thorn.

Niemen, Bobr, and Bug bound nearly all the E.; the Prosna, a tributary of the Warta, a considerable part of the western frontier. These rivers are all more or less navigable. There are innumerable smaller streams, and being an extremely well-watered country; and in the N., E., and W. are a great number of lakes and very extensive marshes. The surface, though abundantly diversified, presenting alternately fertile corn lands, savage steppes, rich pastures, sandy heaths, dense forests, and dreary swamps. The climate is rigorous; the cold of winter is often as great as in Sweden, in a lat. 10 degs. higher; and in 1799, the thermometer descended to 27° below zero (Réaumur). In summer, however, the heat sometimes rises to 120° (Fah.).

The mean temperature of the year at Warsaw is about 50° Fah. The atmosphere is humid, rainy and cloudy occupying half the year. Between the Vistula and Prussian frontier the soil is generally fertile, the most productive districts being in the govts. of Cracow and Sandomir, and the neighbourhood of Warsaw. The N.E. are also some very fertile tracts; but there, in the govts. of Ploek, Lublin, &c., the surface is in part waste.

The traveller in Poland sometimes finds himself in a vast expanse of surface, almost without a house, a tree, or a single object large enough to attract his notice. The hills, however, are described the skirts of some vast forest fringing the distant horizon; and, on entering it, proceed for 8 or 10 miles, more or less, winding with a road, through lofty pines, &c., precluded from the view of all objects but trees and shrubs. Sometimes, in the midst of a forest, we meet with a small spot of ground (for example, of 10 or 20 acres) cleared and cultivated; and is prettily fenced by the green surrounding woods. Sometimes a small lake is found thus situated, its borders fringed in a similar manner; and these, generally speaking, are the prettiest scenes which Poland furnishes. The forests, in some places, are 15 and even 20 m. in length. Indeed, if we exclude morasses and the pasture lands, perhaps not more than half of the country, speaking generally, is cleared. At distant intervals are found plains of some extent, affording rich pastures. The best are those contiguous to the Vistula, some of which are periodically overflowed by that river. Such are those in the neighbourhood of Warsaw, which supply that town with good butchers' meat."

Metz's View of Poland, p. 29—53.) This description was written early in the present century; and, though a considerable proportion of forest land has been cleared in the interval, it is still substantially accurate. Of 741,000 acres of land comprised in the kingdom, 265,000 *ac.* are

supposed to be arable; 205,000 in forest; 171,000 in natural pastures, rivers, and marshes; 46,000 in meadows; 33,000 occupied with roads and buildings, and 26,000 in gardens. Poland has, for a lengthened period, been the granary of a great part of Europe. But Volhynia, Podolia, and Galicia, formerly included in the Polish domain, were the principal corn-growing provs.; and in the existing kingdom of Poland, with the exception of Sandomir and Cracow, the land, according to Mr. Jacob, is so poor that it can scarcely be made to yield a medium crop of wheat more than once in 9 years. The soil is mostly thin, sandy, or sandy loam, resting chiefly on a bed of granite, through which the heavy rains gradually percolate. S. of the Pilitsa, however, the appearance of the land and the face of the country improve; and as we proceed southward to the Vistula, the surface becomes more undulating, and the soil stronger and more tenacious. In this quarter there are extensive tracts of clayey loam, requiring three or four horses to plough it, and yielding, when tolerably well managed, excellent crops of wheat and oats. Where, in this district, any thing like a system of rotation is adopted, the crops are very heavy.

Some of the estates belonging to the nobility of the highest rank are of enormous extent; and, not long since, those of Prince Czartoryski and Count Zamoycki, taken together, occupied a space nearly equal to half the extent of England! In the times of the republic, the former contributed 30,000, and the latter 10,000 men to the army. Owing, however, to the practice of dividing the land equally among the children, unless a majorat be established in favour of the eldest son, which is sometimes the case, much of it is possessed in smaller allotments. These, however, we should still call large, for they mostly vary from 5,000 or 6,000 up to 30,000 or 40,000 acres each. The rent and price of land is generally low; depending much more on the number of peasants than the extent of the farm. The crown-lands, comprising 1-3d part of the whole surface, or about 10 million acres, include perhaps 2 million acres of wood, the remainder being chiefly arable land, leased to tenants, who, in consequence, acquire right to the services that may be legally demanded from the peasantry. The tenants of the crown are exempted, as well as their peasants, from some taxes, to which the other occupiers of land are subject, and, in consequence, the crown estates are better stocked with peasants. With this freedom from taxation and ample supply of labourers, the rent of 8,000,000 acres of land is said by Mr. Jacob, from whom we have borrowed these details, to have amounted, in 1827, to no more than 4,000,000 florins, about 95,000*l.* sterling, or somewhat less than 2*d.* the English acre. But a large extent of land is included in this average that is literally of no value; so that, according to Mr. Jacob, the rent of the cultivable land may be fairly set down at from 8*d.* to 14*d.* per acre. It might, however, have occurred to Mr. Jacob, that, in point of fact, the money rent of land, in a country like Poland, without towns and without a market for its produce, affords no test whatever of its real value. Lands belonging to private individuals are rarely, indeed, ever let, except for services to be performed on the other parts of the same estate; and the value of the land is to be determined not by the amount of the money rent it will bring, but by the amount of subsistence it affords, or the number of individuals it will maintain in an average state of comfort, according to the customs and habits of the society. Nothing, indeed, can be more perfectly inconsequential and absurd than to set about measuring the value of land in such a country as Poland by the same standard by which it is measured in England. Formerly the whole lands of the republic were the property of the nobility or gentry, and could not be held by any one else. The possession of land was, in fact, of itself, a proof of nobility; and the owner of an estate of 3 acres in extent voted in the elections of nuncios, and, in respect of political rights and privileges, was on a level with the richest nobleman in the country. But this state of things is now wholly changed. Landed property is no longer the appanage of a particular class; but may be indifferently held by nobles, burghers, and peasants. Jews only are prohibited from becoming proprietors of the soil, though they have numerous mortgages thereon. When they foreclose, the lands must consequently be sold; and as the Jews, who engross the greater part of the money capital of the country, cannot become purchasers, the prices they yield are very trifling. Latterly, however, some modifications have been made in the regulations respecting the Jews, and various privileges have been conceded to them.

The most numerous class of cultivators are peasants, who are a species of *quasi* proprietors of the lands they occupy, holding them under condition of working a stipulated number of days in each week on their lord's demesne, and paying him, in addition, specified quantities of poultry, eggs, yarn, &c. The extent of their holdings varies according to the quality of the land, the quantity of work to be performed, and of payments in

kind to be made. On a large property examined by Mr. Jacob, the peasants had each about 48 acres of land, for which they were bound to work two days a week with a pair of oxen. If their further labour was required, they were paid at the rate of 3d. a day for two days more, and if beyond that number, they received 6d. a day. On another property, the peasants had about 36 acres, for which they worked 2 days a week with 2 oxen; when called upon for extra labour, they were paid 6d. a day for themselves and their oxen for the next 2 days, or, without the oxen, 3d.

Under the republic, the Polish peasants were slaves, and did not, in fact, enjoy any greater consideration than the blacks of Carolina and Georgia in the present day. They were the absolute property of their masters. Down to 1768, a lord who had killed his slave was merely amerced in a small fine; and though, in that year the offence was made capital, such an accumulation of evidence was required to prove the fact, that the enactment was rendered quite nugatory. (Coxe, i. 113.) It was customary to make the slaves work five days a week on the estates of their lords; the latter, also, might seize on whatever wealth the slaves had accumulated, might inflict on them corporal punishment, and might sell them as if they had been so many head of cattle. The boasted freedom of Poland was, in truth and reality, merely the license of the gentry to trample under foot the mass of the people, to browbeat their sovereign, and sell their votes. It is due, however, to the nobility to state that some amongst them, as the Zamoysskis, the Czartoryskis, and others, perceived the miserable consequences of such a state of society, and were most anxious for the improvement of the peasantry on their estates, of whom they emancipated considerable numbers. Generally, however, the Polish gentry were not inclined to establish or give efficacy to any regulations in favour of the peasantry, whom they scarcely considered as belonging to the same race of beings as themselves, or as entitled to the common rights of humanity. Under these circumstances, no one will be surprised to learn that the Polish peasantry, at the dismemberment of the republic, were in the lowest state of degradation, being at once ignorant, indolent, addicted to drunkenness, poor, and improvident in the extreme. (Coxe's Travels, i. 14.; Voyage de deux Français dans le Nord de l'Europe, v. 105.; Busching's Geog.; Introduc. to Account of Poland, § 4.; Connor's State of Poland, passim; Coyer, Vie de Sobieski, i. 129.; Malte Brun, Tableau, &c.)

The servitude of the peasants was modified by the constitution of 1791, and it was wholly abolished in the grand duchy of Warsaw, nearly identical with the existing kingdom, in 1807; the labour and services due by the peasants to their lords having been since regulated and defined by law. Owing to the ignorance of the peasantry, the influence of this great and salutary change was for a lengthened period less considerable than might have been supposed. Though the peasants may now leave one part of the country to settle in another, they must first pay off any debt that may be owing their lords; and from inability to do this, and various other circumstances, they do not often quit the estates on which they were born. When a young peasant marries, his lord assigns him a certain quantity of land, sufficient for his maintenance and that of his family in the way in which they have been accustomed to live. Should the family grow numerous, some little addition is made to the grant. At the same time, the young couple obtain also a few cattle, as a cow or two, with steers to plough their land. These are fed in the stubble, or in the open places in the woods, as the season admits. The master also provides them with a cottage, with implements of husbandry; in short, with all their little moveable property. Owing to the powerful influence of old habits, but few peasants improve the little stock committed to their management; their conduct, according to Mr. Jacob, being most frequently marked by carelessness and a want of forecast. This, however, is by no means uniformly the case: there have been many instances of accumulation; indeed, several of the peasants have become proprietors, while others have hired a larger extent of land. But it will require the lapse of a lengthened series of years before any very general change be made in the habits and condition of the bulk of the people.

Speaking generally, the houses of the Polish peasantry are miserable hovels. They are all built of wood: even "those of the better class have merely the ground floor. On the exterior they are, in every point of view, humble, very often mean in appearance: the interior is occasionally somewhat better, though an Englishman looks in vain for any thing like comfort. There are usually 2 or 3 ordinary rooms, whitewashed, though only one serves, for the most part, as a sitting-room. The floors are sometimes of earth only, but more frequently planked. A bed stands almost always in every room." (Burnett's Travels, p. 126.) The villages, which are of the most

wretched description, are thinly scattered, rather along the skirts than in the midst of the forests, and sometimes in vast bare heaths, where no other object is to be seen. They consist of from 10 to 50 miserable huts, rudely constructed of timber, and covered over with straw, turf, or shingles; and afford so imperfect a shelter, that the inhabs. are glad to stop up the chimnies in winter, and to be half smothered with smoke, rather than die of cold. Each of these huts consists generally of only one apartment, with a stove, round which the inhabs. and their cattle crowd together. Bad as these villages are, you may travel 10 m., even in the clear part of the country, without seeing one, or indeed beholding any human habitation. The common diet of the peasantry is cabbage; potatoes sometimes, but not generally; pease, black bread, and soup, or rather gruel, without the addition of butter or meat. Their chief beverage is the cheap whiskey of the country, which they drink in quantities that would astonish the best customers of the gin-palaces of England. Their houses generally have little that merits the name of furniture; and their clothing is at once coarse and disgustingly filthy. These, however, are only their general characteristics. The condition of the peasantry depends much on the character of their lords, and upon the more or less embarrassed state of the property on which they may be settled. On the estates of opulent and enlightened landlords, it is wholly different from what it is on the estates of those of an opposite description, and may, indeed, be said to be decidedly comfortable.

It is, perhaps, hardly necessary to state, that from the labour applied to the lords' estates being rendered as compulsory service, it is performed in the most negligent and slovenly manner possible. Mr. Jacob says that all the operations of husbandry are very ill executed; the ploughing is shallow and irregular; the harrows, with wooden tines, do not penetrate sufficiently to root up weeds in fallowing; so that the land is always foul, and in bad order. The same want of attention prevails in thrashing. In short, the natural effects of the system of duty-labour are strikingly visible in the whole administration of most of the large estates where it is followed; and is hardly even prevented from exhibiting itself on the estates belonging to the few proprietors who have intelligent and active managers, and are free from pecuniary embarrassments. The common course of crops is the old system of a whole year's fallow, followed by winter corn, and that by summer corn, and then a fallow again, so that 1-3d part of the land bears nothing. The winter crop, in the N. of Poland, consists of wheat and rye, the latter being to the former nearly as 9 to 1, the little manure that is preserved being laid out on the wheat land. In the S. part of the kingdom, the wheat bears a larger proportion to the rye, amounting, on the more tenacious soils, to 1-5th, and in some cases to 1-4th part, or upwards. On a well-managed farm in the prov. of Lublin, the quantities of seed and produce are said by Mr. Jacob to have been as follows: Potatoes, about 20 bushels to the acre planted, and about 200 bush. raised; wheat, 2 bush. sown, and from 16 to 20 reaped; rye, 2 bushels sown, and from 12 to 15 reaped; buck-wheat, 3 bushels sown, and from 10 to 15 reaped. The barley and oats scarcely yield four times the seed. Manure is applied after potatoes for the wheat, the former having the benefit of fallowing. This farm was one of the few in which all the labour, except that of the oxen and their drivers, was paid for in money, and not in produce. The common plan of thrashing is to give the thrasher a certain proportion of the corn, varying, according to circumstances, from the 14th to the 18th bushel. In the generality of farms, the increase is considerably less than the above; the average produce of wheat being estimated at not more than 14 or 15 bushels; rye, 10 or 12; barley, 14 or 16; and oats and buck-wheat, from 8 to 12 the acre; or at not more than half the average produce of similar crops in England. In the S. parts of Sandomir and Cracow the crops are more than usually heavy; but they are celebrated more for the excellent quality of their corn than for its greater produce. In Sandomir, a narrow district about 60 m. in length, extending along the Vistula, produces the heavy and fine grain known in London as Dantzic white wheat, but the average growth is rarely beyond 20 bushels an acre.

The stock of cattle is small in proportion to the extent of land and the number of the inhabs. The Polish horses, formerly held in high estimation, have much degenerated, and a good breed is to be met with only in a few studs. A miserable race of colts is employed to transport merchandise, and field labour is almost wholly performed by oxen or cows. The latter are small, and generally kept in bad condition, both as to food and cleanliness. They are mostly stall-fed, but, from negligence, yield very little butter, and no good cheese. The common breed of the country may be worth from 27s. to 30s. a head; but considerable numbers of a superior breed are annually imported from the Ukraine, which may be worth 3l., or upwards, a head. Previously to the late

Polish, the total number of sheep in Poland was only estimated at about 5 millions; but through the use of extremely well adapted sheep breeding, Polish breeds were greatly inferior to those of Sax and there were very few flocks of fine-worsted sheep; only however, the Polish breed has improved very much in point of quality, and is now sent to large fairs to the markets of Leipzig, Berlin, and Bremen, as it sometimes brings a very high price. Hops, though not very numerous, are of a good brand, originally Hungarian.

As horses bred directly on the land are not very numerous, they are imported and principally compensated by coal sales. A small sum is levied in each district in respect of roads, bridges, and other local purposes, but that and the land-tax do not exceed 10 per cent on the estimated current value of the land, which is only far below its real value. The other taxes fall on the different stages of the commodity. Thus salt is not in fact levied by the government, the levy-duty being paid on foreign commodities, such as coffee, wine, &c. The great mass of the population, however, is obliged to purchase such taxation, either in kind or with money (of which they are not very deficient).

As forests are highly important, and in the parts of Upper and Polish they cover more than a third of the surface, though in some of the other parts have been much impoverished, and constantly cut down, chiefly in the part of Lesser Poland, where, however, the wood that is supplied by coal, is not so much as in the parts of Greater Poland, where, as the principal forest trees, and the Polish and Russian are decidedly preferable to those of Austria.

Most of the large forests belong to the crown, and are leased to private individuals, or to the crown itself. Mr. Jacob states that the wood cut in one of the forest lands belonging to the crown produced 200,000 cubic feet of wood in the year 1840, the value of the wood at the time of the sale, or the in the part actually cut, was 1,000,000 florins (or 1,000,000 francs).

Among the wild animals may be specified the bison (Bison), found in the vast forests of the part of Poland, traversed by the Rhenus. The Emperor Alexander prohibited the chase of the bison, of which, however, the only remaining to Europe is now to be found in Poland, and the adjoining Russian part of the Kingdom of Prussia. The other animals include the elk, roe-deer, wild boar, and brown bear, &c., the skins of which find their way to export.

Wool is more numerous and valuable than might have expected in an ill-cultivated country. They have 4 millions of sheep, and the principal raising districts are in the parts of Lesser and Greater Poland. There is said to be considerable quantities of sheep in the Kingdom of Prussia, and in the vicinity of Cracow and Lublin, and even in the Kingdom of Saxony. The quantity of wool is also used in the Kingdom of Saxony, and in the vicinity of Cracow and Lublin, and even in the Kingdom of Saxony.

Exports		Imports
Wool	10,000,000	10,000,000
Wheat	10,000,000	10,000,000
Barley	10,000,000	10,000,000
Oats	10,000,000	10,000,000
Rye	10,000,000	10,000,000
Flax	10,000,000	10,000,000
Linseed	10,000,000	10,000,000
Oil	10,000,000	10,000,000
Wine	10,000,000	10,000,000
Beer	10,000,000	10,000,000
Spices	10,000,000	10,000,000
Drugs	10,000,000	10,000,000
Metals	10,000,000	10,000,000
Textiles	10,000,000	10,000,000
Other	10,000,000	10,000,000

During the revolution the exports decreased greatly, while the imports were considerably augmented, from that period, however, the balance has been in a great measure restored. England, Holland, France, and Prussia, these were America, take all, through Danzig, most of the goods which Poland has to export. But in years when prices are high in England, and when, consequently, there is a great demand for corn in Prussia, a great deal of the supplies brought to that port come from Galicia. The quantities and values of exports produced in 1840, 1841, and 1842, are as follows:—Grains are exported in summer by heavy waggons, and in winter by sledges, but the roads are generally bad, and during the late winter months were much cut up; latterly, however, government has been exerting itself for their improvement. Goods destined to be sent to the interior, and merchandise is at present forwarded down the rivers by the best suited boats to the Prussian ports. But Prussia seems to be endeavoring to put a stop to the intercourse between Poland and the Prussian ports on the Baltic, by constructing a great commercial road from the S.W. angle of Poland to the Baltic, and a railway has been planned, for which the capital is already subscribed, and the works begun to connect to the harbor of Vistula and Lissa the goods which formerly went to Thorn or Memel, or by the Prussian railway. A similar purpose is served by the canal of Angermünde, connecting the Havel and Vistula with the Humber, and which is to be continued to the Baltic by the Vistula Canal, to the port of Vistula. The canal of Angermünde is 100 ft. in length from 1 to 2 ft. in depth and of sufficient breadth for two large boats to pass each other with ease. It has 17 locks and several submersible locks in different parts of its course. It was nearly completed between 1840 and 1842, and is now the scene of an active traffic. There, however, are all various and considerable measures, and can have no useful or permanent result. No one can take up a map without being struck at a glance that the Vistula is the proper highway of the country, and Danzig her proper shipping port.

Commerce in Poland is kept in order, freedom, and order, the State is about 100,000,000 of florins. The Polish State is about equal to 14 in 100,000,000, the dis-

Previously to 1801 Poland had its own laws, those of the despotic and the unhappy attempt at a revolution that Russia has suppressed those charters, government nearly in the same way as the of the empire. The council of administration consists of 5 directors general (justices and finance), a confidential minister appointed by the sovereign. The council are nominated to the emperor by a majority of state for Poland residing in Petersburg. There is also in that capital a department for Polish affairs established since 1803, to which the government of Poland is confined. The legislative power is vested in the sovereign and the proposed laws for this kingdom are submitted for his sanction by the Russian council of state. The local administration is exercised by civil governors, with the same powers as those established in the different parts of Russia.

The civil and commercial codes at present in force are, for the most part, the same as in Prussia. The criminal code is modeled on that of Prussia and Austria. Personal and religious liberty are completely guaranteed, and those who do not interfere with politics are as secure in Poland as any where else. But those who wish to stir up the country must have a care not to find any fault with any action of the government. The press is under the control of censors, who are districts have their own in Russia. Justice of the peace decides in civil cases up to the amount of 100 florins; above which the trial

come before the tribunals of original jurisdiction in the caps. of the several governments. At Warsaw, besides a court of appeal, there is a supreme court of cassation, and commercial tribunals are established in all the principal towns. Criminal causes are tried in separate tribunals, of which there are 4 in the kingdom. Political offences come under the cognizance of a council of war, or a commission specially appointed.

Religion.—Until lately, upwards of 3-4ths of the Poles belonged to the Rom. Cath., or the United Greek church, the Greco-Russian communicants being but few in number. But of late the Russian government has, by every means, been endeavouring to shake the spiritual dependence on the court of Rome, not only of the Poles, but of the United Greeks throughout the empire; and its measures, in this respect, appear to have been attended with so much success, that, in 1839, from three to four millions of United Greeks, including most of those of Poland, had joined the orthodox Greek church. Until 1832, the Greco-Russians had no prelate in Poland; but at that period an archimandrite was appointed, who resides at Warsaw. The bishop of the United Greek church resides at Heline, in Lublin. The Rom. Catholics have an archbishop and eight bishops, nominated by the Pope on the recommendation of the Emperor of Russia; and the bishop of the government of Cracow exercises authority over the free city of that name, and its territory. There are a number of convents possessing territorial revenues; but the secular clergy receive a regular stipend from the government, the landed possessions formerly belonging to them being now public property. The parish priests, however, receive tithes, the amount of which is sometimes very considerable. The Lutherans and Calvinists, amounting together to about 220,000 persons, are principally Germans. There are a few Memnonites and Moravians, and some Mohammedans.

Public Instruction.—Previously to 1880, education was scarcely diffused at all, except among the nobility and upper classes residing in the towns, and the total number of persons receiving instruction at that period is said not to have exceeded 16,000, or about 1 in 260 of the pop. After the suppression of the insurrection, the schools were shut for several months, and when reopened, were organized upon the same plan as those of Russia. Private schools are subject to the same inspection on the part of the government as public schools. In 1834 there were, in all, 43,794 pupils in public and private establishments; and in 1839 the number, at 1,159 schools of all kinds, was estimated at 70,000, or 1 to every 62 individuals. (*Russia under Nicholas I.*, p. 188.) In 1838 an order was issued by the Russian government, directing that there shall be a teacher of the Russian language in every primary school; and that all children attending such schools shall be obliged to learn the Russian language: it was, also, at the same time, ordered that no individual should be employed as a tutor unless he possessed a testimonial signed by the proper authorities, certifying his ability to give instruction in the Russian language; and that no person unacquainted with Russian should be promoted to any civil or military employment.

This regulation, as was to be expected, gave much offence to the Poles, and has been the theme of much idle declamation in this and other countries. Russia, no doubt, wishes to secure her hold over Poland; and every thing that tends to Russianise the latter, and to give her people the same tastes, habits, and modes of thinking as the Russians, must necessarily contribute to this end; and we believe it will be generally admitted, that of all the means to bring about this consummation, the gradual substitution of the Russian for the Polish language will be one of the most effectual. If there were any rational prospect of Poland being able to emancipate herself from the yoke of Russia, one might regret the measure. But as there is no such prospect, the interests of both countries will be best promoted by their being, as far as possible, consolidated into one people.

The Polish army, which before 1831 amounted, in time of peace, to 35,000 men, is now amalgamated with that of Russia.

The Poles are a remarkably fine race of people, being well formed, strong, and active. In their general appearance, they are said to resemble the western Asiatics rather than the Europeans, and are, most probably, of Tartar origin. The gentry are haughty and brave, but, at the same time, frank and generous. The peasantry, however, bowed down by continual oppression, are cringing and servile; their whole behaviour evincing the state of abject servility from which they are now being emancipated. The nobility are very numerous in Poland, amounting at present to not less than 283,420 individuals. According to the old laws of the republic, the nobles were *terrigenes*; every person who possessed a freehold estate, how small soever, or who could prove his descent from ancestors formerly possessed of such an estate, and who had not debased himself (!) by

engaging in any sort of manufacture or commerce, was a nobleman or gentleman, the terms being in Poland synonymous. The gentry were all held to be equal to each other, the titles of prince, count, &c., which some of them enjoyed, not being supposed to add any thing to their real dignity. Under the republic, the nobility were every thing, and the rest of the people nothing. The former were the absolute lords of their estates, and of the boors by whom they were occupied. They enjoyed the royal privilege of maintaining troops, and constructing fortresses; and they only could elect the sovereigns. No noble could be arrested without previous conviction, except in cases of high-treason, murder; or robbery on the highway; and then only provided he were taken in the fact! His house was a secure asylum to all to whom he chose to extend his protection, whatever might be their crimes. Even his vassals could not be arrested, nor their effects seized; they were exempted from all payment of tolls and other direct duties; and though the king might bestow titles, he had no power to create a nobleman or gentleman, that being the exclusive privilege of the Diet. Happily, however, this state of things has been wholly changed. Under the vigorous governments of Russia, Austria, and Prussia, the oppressive privileges of the nobles have been suppressed; they can no longer trample with impunity on their inferiors, nor commit offences without subjecting themselves to the full penalty of the law; and a poor gentleman no longer considers it a degradation to engage in some department of industry. (Busching, *Introduction to Poland*, § 4.; Malte Brun, *Tableau de la Pologne*, 266.; Coxe, i. 102., &c.)

Though modernised in a considerable degree, the richer Polish nobles continue to live in large castles, in a state of rude hospitality, entertaining great numbers of their dependants and such strangers as may happen to visit them. At these feasts the practice of sitting below the salt is still kept up, the best dishes and the best wines being appropriated by the *élite* of the guests.

Jews are more numerous in Poland than in any other European country, having amounted, in 1838, to 411,307 individuals, of whom 338,577 lived in towns, and 72,630 in villages, or in the country. They are, as already stated, in the exclusive possession of the commerce of the country; they, also, are the great manufacturers and sellers of spirituous and fermented liquors; advance money on lands and goods; are the only jewellers and silversmiths; and carry on all pecuniary dealings. Those in the towns are mostly all burghesses; and they may be said to engross all the most lucrative businesses. But notwithstanding all this, the majority of the Israelites are extremely poor. They seem, also, to be in a lower state of civilization than any other class. Even the richer individuals, though they occupy the best houses in the towns, appear to care little for cleanliness or comfort; and the lower orders live in a state of filth and discomfort that would be intolerable any where else.

There are in Poland many instances of longevity, and, on the whole, the country may be said to be healthy; but the people are, notwithstanding, especially liable to endemical diseases, such as small pox and fevers, which frequently make great havoc. Among the diseases peculiar, or nearly so, to Poland and Lithuania, the *pléca polonica* is the most remarkable. This is a disease of the head, which terminates by affecting the hair, which it dilates, softens, and clots into one undistinguished mass. This disgusting malady spares neither age nor sex, gentry nor peasants, though it be more frequent among the latter than the former. Various theories have been formed to account for its origin: most probably it is occasioned by the bad water, unwholesome food, and filth of the people.

Poland suffered much from the outbreak in 1831, in consequence partly of the destruction of property, and partly of the proscriptions and oppressive measures which it occasioned. Within the last few years, however, the country has again begun to revive.

The municipal revenues of Warsaw amounted, in 1834, to 4,094,000 fl., an increase over their amount in 1829 of nearly one fourth; and the value of insured buildings, throughout Poland, in 1835, was estimated at 506,187,000 fl., being an increase of 112,304,000 fl. over that of the buildings insured in 1829. Population has increased still more rapidly; having amounted, in 1828, to 4,088,289, and to 4,398,962 in 1838. The old roads, also, have been materially improved, at the same time that several new ones have been undertaken; so that, on the whole, however depressed in some respects, the country is certainly advancing in improvement.

History.—The history of Poland commences from the 10th century. In 1129, Boleslaus, under whom Christianity had been introduced into the country, divided the kingdom among his four sons, which was the source of a lengthened series of civil wars, and of all sorts of disasters. At length these different portions were united under one sovereign, in 1296. The reign of Casimir the Great, which began in 1333, and terminated in 1370, is

most brilliant in the Polish annals; still, however, foundations were laid in it of that anarchy that destroyed the kingdom. Casimir, having no children of his own, and being anxious that the crown should devolve, at his death, on his nephew Louis, king of Hungary, in preference to the legitimate heirs, obtained, for that purpose, the sanction of a general assembly of the nobles, and Louis agreed to the conditions under which he offered him the crown (Koch, *Tableaux des Révolutions*, i. 284.); establishing, in this way, a precedent for like interference on future occasions. On the death of Louis the grand duchy of Lithuania was united to the crown by the marriage of Jagellon, its grand-duke, to the daughter of Louis, who had succeeded to the throne. The house of Jagellon continued to occupy the Polish throne for about two centuries; but at each change of a sovereign an assembly of the nobles or *diet* was held, at which the new sovereign was formally elected to the throne. On the death of the last of the Jagellons, in 1725, the throne of Poland became, substantially as well formally, elective, and it was called not a kingdom but a republic. Henceforth, on the death of a sovereign, the nobility or gentry repaired in vast numbers, sometimes the amount of 100,000, on horseback, and armed, with crowds of attendants, to a sort of camp in the neighbourhood of Warsaw, to elect his successor, who had to subscribe, and make oath to observe, the *pacta conventa*, the conditions under which he had been elected. These were such as to reduce the royal authority within the narrowest limits, to secure and extend the privileges of the nobility and clergy, and to perpetuate the degradation of the people, who, being slaves in the fullest extent of the term, were not supposed, in fact, to have any legal existence! The famous John Sobieski, the deliverer of Vienna, elected to the throne in 1674, was the last of the great monarchs of Poland. But in the latter part even of his reign the vices of the Polish constitution, and their fatal operation, became obvious; and they thence continued to increase in number and virulence till its total subversion. (See the *Histoire de Jean Sobieski*, by the Abbé Coyer, *passim*.)

Exclusive of the diets* for the election of the sovereigns, ordinary diets were held, at least, once every two years, at which all matters connected with the government of the country were discussed and decided upon. It is easy to see, from what has been already stated, that this form of government could not fail to produce great party contests and disorders, and that it must have afforded every facility to the surrounding powers for acquiring a preponderating influence in the diet. Probably, however, the abuses already noticed might have been repaired, but for the principle, if we may so call it, first introduced in 1652, that no decision could be come to upon any matter submitted for consideration, unless the diet were unanimous. Hence the singular and extraordinary privilege of the *liberum veto*, by which any single member of the diet was permitted to interfere his absolute veto, and, by doing so, could nullify its whole proceedings! And, which is even more extraordinary, this absurd privilege, which allowed the whim, caprice, or bad faith of an individual to prevent the adoption of any measure, however necessary and however generally approved, was, for a lengthened period, regarded by the Poles as the palladium of their liberties! (*Abrégé de l'Histoire du Nord*, li. 683.)

It is plain, from these statements, that latterly the whole powers of the state were engrossed by the nobles, or gentry, many of whom, though enjoying the same political rights and franchises as the others, were miserably poor. In consequence, corruption, intimidation, and such like arts had full scope in the Polish diets, particularly in those held for the election of sovereigns; and latterly the crown was, in fact, either sold to the highest bidder, or the election was decided under the influence of foreign force. And if, while the government was in this state of abasement, we bear in mind that the whole people, with the exception of the nobles or gentry, were slaves, on whom every indignity might be practised by their masters, it will be seen that there is but little to regret in the subversion of such a state of things.

Indeed, the only wonder is, that Poland was not sooner erased from the list of nations. Its partition had, in fact, been proposed by the Swedes in the reign of Casimir V., a short while previously to the election of John Sobieski, as the only method by which the disorders that agitated the country could be put an end to, and the inconvenience thence arising to the surrounding states be obviated. (Rühlhière, *Anarchie de Pologne*, i. 68.) But it was not till more than a century after that the first par-

tion was agreed upon, in 1772, by the emperor of Austria, the empress of Russia, and the king of Prussia, by which about a third part of the kingdom was dismembered, and added to the dominions of the partitioning powers! But it was not to be supposed that having once begun to share in so rich a spoil, these powers would rest satisfied with this acquisition. The pretexts for farther interference still continued undiminished. Poland, as before, remained a prey to all sorts of disorders, and the Russian ambassador, and not the king, was the real sovereign.

In 1791 the majority of the nobility and gentry then assembled in a diet, which had been made permanent, being desirous to raise their country from the miserable state into which it had fallen, and stimulated by the events connected with the French revolution, drew up the project of a new constitution on a more liberal and broader basis, abolishing the *liberum veto*, and making the crown hereditary, on the demise of the king, in the Saxon family. This constitution was accepted by the king; but the great bulk of the nation did not, and could not, take any interest in the change; and the government were wholly without the means of supporting the new order of things. Russia had little difficulty in fomenting fresh disorders; and the unfortunate Poles, with an imbecile sovereign, without forces, and abandoned and betrayed by their pretended allies, were again compelled to submit to a fresh dismemberment of their country.

Provoked by these repeated indignities the Poles, under Kosciusko, rose in rebellion in 1794. But their means were totally inadequate to the struggle in which they had engaged; after displaying prodigies of valour, Kosciusko was defeated and taken prisoner (10th October, 1794), and Praga, the suburb of Warsaw, being taken by storm, that city forthwith surrendered; and there being no longer any obstacle in the way, a dismemberment of the remaining territories of the republic took place in 1795, and Poland was finally obliterated from the map of Europe.

The powers who dismembered Poland had, in reality, nothing better to allege, in justification of their measures, than the robber's plea, that the power to commit an act makes it at once right and expedient! But, how objectionable soever the motives by which they were influenced, and how dangerous soever the precedent which they established, there can be no reasonable doubt that their measures have been decidedly advantageous to the great bulk of the Polish people. The vices inherent in Polish society were such that it is idle to suppose they could have been eradicated by any remodelling of the constitution. There was no middle class (or none worth notice) in the country; nothing between nobles, jealous of their rank and privileges, on the one hand, and newly-emancipated slaves, brutalised and degraded by a long course of oppression, on the other. To restrain the first within the limits prescribed by law, and to raise the second class, was a work that could only be undertaken by a powerful government, such as there were no means of forming out of native materials. It is to be regretted that Russia obtained the lion's share of the spoil; but even in Russian Poland the condition of the people has been very decidedly changed for the better; and in Austrian and Prussian Poland, the improvement in their condition has been signal and extraordinary.

The existing kingdom of Poland originated in the grand duchy of Warsaw, established by Napoleon in 1807. It was assigned to Russia by the Congress of Vienna, and obtained from the Emperor Alexander a representative constitution. Unfortunately, however, the disgust occasioned by the brutality of the Grand Duke Constantine, commander-in-chief of the Russian forces in the kingdom, conspiring with the excitement produced by the French revolution of 1830, and the abuse of Russia in intemperate and ill-judged speeches in the H. of C. and Ch. of Dep., which made it be believed that England and France were ready to assail that power, precipitated the Poles into an insurrection. The result was such as all men of sense anticipated from the outset. The Poles made a gallant stand in defence of their liberties; but in the end every vestige of their independence was totally destroyed. The name of the kingdom remains; but its peculiar privileges have been subverted, and it is now substantially and in fact a part of the Russian empire.

POL-DE-LEON (ST.), a sea-port town of France, dep. Finistère, cap. cant., on the Channel, 10 m. N.W. Morlaix. Pop. (inc. comm.) in 1846, 6,655. Though ill-built, it is clean, well paved, and remarkable for its antique edifices. Its cathedral, a structure of the 16th century, has some excellent carving; and a tomb, said to be that of the first Breton king. The church of Kreizker, built in the 14th century, has a spire 394 ft. in height, and one of the handsomest in France. (*Guide du Voyageur*.) St. Pol has some trade in cattle, horses, linen, hemp, &c., but to no great extent.

POLIGNY (an. *Castrum Olinum*), a town of France, dep. Jura, cap. arrond., on elevated ground, 13 m. N.E. Lons-le-Saulnier. Pop., in 1846 (inc. com.), 5,835. It consists principally of 4 long parallel streets, and is well

* The diets consisted, 1. of the senate, composed of the bishops, palatines, or perpetual governors of provinces, castellans, or governors of towns, and the grand officers of the crown; and, 2. of the *nuncios*, or representatives of the nobles, or gentry. These bodies did not, however, deliberate separately, but together; and, as will be immediately seen, they could come to no resolution without being unanimous.

Macus tillicus (highly valued as materials for furniture, canoes, &c.), the Chinese paper mulberry (*Morus papyrifera*), and the sandal-tree, the timber from which last is exported from the Sandwich Islands to Europe and China.

The fauna of Polynesia is characterised, like that of Australia and its surrounding islands, by the absence of beasts of prey, and, indeed, all the larger animals. Hogs, dogs, rats, and lizards were the only quadrupeds originally found on the islands. The native hog is different from the European breed since introduced, and has now almost disappeared: the present breed is reared in great numbers, and pork constitutes the favourite food of the natives. The flesh of the dog is also esteemed a luxury, especially by the Sandwich Islanders. Rats were occasionally eaten uncooked by the Friendly Islanders; but that practice has been discontinued. Cats have been domesticated in most of the houses. Horses, asses, horned cattle, goats, and sheep have since been added, and thrive exceedingly well. The oxen are a fine breed, chiefly imported from New South Wales. The horses come from S. America, and, being used only for the saddle, are never shod. Among the indigenous water birds may be noticed the albatross, tropic bird, several kinds of petrels, herons, and wild ducks. Woodpeckers, turtle-doves, and pigeons are common; besides which, the parroquet (of the species *trichoclossus*) is abundantly distributed over all the islands; and in most of them the domestic fowl and several species of wild fowl appear to be indigenous. Fish are numerous on the coasts and in the lagoons of all parts of Polynesia: the albacore, bonito, ray, and shark are eaten by the natives; in addition to which the shores abound with a great variety of delicate rock-fish. The freshwater streams also swarm with salmon, eels, &c., and many varieties of molluscous crabs, &c., with turtles, are caught on the coral rocks. Among the whales that frequent the coasts of Polynesia, the largest and most valuable is the *cachalot*, or sperm-whale, the male of which, according to Mr. Bennett, sometimes yields from 70 to 90 barrels of oil, and about 15 barrels of spermaceti, the Cape-whale, hump-back, and black-fish; besides which, porpoises and other small cetaceous animals are extremely abundant. (*Ellis's Polynesian Researches*, i. 30—77.; *Moerenhout*, i. 367—381.; *Bennett's Whaling Voyage*, i. 36., and append.)

Polynesia has, of late years, been much visited by Europeans, partly curious to inquire into the habits of people differing essentially from those of the rest of the world, and partly anxious to communicate to them the arts of civilization and a knowledge of the Christian religion. Its isolated inhabitants were found to possess many interesting features of character, but at the same time to be plunged in the grossest barbarism, sensuality, and idolatry. Cook traced among some of the Islanders a confused notion of a supreme intelligent Deity; but they almost exclusively worship a number of inferior gods, particularly marine and aerial deities, lemons, birds, and fishes. Their rude idols were supposed to exercise a powerful influence; their temples were polluted with human sacrifices; and divination, witchcraft, &c., were practised by the chiefs as political engines for overawing their subjects. (*Ellis's Pol. Researches*, i. ch. 13, 14.) At the same time, morality, as understood by Europeans, had no existence among this wild people, and the grossest animal appetites had full way, their gratification being encouraged, also, by their religious institutions. The law of the strongest prevailed: fierce and bloody wars frequently took place between the different insular tribes on the most trivial pretext, and conquest was generally followed by acts of the most horrible cruelty, including the extermination of the vanquished tribe, and occasionally even an indulgence in cannibalism. The female sex, too, was found as licentious, degraded, and oppressed a state as in the wildest districts of Africa. A kind of civil marriage appears to have been generally observed; but as the sex was too much disposed to allow the existence of affection, the wives were repudiated on the slightest pretext, or else neglected for more fascinating concubines. Polygamy was common in nearly all the islands, and in some groups it is still prevalent. Moerenhout, indeed, tells us, though the statement savours strongly of exaggeration, that some chiefs in the Fijee Islands have as many as 50 wives. (*Voyage au G. Océan*, iii. 68—69.) Female virtue was formerly wholly unknown; and notwithstanding the labours of numerous missionaries during upwards of 20 years, chastity is still, we apprehend, extremely rare. Sexual indulgences, and even infanticide, were encouraged by a singular institution called the Areoi society, the baneful influence of which appears to have been pretty generally diffused over the islands of the Pacific. The missionaries state that about two-thirds of the children born were destroyed by their parents; and notwithstanding the introduction of Christianity, the practice still prevails: but we are not disposed to attach implicit credit to these statements, which, no doubt, go far beyond the mark.

VOL. II.

Cannibalism is still practised in the Marquesas, and some of the other groups. The Islanders, however, do not live in the rude independence of savage life, but acknowledge the arbitrary sway of hereditary chiefs, whose power is controlled only by those subordinate to them in particular districts. Some attempts have been made to introduce governments of a more liberal character; but they have signally failed.

The habits of the natives are still in many respects those of barbarians. Their houses, almost without exception, are confined to a single story; usually, though not always, of oblong shape, and very simply constructed with stakes of the bread fruit-tree, driven into the earth for the purpose of supporting the roof, which is commonly thatched with the leaves of the *Pandanus odoratissimus*, or cocoa-tree. The framework of the walls is composed of bamboo or hibiscus rods, and a large portion of one side is open, being covered only at night with a kind of cloth curtain. The interior comprises only a single apartment, sometimes with a boarded floor; and the furniture consists simply of a few mats and cotton-stuffed pillows spread on the floor, a few low wooden stools, a trough and stone pestle for preparing their favourite paste called *poe* (made from the *Arum esculentum*), some cocoa-nut shells, used as cups, with a fishing-spear, and perhaps a musket. Bunches of fruit hang from the walls; and occasionally may be seen a sow with a litter of pigs occupying a space in one corner, railed off for her accommodation. A separate shed is employed for cooking; and in the more advanced islands a plot of enclosed ground, planted with useful vegetables or favourite flowers, surrounds many of the houses. (*Bennett's Whaling Voyage*, i. 100.; and *Moerenhout*, ii. 86—89.) Some of these huts are exceedingly large. Mr. Ellis mentions one belonging to a native prince that was nearly 400 ft. in length; and houses 100 ft. in length are by no means infrequent. (*Polyn. Researches*, i. 175.) The domestic habits of most of the natives are not only unsocial, but irregular, as respects refreshment and sleep, labour and amusement. Their meals are arranged according to their avocations or the supply of their provisions. They usually eat in the forenoon; but their principal meal is in the evening, when, if well supplied, they eat to excess. They rise early, and go late to rest; but the men are often buried in sleep during many hours of the day, while every species of household drudgery is performed by the females, who are oppressed and degraded in the last degree. The habit of frequent bathing prevails throughout Polynesia, and the natives are remarkable for cleanliness, and most of them pay great attention to personal ornament: indeed, says Mr. Ellis, "their appearance on public occasions is in a high degree imposing." The hair, in particular, is regarded as an object of great attention by both sexes, and the females commonly appear in loose ringlets entwined with flowers. (*Researches*, i. 133—136.)

The dresses of the Islanders originally consisted of cloths woven by the women from the bark of trees, and wrapped loosely round the body, leaving a large part of it uncovered; but since their connection with Europeans, they have introduced a very droll *mélange* of native and European costume. The practice of tattooing the body prevails more or less through all the islands, though attempts were made a few years ago to abolish this barbarous custom in Otahete. Tattooing is performed during childhood; and in the Society Islands at the early age of 8 or 10. The patterns vary in the different groups; but nowhere is the body so extensively disfigured as in the Marquesas, the inhab. of which have a most hideous appearance. In some of the islands the face is left in its natural state, the legs, arms, and breast being the only parts tattooed. (*Moerenhout*, ii. 121—4.) The natives of all the best known groups, except the Sandwich Islands, are, like the half-civilised inhab. of most tropical countries, extremely indolent, having, in fact, little occasion for industry, owing to the abundance with which the fruits of the earth are spontaneously produced. Their principal employments are agriculture, fishing, canoe-building, and the manufacture of cloth. Agriculture, as previously observed, is in the rudest state that can well be conceived, the only tillage that the earth receives being by a rude iron-shod stick, about as broad as a European chisel. Fishing is a far more favourite employment, and the methods used are numerous and sometimes highly ingenious. The fish are sometimes caught in circular fences, built up in the shallow parts of their lakes, and simply taken out with a hand net; these enclosures are also excellent preserves for fish not wanted for immediate use. Large nets, made of the twisted bark of the hibiscus, are used for fishing salmon, herrings, &c.; and on most of the islands the natives exhibit a surprising dexterity in the use of the fishing spear. In fact, nowhere are there more skilful fishermen; and considering that before their intercourse with Europeans they were entirely destitute of iron, their variety of fishing apparatus was astonishing. The situation of these Islanders necessarily imparts a

N n

warlike character to their habits, and much of their attention is, accordingly, devoted to the building and improvement of their canoes. Their canoes are of various sizes, as well as shape, and are either double or single. The largest of these seen in the Society Islands are nearly 70 ft. in length with very high stems and sterns, but only 2 ft. wide. Those used to war are between 30 and 40 ft. in length, broad built, of rather straight shape, highly ornamented with carving, and when in use decorated with gay coloured flags and streamers. In the double canoes, which are merely single canoes lashed together, planks are thrown across to form a kind of deck for the accommodation of passengers, and over it is sometimes spread an awning of painted mats or bark. The paddles, made of the buttress, are not heavy, but as they are used alternately on each side of the boat, the labour of rowing is by no means insupportable. The canoes used in fishing on the coast are single and are extremely the elongated triangle of form. They contain every more than two persons. Many of the canoes have innovative masts, which are only raised when the sails are used. The latter of which there are sometimes two, but more frequently only one to each canoe, are made with mastings of the pandanus bent to the shape of a half oval and the rigging is of the simplest description. On the whole, the canoes of the Society Islands are decidedly superior to those of the other groups, even of the Sandwich Islands, are large and strong, but less elegant than used in most of the other islands are of smaller size and less skilfully constructed. The dexterity of the natives in managing these fast boats when out of use is also perhaps unparalleled among the habits of savage nations. (Edin. J. 1820, 170.)

The manufacture of cloth, which is more or less useful on in all the islands, is almost exclusively confined to women, the materials commonly employed being the inner fibre of the bark from the trunk of the bread-fruit tree. These fibres, after having been separated are beaten on a long board with a grooved mallet the fibres from which come the great fibres to intertwine with each other and to assume the appearance of woven cloth. By this process being so continuous made consisting upwards of 100 yds. of cloth, 4 yds. wide. The colour of the unadorned cloth is a dusky brown, but it is always either bleached or coloured with vegetable dyes. As to the manufacture of this cloth was formerly highly prized by natives of all ranks, but since the introduction of European cloth it has been made to great smaller quantities, and its use in the Sandwich, Society, and Friendly Islands, is now confined chiefly to women, children and the lower classes. The missionaries tried to introduce the worst cotton, but with little success, and give abandoned. A kind of doria in some of the islands from the bark fibres these fibres being either in or were as mention on the bark. In this last article the texture of it except all others. A coarse kind made of palm leaves, for building, as

As respects foreign trade, it may be said to be unknown in these islands till a treasure is chiefly kept up by the ships and the number of vessels in which islands they average about 40 annually. Trading intercourse has made the islands aware of the value both of goods and money, and hence, hitherto, and hence have wholly lost their former commercial value.

Many of the islands of Polynesia are of a lively and amiable disposition, when not employed in the grove pursuits of fishing, canoe-building, or war they give themselves up with great ardour to a variety of amusements, among which dancing is, perhaps, the most prominent, being common on all occasions, not merely of pleasure, but also of religion and state ceremony. Some of these dances are stated by the missionaries to have been very objectionable while others were of a graceful and more dignified character. The exchange of a Christian profession for a detesting polytheistic history has diminished the frequency of these exhibitions, though they still occasionally take place. The limited intercourse of the islands consist of a long narrow drift, a tropical forest of a species of chestnut into which is inserted a bamboo cane for a smooth stem, and a hole of bamboo, about 10 inches long and about 1 inch in diameter. Boating and rowing, even, used to be favourite amusements, but these exercises, as well as many other national amusements, have been all but abandoned since the introduction of Christianity, though there be, after all, but too much reason to suppose that the efforts of missionaries have produced little real change for the better in the morals of the mass of the people.

The language of the Pacific, as respects physical character may be divided into 3 distinct classes. The most distinct tribe is composed of Papuan negroes, who are distinguished by darkness of skin, smallness of stature,

and black woolly or curly hair. They chiefly inhabit the Admiralty Islands, New Britain, New Ireland, New Hebrides, New Caledonia, and the Solomon Islands. The other tribes, which is far more widely dispersed over the numerous groups of this great ocean, exhibiting many of the features belonging to the Malays and aboriginal Americans, but in some respects so different as to form a separate and intermediate race. The people of each cluster are distinguished by their complexion. The tribes of the Society Islands are of good stature, and well made, of olive complexion, with eyes, proportionally large, with a dark angle or perpendicular as in the European head, a bright, full and jet-black eye placed under well-arched eyebrows, a straight or slightly concave well-formed mouth, and moderately high forehead, with straight though not very tall, either black or brown. The Sandwich Islands have more firm and muscular limbs, but in other respects bear a close resemblance to those just described, and they are generally active in their movements, graceful and steady in their gait, and perfectly unacquainted in their address. With some talents for navigation in advanced life. It is remarkable, also, that the chiefs and persons of extraordinary rank, throughout the islands, are almost without exception superior to the common people in strength, dignified appearance, and physical strength indeed so great is the difference, that distinguished and others, have supposed them to be a distinct race, whose mixture at some remote period had brought the aborigines into present existence. (Edin. J. 1820, 170-81; and Macdonald, 2, 337-340.)

With respect to the language of Polynesia, Marsden first ascertained that there is one general language prevailing the whole of the South Sea Islands, and extending, with some different dialects, from the 2 Indian archipelago to the 2 extremity of the Polynesian group. "Indeed," says Mr. Marsden, "it is impossible to avoid observing the close analogy between the dialect spoken in the many different islands. In striking a similarity to those between the languages of the Society Islands and New Zealand, that the natives mutually understood each other the habits of the Sandwich, Marquana, and Society Islands converse after only a few days practice, and the converse even of the far distant Easter Island are intelligible to the whole of the other islands both N. and S. of the Equator. It has been believed by some linguists that all these dialects are variations more or less, of the Malay language; and many words certainly bear some analogy to those in the Malay vocabulary, but, in fact, there is no living language either of Asia or America, which can be demonstrated the parent stock of the great Polynesian language. (Crawford's Indian Archipelago, 2, 33-34; Macdonald, 1, 336-340.)

The Caroline Islands (comprising called the New Philippines) extend over about 10 deg. of longitude, and are divided by Captain Laidlaw into 6 groups, comprising several hundred islands a few of which are high and rising to peaks but by far the greater number are low, and mostly of coralline formation. They were discovered in 1588 by a Spaniard, who named them after Charles II., king of Spain. The productions of these islands are very similar to those of the Sandwich and Society Islands; but the bread fruit is found only in a few of the groups, and the bay is wholly absent. Hence these islands are chiefly on fish. The islands are reported to be the most important culture and fisheries of Polynesia, and, notwithstanding the misapprehension as to which they are surrounded, they have a considerable trading intercourse in commerce with the Ladrone Islands and the 2 archipelagoes.

The Sandwich Islands (10 in number, of which 6 are inhabited) form a group many hundred miles distant from all the rest. The area of the largest island, Owhyhee, or more properly Hawaii, is estimated at 1,400 sq. m. being more than half that of the entire group, and is, indeed, by far the largest island of Polynesia. It rises to high and towering summits to an elevation of nearly 14,000 ft. from the sea, and yet only to the gigantic volcano of Kilauea, with its immense crater 5 m. in length by nearly 3 m. in width, and several hundred feet deep, by a constant mass of terrific confusion, but the whole island is one complete mass of lava, and being perforated with numerous openings in the shape of craters, may be considered as forming a hollow cone over a vast hollow in the heart of a crystalline subterranean mountain. (Edin. J. 1820, 170.) The group of the Sandwich Islands are situated, in fact, at about 2,500 ft. The natives are of a darker complexion than those in the Society Islands, the islands have more and dissipated features, and both sexes are plump and rounded. The natives generally are remarkable for their attention to the arts of industry, and have distinguished themselves above all others by their efforts to introduce European civilization.

Continually was introduced by the American missionaries in 1820, and is now the religion of the mass, although

have been of forms of real European costume of closely resembling, in the 18th W., is the pop., of which are built of their huts. The harbours single open 40 vessels can attract considerable ships in the California, sp., and which were then national in is a station engaged in early been the ground English of hotels, boats it is a curb increasing exceed a discovery.

of the extraordinary demand for agricultural produce by the foreign vessels frequenting their ports, to bring settlers from China to supply this deficiency. In 1846 about 800 vessels touched at the islands. The value of the exports of articles of native produce, in 1844, was estimated at 100,000 doll., but it must now be much greater. The natives have several ships, and others are owned by the foreigners in the islands. The government is a limited monarchy, with two chambers.

Captain Cook, who, after Columbus, ranks as the greatest of modern discoverers, was killed in a collision with the natives of Owhyhee on the 14th February, 1779.

3. The *Society Islands* consist of 6 larger and several smaller islands. The principal of these, called Otaheite or, more properly, Tahiti, is 108 m. in circ., and has a pop. of about 7,000. It is extremely mountainous, some parts attaining an elevation of nearly 7,000 ft.; but "extensive as well as fertile vales open on every side towards the sea, and the entire land is clothed from the water's edge to its topmost heights with a perennial verdure, which for luxuriance and picturesque effect is certainly unparalleled." (Bennett, l. 63.) Next in importance to Tahiti, and about 130 m. N.W. that island, is Ulietea,

producing figs, nutmegs, and oranges, besides the fruits common to the rest of Polynesia. The inhabs. present about the most ugly specimen extant of the Papuan race: the men live almost in a state of nudity; and the women, who are used as mere beasts of burden, wear only a petticoat made from the plantain-leaf. Their canoes are more rudely fashioned than in most of the other islands; and on the whole, these people seem to be among the

same century by Mendana and other Spanish navigators. The Dutch made further discoveries in the 17th century; but to England mainly belongs the honour of having explored and laid down the exact position of the principal groups of the South Sea islands, and the names of Byron, Wallis, Cook, Vancouver, and Beechey, must ever rank high in the estimation of geographers: great credit is also due to La Pérouse, D'Entrecasteaux, Freycinet, and other learned navigators, sent out on exploring voyages by the French government. In consequence of the labours of these and other navigators, aided also by the information gained from missionaries resident in the islands, we have gained a pretty intimate acquaintance with the condition of the natives in the principal groups of Polynesia, but there remains a great number of islands, especially on the W. side of the Pacific, that have very seldom been visited by Europeans, and are occupied by people as savage and uncivilised as the Sandwich Islanders of the last century.

POMERANIA, a large prov. of the Prussian states, lying along the S. coast of the Baltic, from long. 12° 20' to 16° 7' E., having E. and S. West Prussia and Brandenburg, and W. Mecklenburg. Its form is oblong, its length (from E. to W.) being above 200 m.; while its breadth varies from 30 to 60 and 80 m. Area, 12,179 sq. m. Pop. in 1846, 1,168,072, of whom 1,145,939 were Protestants. It is divided into three regencies, and these again into 26 circles. Surface flat. Principal towns, Stettin, Stralsund, Greifswald, Stargard, Stolpe, &c. Principal rivers, Oder, Laba, Stolpe, Rega, Persante, Ucker, Peene, and Inna. The Haff is a large bay, or rather lagoon, of an irregular form, which communicates with the Baltic by the mouths of the Oder. Along the sea the land is in many parts so low that it would be overflowed, were it not protected by ranges of sand-hills, and where these are wanting, by dykes, as in Holland. Soil mostly sandy, and unproductive, except along the rivers and lakes, where it is marshy and comparatively fertile. A large part of the country is covered with forests and heaths, and there are also many shallow lakes. Agriculture is in a very backward state; but

4. The *Marquesas*, which were discovered by the Spaniards in 1593, consist of 13 islands, extending about 10 m. from N.W. to S.E. The largest, Nukihiva, is about 1 m. in circ., and is the only one generally frequented by shipping. The coast-scenery is neither picturesque or inviting, its principal features being black naked hills and barren hills; but in the interior are many fertile vales, and very picturesque scenery. The inhabs., with regard to personal beauty, are superior to most of the Polynesian tribes; and the women, though short in stature, are well-proportioned, and sometimes very handsome. In civilisation, however, they are far behind the Sandwich Islanders; and are generally characterised by covetousness, irascibility, love of revenge, and gross sensuality. Cannibalism was practised by them within a very recent period; and they have steadily resisted all attempts to convert them to Christianity. Polygamy, however, though not forbidden by law, has fallen into disuse.

since the abolition of vassalage in 1811, it has made considerable progress. Wheat and barley are grown; but rye, buckwheat, and oats, are the principal corn crops; potatoes are largely cultivated, and form, indeed, a principal part of the food of the people; flax and hemp are also grown, with tobacco, &c. The breeding of cattle, sheep, and hogs, is a favourite occupation. Geese are reared in immense numbers; and besides those consumed in the province, large quantities are exported smoked and dried. Very few farms are occupied by tenants holding under a lease, but are chiefly farmed by or on account of the proprietors. The peasantry live in mean dirty cottages of wood or clay; their clothes are all of home manufacture. Common agricultural labourers earn from 6 to 8 silver groschen a day, exclusive of subsistence. Minerals unimportant. The woollen manufacture in a domestic state is pretty generally diffused; and linen, leather, &c., are also produced. There are numerous breweries and distilleries, and dram-drinking is as prevalent here as in other parts of the monarchy. The fishery, particularly of sturgeon and salmon, is carried on along the coast, and in the creeks and rivers.

POMONA, one of the Orkney Islands, which see.

POMPEII (called by the Greeks *Pompeia*), a long-buried city of ancient Italy, in Campania, not much celebrated in ancient history, but now an object of the greatest interest in consequence of its rather recent discovery and exhumation. It was originally close to the sea; but it is now nearly 1½ m. inland, and is about 5 m. S. by W. the crater of Vesuvius, and about 15 m. S.E. Naples. The æra of its foundation, as well as the greater part of its early history, is involved in obscurity; but the presumption is, that it was settled by Osci and Pelasgi prior to the establishment on this coast of the Greek colonies from Eubœa. About anno 440 B. C. it fell into the hands of the Samnites, from whom it was taken, with their other possessions, by the Romans about 80 years afterwards. Pompeii revolted, with the other Campanian towns, during the Social War; and little more is known of it till it was visited by an earthquake (A. D. 63.), which occasioned great devastation. *Motu terræ, celebre Campaniæ oppidum, Pompeii, magna ex parte proruît.* (Tacit. Annal. lib. xv. cap. 22.) The repairs consequent to this disaster were incomplete, as is seen by the state of the excavated ruins, when the city, with Herculaneum, Stabiae, and other towns in its vicinity, was wholly overwhelmed by an eruption of Vesuvius A. D. 79. This tremendous calamity has been admirably described by the Younger Pliny, whose uncle was one of the sufferers, in a letter to the historian Tacitus:—"Præcesserat per multos dies tremor terræ, minus formidolosus, quia Campaniæ solitus; illâ verò nocte ita invaluit ut non moveri omnia sed everti crederentur. Mare in se resorberi et tremore terræ quasi repelli videbamus. Certe processerat litus, multaque animalia maris in siccis arenis detinebat. Ab altero latere nubes atra et horrenda ignei spiritus tortis vibratibusque discursibus rupta in longas flammarum figuras dehiscibat; fulgoribus illæ et similes et majores erant. . . . Mox audires ululatus feminarum, infantium queritatus, clamores virorum: alii parentes, alii liberos, alii conjuges vocibus requirebant, vocibus noscebant: hi suum casum, illi suorum miserabantur: erant qui metu mortis mortem precarentur. Multi ad deos manus tollere. Nec defuerunt qui fictis mentitisque terroribus vera pericula auferant. . . . Mox dies verus, sol etiam effulsit, luridus tamen:—occurrebant trepidantibus adhuc oculis mutata omnia, altoque cinere tanquam nive obducta." (Plin. Epist. vi. 20.) It seems probable, however, from the small number of skeletons discovered, here and at Herculaneum, that the inhabs. of both cities not only found time to escape during the confusion, but also to carry with them their most valuable effects.

From this time forward, for about 1669 years, Pompeii continued buried under the ashes, pumice-stone, and other volcanic matter by which she had been overwhelmed, and even her situation was matter of doubt and conjecture. It is surprising, however, that her ruins did not sooner attract attention; for, in 1592, the celebrated architect and engineer, Domenico Fontana, having been employed to construct an aqueduct to convey water to Torre, fell in with the remains of the buried city. But this discovery appears to have attracted little or no attention; and it was not till 1748, that peasants employed in cutting a ditch fell in with the ruins of the city, that they became an object of interest and attention. The excavations were commenced in 1755; and have since been pretty constantly, though not very vigorously, prosecuted. Not having been overwhelmed by lava, but with tufa, ashes, and scorise, the excavations are much more easily effected here than at Herculaneum. (*Description de Pompeii, par Bonucci, p. 31, &c.*)

Pompeii, to borrow the words of an intelligent observer, is "the most wonderful of the antiquities of Italy; and it is perhaps the only one which never disappoints a traveller who is even moderately acquainted with the history of ancient Rome. The impression which

it gives of the actual presence of a Roman town, in all the circumstantial reality of its existence 2,000 years ago, is so vivid and intense, that it requires but a small effort of imagination to place yourself among the multitudes which once thronged its streets and theatres, and occupied its now voiceless chambers. The expression so often used, that you expect to see the inhabitants walk out of their houses to salute you, is scarcely a figure of speech. Many things, in fact, concur to foster the illusion. You see a street before you carefully paved and well worn, and bordered with *trottoirs*, in good preservation, as if it had been in use on the preceding day. The houses generally extend in unbroken lines, and even the dilapidation is in some measure concealed by the small modern roofs placed over the walls to protect them from farther waste by the weather. The doors and windows, indeed, are all open; but so they generally are in the modern houses of Italy; and the sombre brown tints of the walls is not very different from what is seen in the decayed towns of the same country at the present day. You turn to the right and the left, and wander from street to street, and still you have the perfect image of a town before you, except that no inhabitants appear, and these you may suppose have only left it a few days before. We have detached public buildings of many kinds elsewhere; but here we have a Roman forum, with all its accompaniments of temples, porticoes, curiæ, &c., not indeed perfect, but only so injured that what is missing can be replaced, and what is mutilated restored. We have also many shops, with their utensils of trade in them, and about a hundred private houses of all descriptions, from the poor cottage to the patrician mansion, enabling us, for the first time, to obtain a distinct idea of the form and arrangement of a Roman house, and giving us, as it were, a glimpse of the domestic life and manners of the people. The public baths here, which were almost entire, have thrown new light on the structure of those buildings. Lastly, the *tout-ensemble* of the walls, gates, streets, forum, houses, temples, fountains, theatres, associated as they are with each other, give us a conception of a Roman town incomparably more clear and satisfactory than any number of such objects scattered over distant localities could have furnished." (*MacLaren's Notes*, p. 100. 103.)

It seems evident on an examination of the superincumbent strata, which consists of various layers, that intervals had taken place in the original eruption, which lasted for three days; and it is farther probable that some of the uppermost layers may have been the result of subsequent eruptions.

This resuscitated city, of which about 1-4th part is now laid open to public view, is of a somewhat oval form, ½ m. in breadth and ¾ m. in length, covering an area of 160 acres, or about 2-3ds of the new town of Edinburgh; and considering the narrowness of the streets, the nature of the houses, and the mode in which the slave population generally were lodged, the entire population could scarcely have exceeded 25,000 inhabitants. The walls, which have been traced on every side, except towards the sea, are about 20 ft. thick, and nearly equally high, being faced with blocks of lava inside and outside. There are six gates, and many towers, rising high above the ramparts, and pierced with arches. The best approach to Pompeii is by the Applan way to "the Gate of Herculaneum," which is nearest the sea, and at the N.W. angle of the city. Along each side of the road, approaching this gate, extends a line of tombs, many of which remain perfectly entire, their angles being as sharp, their inscriptions as legible, and their whole appearance almost as fresh as if they had been erected only a few years ago. The monuments vary greatly in size, pattern, and material: many are mere cenotaphs, while others have niches for urns; and a pretty common form is that of a small oblong temple, adorned with columns or pilasters. On the whole, these tombs are not unlike the more ambitious monuments in our own churchyards; but there is nothing resembling our single upright alabs, or flat gravestones. The gate of Herculaneum consisted, like the others, of a large central and two smaller side-gates, not unlike those of Temple Bar in London, the central archway being about 20 ft. in height and 15 ft. in width. The streets appear to have been arranged pretty regularly in parallelograms; but they are very narrow, the most usual breadth being 18 or 20 ft., of which 1-3d is occupied by the trottoirs, which invariably line both sides of the horseway. An exception, however, must be made in favour of the "Street of the Silversmiths," which is 40 ft. in width, and decidedly the finest in Pompeii. The middle of the road is paved, like the Via Appia, with masses of lava of irregular shapes, and from one to two ft. in diameter, the most level surfaces being placed uppermost; and in many parts the ruts produced by the wheels are still obvious. The trottoirs, which are raised about 10 inches above the rest of the street, average about 4 ft. in width: they are generally made of a sort of compound of lime, earth, and

avel, not unlike the asphalt used for modern pavements in London and Paris.

The largest excavated space in Pompeii, and that which exhibits most architectural magnificence, is the Forum, an extensive oblong area, once paved with large slabs of marble. The feelings of a classic traveller, on holding, for the first time, such a monument of antiquity, are well described by Mr. Maclaren. "I felt at it was not a trifling incident in my life, to stand in the venerable Roman forum. There it lay distinctly before me, rifled of the greater part of its marble pavement, of its statues, and some of its columns, yet retaining enough of its ancient lineaments, to give a perfect idea of its form, extent, and distribution of its parts. It had been terribly injured by the earthquake A.D. 63, and was rebuilding, when the great catastrophe occurred. The forum was the great place of public resort: the people came here to inquire after news, the busy to talk of business, friends to keep appointments, patrons to meet their clients, suitors to attend the courts, candidates for office to solicit votes; here the orators harangued, and the people shouted, the magistrates met in council, and the tax-gatherers collected the revenues: here the decrees of the senate were promulgated *viva voca*, and the laws, festivals, and gladiatorial shows, were advertised in short notices badly spelt, painted on the walls in crudely formed letters." (P. 131.) The entrance from the W. corner, (that nearest the gate of Herculaneum), by a flight of steps leading downwards through a brick arch into an oblong area about 490 ft. in length by 114 ft.

width, "surrounded by columns, and the ruins of temples, triumphal arches, and other public edifices, the remains of which can in general only be conjectured. The red masses of brick divested of their marble casings, the brown and yellow tints of the tufa, the fragments of white stucco attached to the shattered walls of the different edifices, and the pedestals which once supported statues in honour of illustrious patriots, are all that now remain to attest its former beauty and magnificence." (*Pompeii, Library of Entertaining Knowledge*, i. 100.)

A Doric colonnade ran round three of its sides, and the fourth was occupied by a temple of Jupiter. The columns formed a species of covered gallery, raised above the central area, and a second row of smaller columns, placed on the top of the first, formed a second gallery, which would afford a view of every thing passing in the area. The temple of Jupiter has a prostyle portico, supported by 12 very beautiful Corinthian columns, and a total length, from the front steps to the back wall of the cella, is 120 ft., the uniform breadth being 45 ft. On the W. side of the enclosure stood the prisons and public granaries, a peripteral temple of Venus, having a façade looking southward, of nine Corinthian columns, and a Basilica, or court of justice, which is the largest building in Pompeii. It is oblong shaped, 220 ft. in length by 80 ft. in breadth, and is entered through a vestibule having five door-ways of masonry. The roof of the interior was supported by a peristyle of 28 Ionic columns, and at the further end are some remains of what was once the prætor's tribunal. At the end of the Forum, which was also ornamented by a triumphal arch, are the remains of three buildings of nearly equal size, and similar shape, that may have been tribunals, or places of assembly for the magistrates: these, however, are of very confined dimensions, and possess little interest. On the E. side, opposite to the Basilica, and flanked on one side by the Street of the Silversmiths, is a large enclosed building, in the shape of a parallelogram, within which was an oblong peristyle of white marble Corinthian columns; it is commonly called the *Thalæidicum*, and was built by Eumachia (whose statue is still standing), but its former use seems to be quite conjectural, though Gell and Donaldson seem to think, from some of the pictures and other remains found there, that it may have been a kind of cloth-hall. Adjoining it, and fronting the forum, is a small temple of Mercury, in the court of which is an altar of white marble, beautifully sculptured in bas-relief, representing a sacrifice. What the next building may have been is very doubtful; but as it has an altar, without a cella, we incline to think that it may have been a *senaculum* or hall of meeting for the town-council. Lastly, the space close to the N.E. angle of the forum is occupied by a very large enclosed peripteral structure, supposed to have been a pantheon dedicated to the twelve *Dii Consentes* of Roman mythology, and comprising, besides an *adida* or raised chapel, numerous cells for the accommodation of the priests. Under the colonnades of the forum, close in front of the Pantheon, the entrance to which is by a rather narrow vestibule, are the remains of seven recesses or shops, in some of which the pedestals of the tables are still visible; these may possibly have been the *tabernæ argentariæ*, common in most Greek and Roman fora. (For further particulars respecting these several buildings, and the monuments contained in them, the curious reader is referred to the accurate and very instructive little

work on *Pompeii*, in the *Library of Entertaining Knowledge*.)

Next in importance to the excavation of the Forum, is that of the quarter occupied by the theatres. Its best approach from the Forum is by the "street of the silversmiths;" the space cleared comprises two theatres of unequal size, a square usually called the soldier's quarter, and two temples, with other buildings of minor importance. The theatres will not bear to be compared, in point either of size or splendour, with the magnificent structures at Rome; but still they have the remains of considerable beauty, and the largest, at least, would be considered of large size in any modern city. It has six entrances, leading to different parts of the building, and six inner doors, or *vomitæ*, opened on an equal number of staircases running down from the external circular corridor to all parts of the house. The benches were about 1 ft. 3 in. in height, and 2 ft. 4 in. in width, and it would appear that they may have been capable of accommodating about 5,000 males, chiefly of the middle classes; those of high rank sat on chairs in the orchestra, and the women occupied a gallery running round the top of the building over the corridor. All the benches as well as the orchestra seem to have been entirely covered with marble, of which, however, there are now but few vestiges. Like the Coliseum, and other ancient theatres, it was open at top; but on of the outside wall may still be seen the iron rings inserted to receive the masts supporting the awning. Of the scene itself, enough remains to show that the three chief doors were situated in deep recesses, and that behind them was the *postcenium*. The smaller theatre, which communicates with that last mentioned, is built on the same plan, and similarly arranged, having had accommodation for about 1,500 spectators; but, unlike the other, it seems to have been permanently roofed. Its shape, also, is rather elliptical than semicircular. Close to the theatre is a large open space, supposed to have been soldiers' barracks; and near it is a Doric temple of Hercules, the oldest in the city, and said to have been erected at least 800 years B.C. The great amphitheatre occupies a large space at the E. angle of the town, quite separate, and at some distance from the rest of the excavations. Like other amphitheatres, it is oval-shaped, the extreme outside length being 430 ft., and do. breadth 335 ft. The seats rise above each other in 24 successive rows, and must have accommodated upwards of 10,000 persons.

The baths, which occupy a space, not far from the Forum, of about 100 ft. sq., are interesting not so much from their size as from the simplicity of their construction, which makes their arrangements more intelligible than in the complicated buildings of this kind in Rome and elsewhere. As, however, it would be impossible without a diagram to give a satisfactory account even of those at Pompeii, we pass at once to the domestic architecture of the city, which, indeed, is one of its most interesting features. Mr. Maclaren closely examined about a dozen of the private houses, which, he says, are so different from those either of Britain or modern Italy, that it is not easy to comprehend the use of their several parts. Indeed, most of them are so dilapidated that they could not be understood at all without the aid of Pliny and Vitruvius. "The present condition of the houses and shops resembles what we see in our tenements after the occurrence of a fire. The roof, upper floors, doors, and all the woodwork, have disappeared, the furniture has been carried off, and nothing remains but the half-dilapidated walls, the pavement of mosaic on the ground-floors, columns entire or in fragments, stone counters, and a few bulky or heavy articles of too small value to be worth removing. The apartments, however, have been carefully cleaned out; and not only the houses but the streets were completely free of foreign matter, except a thin covering of ashes and scoræ, deposited by the recent eruption of Vesuvius, and which was easily removed by a besom or whisk of straw." The paintings, also, are still on the walls, and remarkably fresh. The house of Pansa, though not the largest, is better calculated than any other to convey to the reader an idea of a private town residence; and, taking this as a guide, we may remark that the houses generally consisted of a square or oblong enclosure surrounded by blind walls, the central court being open, and chambers formed round it, over which sheds (*compluria*) projected inwards, which discharged the rain water into a stone or marble basin (the *impluvium*), in the centre of the court. The larger houses, however, have a second court, with its corresponding impluvium, surrounded by columns; and hence, while the outer court is called simply *atrium*, the inner one (divided from it by a square apartment, called the *tablinum*, from being usually adorned with pictures and statues) is denominated the peristyle, and was devoted to the use of the family. Bed-rooms and parlours run round both courts, a garden extends some

FOR JACOBUS DE CANGE

PORT LOUIS New Orleans

POST LAMON is one-part of the legend of Minnesota, and one.

PORT PATRICK, a seaport town of Scotland, on Orkney, on a gentle declivity on the E. coast of the strait channel bounded on the land side by hills which uniformly rise, to a remarkably commanding height, to the sight of 600 or 800 ft. W. on S. W. Edinburgh, and S. on S. E. Dunfermline (British Pap. to 1794 608, to 1841 516, of whom about a third are Irish, or of Irish descent).

The principal street is to the tops of a mountain, parallel to the bay and there are 8 smaller streets connected with it, stretching at right angles towards the hills. The houses are, in general well built, comfortable and covered with tiles. With the exception of the parson's house erected in 1833 and of a few others, there are no public buildings, nor any other signs of wealth, though there are fragments of all kinds in the town and the Submarine is at a low state, lower perhaps than in any other place of similar size in Scotland. There is a small parish church, and a small meeting house constructed with the funding system. There are no manufactures, and the only factory is devoted up to some extent

Observations were made in the course of the past year, and in my between Portugal and Madagascar. The absence of the passage from the latter made possible, particularly in the introduction of some cereals, a principal part of which was chiefly for plantations existing from Madag to Brazil, but also for some extent from the former to the latter. But after a short acquaintance by means of commerce had been established between England and Madagascar, Glasgow Liverpool with, &c. the passage by Portugal was all but fully abandoned. Even the trade in cattle had all but ceased. Thus, while about 15,000 tons and cattle were imported into Portugal in 1815, only 1,000 were imported in 1817, and the numbers have since decreased.

Formerly the harbor of Portpatrick was a mere open glen, two ridges of rocks, and was one of the worst and most dangerous on the W. of Scotland. When, in a recent improvement the harbor the wharves, connected to drive her in the length there being so great a space to afford shelter from the ocean. But a group of reflecting lights being want had a great deal ago of it having been discovered to make the place a sheltered station, a new harbor has been constructed, provided by 100 piers, curved to resemble a horseshoe, and crisscross with piers over their extremities by which a entrance is constructed to 140 ft. the area of the harbor the bottom being about 7 fathoms is considerably of this work, even to go between vessels regarded to be required, which was effected by means of portable docks of the dry-dock kind. The original estimate was £110000 of the same degree estimated £100000. After 50 years on the distance to the harbor is very difficult in high weather, and to reach Portpatrick should one go down situated as a perfect station. Latterly instead the town being necessary to shelter it, and the craft on the W. of Scotland has been built which frequently are moored here are now be carried to Glasgow & on a Clyde. Portpatrick has and between a few sailing ships and an iron-clad vessel.

Paragon was long reported to be the Queen's Grand
 Ireland, and was celebrated for its run-away, or
 regular marriage. The town was changed and the
 gable to the parental shopping she performed the
 carriage necessary and it to the union stark. The
 outfit was abandoned to 1000, owing to the time
 taken of the church party. But in the records of these
 events during the preceding period of 10 years, there
 are the names of 10 gentlemen, 10 others of the group
 1899 and 18 children. How they do of Scotland

most of justice, spirit of mission, & interest of original jurisdiction, etc. It is also the residence of the principal foreign consuls in Hanoi and the grand mosque of the city - one of the largest which however is nothing compared to what it was formerly in the early days of the disturbance and destruction that descended upon the colony. (See above.) It is of the origin having been founded in 1740. It is very subject to earthquakes, of one of which it was nearly destroyed in 1770. (Mandarin's House on Hill, 1-60, Rue de la Cour, Comm. Des.)

PORT ROYAL, a town and anchorage, and formerly the commercial cap of Jamaica, is the extremity of a narrow point of land, bounding Kingston Harbour on the S and E about 1 1/2 m. S. E. Kingston is formerly had 2,500 houses, and 600 inhabitants; both have been in great part destroyed by an earthquake in 1832, and having extensively suffered severely by fire and barrages. The public works were transferred to S. E. Jamaica, and it is now insignificant as a town. It is still, however, strongly fortified, and to the east of the royal navy yard, the naval hospital, and of some regimental barracks.

PORTARLINGTON a part two and upward miles of Ireland from Limerick on the Western coast division is one one portion the larger of which is in County and the smaller in Kings co. It is 5 W by W (Sailing). Area of part two the same group of miles in the 1850. It consists principally of a single moor, nearly 1 W in length, extending on both sides the river which is here crossed by 2 stone bridges. This is perhaps the best built and strongest ordinary town in Ireland. Few traces of its size have or might be seen on examination, which arises not from its trade or manufacturing, for of these it has never enjoyed the extent which was once the case, but from the almost total absence of its residential scenery. (See page 100)

FOOTLAND, direct cost of water to the U.S. States

silver, or other mineral products, been hitherto explored. According to an official return the lands under the different species of culture in 1830, and their produce were as follows:—

Articles of Culture.	Acres in Culture.	Produce.
Sugar-cane	14,805	Sugar (maize) 414,600 cwts. Molasses 1,007,799 galls. Rum 12,165 buckets.
Plantains	26,700	Plantains 617,225 loads.
Maize	16,124	Maize 68,750 bushels.
Rice	14,549	Rice
Tobacco	2,589	Tobacco (cured) 24,640 cwts.
Mangoes	1,150	Cassava bread 20,419 loads.
Sweet potatoes	1,294	Sweet potatoes 22,579 cwts.
Yams	6,896	Yams 7,800 —
Pulses	1,100	Pulses 4,479 —
Coffee	16,899	Coffee 220,000 —
Cotton	9,079	Cotton
Fruit-trees and gardens	100	

Account of the Values of the various Articles exported from Porto-Rico in 1845 and 1846, specifying the Values sent to different Countries.

	1845.	1846.
Spain and the adjacent islands	1,393,395 dolls.	719,544 dolls.
Cuba	42,506 —	45,861 —
The Antilles	354,834 —	235,864 —
United States	1,267,073 —	1,841,636 —
Austria	15,427 —	33,166 —
Belgium	28,364 —	10,848 —
Brazil	1,425 —	—
Bremen and Hamburg	252,469 —	298,974 —
Sardinia	147,465 —	132,827 —
Denmark	117,329 —	90,795 —
France	635,279 —	1,043,439 —
Holland	14,934 —	4,499 —
England	946,422 —	884,874 —
Canada and Newfoundland	211,494 —	303,219 —
Venezuela	2,680 —	2,060 —
Totals	5,257,699 —	5,369,019 —

The Quantities of some of the principal Articles exported in 1845, 1847, and 1848, are subjoined.

	1845.	1847.	1848.
Rum	553	537	
Hides	689,973	877,146	
Cattle	4,310	4,476	
Tobacco	2,235,338	2,270,652	
Sugar	27,740,014	101,158,232	25,450,575
Cotton	291,463	362,525	
Coffee	10,475,896	13,466,369	
Molasses	2,444,122	4,427,921	5,703,372

Among the leading articles imported in 1846 were—cotton manufactures, to the value of 783,801 dolls.; woollen do., 67,644 dolls.; drapery goods, 424,567 dolls.; and silk manufactures, 26,419 dolls.

Probably, however, the most advantageous circumstance in the condition of this island is the decided preponderance of the white and free-coloured pop. According to the census of 1836, the inhab. consisted of —

Whites	-	-	-	-	188,809
Free mulattoes	-	-	-	-	101,275
Free blacks	-	-	-	-	26,124
Slaves	-	-	-	-	41,818
Total	-	-	-	-	357,026

This is a better distribution of classes than prevails in any other part of the W. Indies, Cuba not excepted; and the deep-rooted antipathy that exists between the white and black races in the other islands is nearly unknown in Porto Rico. The slaves have always been particularly well treated in the Spanish colonies; and here they are decidedly comfortable, being well clothed, well lodged, and not over-worked.

"The necessaries, and many of the comforts of life are enjoyed by the great majority of the inhabs. of Porto-Rico. The Xivaros, a name applied to all the whites below the better classes, swing themselves to and fro in their hammocks all day long, smoking their cigars, and scraping a guitar. A few coffee plants and plantain trees, a cow and a horse, an acre of land, in corn or sweet potatoes, constitute the property of what would be denominated a comfortable Xivaro; who, mounted on his meagre and hard-worked horse, with his long sword protruding from his basket, dressed in a broad-brimmed straw hat, cotton jacket, clean shirt, and check pantaloons, sallies forth from his cabin to mass, to a cock-fight, or to a dance, thinking himself the most independent and happy being in existence.

"The houses of all classes, in the country, are usually built of wood. The windows have no glass: they are shut with sliding boards; so that when it rains, or when the wind blows with violence, the family remains in darkness. The roofs of the better class of houses are covered with wooden shingles. There are no inns for travellers either in the towns or country." (*Flinter*, pp. 242—251.)

The government, laws, and institutions are nearly similar to those established by Spain in the rest of her Transatlantic colonies. Porto-Rico is governed by a captain-general, whose authority is supreme in military affairs, and who is president of the royal *audencia* for civil matters. The latter court is composed of the captain-general, a regent, three judges, a fiscal, two reporters, and a marshal; and is superior to all other constituted authorities, including the ecclesiastical tribunal. The captain-general has a *junta*, or council of the principal military officers. In the seven towns and villages, which are the caps. of departments, justice is administered by the mayors: in the smaller towns and villages by inferior magistrates, called lieutenants, who determine debts under 100 dollars, act as justices of the peace, collect the duty of subsidy, receiving 6 per cent. on the collections, &c. They are appointed by the captain-general, who also appoints the clergy to their different livings, on the recommendation of the bishop. Public instruction is very backward; but schools, though few, are increasing. The island is divided into seven military depts., each under the command of a Spanish colonel. The regular military force comprises about 10,000, and the militia about 46,000 men. The naval force consists of only a man-of-war, a schooner, and about a dozen gun-boats. The tithes and alcavala duties were abolished in 1815, and the subsidy, or direct contribution on landed property, established instead. In 1832, the total revenue of the island amounted to 798,400 dollars; the direct taxes producing 207,140 dolls., the custom-house duties 493,930 dolls., and the indirect taxes (on cock-pits, billiard-rooms, lotteries, stamps, saleable offices, legacies, bulls, &c.) 97,000 dolls. The duties on imports, which, in 1839, produced 734,761 dolls., consist of certain rates charged on different articles, according to the presumed value. On some articles they are very heavy, and there is, in consequence, a considerable contraband trade. Articles imported in Spanish vessels pay one third less duty, and Spanish produce imported in Spanish bottoms pays a half less. The chief towns of the island are San Juan de Porto-Rico, the cap., Mayaguez, Ponce, Aguadilla, and Faxardo.

Porto-Rico, when discovered by Columbus, in 1493, is supposed, though probably on no very good grounds, to have had 600,000 inhabs., who were, in no very long time, almost exterminated. In the latter part of the 17th century, it was taken by the English; but from the prevalence of dysentery, they were soon after obliged to abandon it; since which, it has been mostly in the quiet possession of Spain. A revolutionary movement, which broke out in 1820, was happily put an end to in 1823. (*Flinter's Present State of Porto-Rico*; and *Official Returns*.)

PORTO RICO (SAN JUAN DE), the principal city, and sea-port of the above island, of which it is the

cap., on rising ground, at the extremity of a peninsula, joined to the land by a narrow isthmus; lat. 18° 29' 10" N., long. 66° 7' 2" W. Pop. 13,000? The town, which lies along the E. side of the harbour, is strongly fortified. The streets cross each other at right angles: being on a declivity it is well drained, and may be considered as one of the best and healthiest towns in the W. Indies. In the earlier part of the present century, most of the houses were of wood; but at present, except in the suburbs, not a wooden house is to be seen, and they are principally two stories high. There are some good public buildings; including the bishop's palace, and seminary; the royal military hospital, with 350 beds; public gaol, house of correction, a handsome theatre, town-house, with a magnificent public hall, several convents, &c. The government house, though old and sombre looking, has some fine apartments. The cathedral is a large, unfinished, heavy fabric; there are several other churches, with a custom-house, arsenal, &c. The harbour has a striking resemblance to that of the Havannah, to which it is but little inferior. Its entrance, about 300 fathoms in width, has the Morro Castle, at the N.W. corner of the city, on its E. side, and is defended on the W., or opposite side, by forts erected on two small islands. Within it expands into a capacious basin, the depth of water varying from 5 to 6 and 7 fathoms. On its W. side, opposite to the city, there are extensive sand-banks; but the entrance to the harbour, and the harbour itself is unobstructed by any bar or shallow. Porto-Rico is the residence of the governor, and the seat of the superior courts, &c., for the island. It has a society for the promotion of the fine arts, with numerous public schools, hospitals, &c. It engrosses the larger portion, by far, of the commerce of the island, and has, in consequence, attained to considerable distinction among the emporiums of the W. Indies. (*Flinter's Porto-Rico*; *Commercial Dict.*, &c.)

PORTSMOUTH, including its suburb of Portsea, a parl. bor., and a celebrated sea-port town of England, being the principal naval arsenal of Great Britain, and the grand station of the fleet, hund. Portadown, co. Hants, on the W. side of Portsea Island, at the entrance to Portsmouth Harbour, opposite Gosport, and on the N. side of the channel, separating the Isle of Wight from the mainland. 16 m. S.E. Southampton, and 65 m. S.W. London; lat. 50° 48' 3" N., long. 6° 5' 59" W. The area of the parl. bor. and the pop. at the under-mentioned decennial periods have been as follow:—

Parishes.	Area in stat. acres.	Pop. in 1801.	Pop. in 1811.	Pop. in 1821.	Pop. in 1831.	Pop. in 1841.
Portsmouth -	110	7,839	7,103	7,269	8,063	9,334

Portsea Island, which has Portsmouth at its S.W. extremity, is about 4 m. in length (N. and S.), and from 2 to 3 m. in breadth, between Portsmouth harbour on the one side, and Langstone Harbour on the other: it is connected with the main land, at its N. extremity, by a stone bridge, and is generally fertile and well cultivated, producing excellent crops of corn, and large quantities of particularly fine garden vegetables. Besides the above towns, Portsea Island has several villages; and its coasts are well defended, at numerous points, by strong military works, including, together with the fortifications of Portsmouth itself, Fort Cumberland, Southsea Castle, a long line of intrenched works at Hilsea, &c. The external appearance of Portsmouth and Portsea is greatly embellished by the fine trees which ornament their ramparts; and few towns exhibit so imposing an approach as Portsea at its principal entrance from London. The entrances to Portsmouth, the older and more southerly part of the parl. bor., are much less striking; but its interior is far superior to that of its neighbour. Portsmouth may be generally described as consisting of three or four parallel streets, crossed at right angles by two or three other lines of thoroughfares. High Street, the principal, with its angular continuation, Broad, or Point Street, runs entirely through the centre of the town; it is wide and handsome, having on either side many large and excellent houses, several public buildings, and some very superior hotels. It has also been much improved by the removal, in 1836, of the old town-hall, an unsightly brick building, which previously stood about its middle, blocking up the greater part of the coach-road. Many good private houses are to be met with in some of the other streets, and on the Grand Parade, a spacious open area, used for garrison inspections, and for the daily muster of the several guards; but in general the private buildings are of an inferior character, and the back streets, particularly those at the Point and toward the

* Portsea Guildable is that part of the par. of Portsea not within the jurisdiction of the bor. of Portsmouth previously to the passing of the Mun. Reform Act.

west of the town, are of the human character, and do to some disgusting duty. The Point is a U peninsula overlooking W, to form the mouth of Baltimore, and mostly beyond the walls of the town. With the opposite part of Portau, the principal and great traffic part of the shop system, between the day their offices have, and, to them of our especially, it exists a scene of the greatest activity arises, which has entirely grown up since the beginning of last century, as a town formerly called Portau. With Commerce it is Portau, and was greatly out on the water to escape and pay. It is divided into entirely equal parts by its main thoroughfare, Queen-st, which runs the street is to a direct line from a Quay and a Road on each side with shops, many of all surround those of the Strand or Fleet Street. Some of the other streets, as St. James's Street, King-st, the Corporation Street, &c. are tolerably broad and I still see some shops under of the ancient approach to the modernity. The houses in Portau are rarely more than two stories in height, and their fronts are tall and elevated. It has but one handsome stone church.

George's Square, and two public buildings; and, third, within the last few years, it had completely ceased denoting the name. Both towns are well served, I supposed with water, and well lighted with gas, but a pollution is said to be very objectionable for distances beyond the walls—comprised at least half past two—that there were densely packed gardens extending over a space fully as large if not larger than that occupied by the two towns. Of these suburbs, however, it has any pretensions to beauty. It consists of a collection of well built houses facing the sea, and the remnants of Portsmouth, being detached principally naval military and government civil officers, and were surrounded within during the summer season, and these houses are a number of handsome streets, which are common, &c.

The importance of Portsmouth, the site of Plymouth, and wholly on the coast-line of our harbor and its immediate vicinity as a place for the outfit and conversion of the force in the channel or of those existing. The camp of 9,000 and 10,000. It is this that has to be selected as the principal station of the army. It is necessarily advanced far to the highest point, as a good drink.

The harbor which is connected to Great Britain, is supposed not to be the best, but a narrow strait, not exceeding 20 yards in width, between the islands of Oahu and Kauai, but within 10 miles of the mouth of the harbor is a wide bay capable of accommodating a greater part of the navy of Great Britain. There is no strait in the entrance to the harbor; but as it has not 15 feet water over it, even at the lowest spring tide, it can hardly be said to be any obstruction to the passage, and when the harbor there is some miles to the largest man of war at any time of the tide. The anchorage ground is excellent and being a fine smooth water, or other obstructions, ships lie securely in it as if they were in dock.

The dock yard, which comprises about 180 acres, lies on the E. side of the harbor. It comprises all the equipment necessary for the construction and re-

all events, vastly improved by the Immigrant Service, the existing situation. It is increasingly homogeneous, and has been productive of a vast saving of money. During the last two upwards of 4,000 working men were employed in Portsmouth dock yard of whom 1,000 were shipwrights and another 100 in class of painter the quarters are greatly reduced.

In the Back Yard are the Navy Pay-office, the cadet mess of the post-admitted, the cadet's dispensary, and the bands of the principal departments of the establishment. The post-admitted's residence, formerly that of the colonel-in-chief, whose duties are now performed by the major-in-chief, is an elegant office of white brick surrounded by gardens. Near it is the Royal Naval College, a spacious dark-tiled edifice, erected in 1793, its ceiling ornamented by a cupola and surrounded by a well furnished with instruments. Here pupils intended for the navy were formerly instructed in navigation, &c., but in 1846, the college was remodelled, and is now appropriated to the instruction of junior naval and marine officers in the higher branches of science connected with their profession, and especially the principles and practice of naval gunnery. The officers belonging to this establishment are housed and lodged in the college, but are bound on the fringe as part of the complement of a ship of the line to the harbour, immediately being the residence of the post-admitted, to a handsome white brick building, intended originally for a group of cadets of naval cadets, for the education of a superior class of shipwrights. A plan which though as to very satisfactory grounds, has often been abandoned. In the park to front of the old wooden building, is a pleasant luncheon station of William III. Adjacent to the college is a small chapel-of-ease for private services to the dead part. The latter was, during last century the scene of several marriages. One of these in 1776, was chiefly the work of an auxiliary who was captured and executed for the offence. The dead part is, however, daily open to the inspection of visitors who apply for admission at the gate.

To the S. of the duck pond, and across the mouth of the harbor is the Grosvenor, or ground for athletic sports. This is an extensive and very complete establishment. As a sports ground it is inferior to the grounds at Worcester, but in most other respects it is very superior to the latter. It comprises many extensive and handsome structures, fitted with all kinds of apparatus, a new one-way road with cages and containing small cages for 20,000 men, a laboratory and various other offices, a sports cage along the harbor, and a series of excellent residences for the officers, flanked by a double planted terrace. This establishment is separated into the two divisions of the old and new (the wing by the dock pond) a distance of about ten acres (Parliament) and Palace, which occupies the whole of land and also forms a considerable part of the former grounds. The Veterinary Department, which formerly occupied some large part of building within the walls of Parliament, was in 1881, removed to Wood Lane (Grosvenor) and its former structures have partly been purchased by the officers of the town and partly given place to a handsome row of modern dwellings, the new stables and the building of the Philosophical Society. The Union House is an independent building, but in a convenient situation. The functions of government are conducted by a first class, who occupies a small mansion in High Street, formerly the residence of the most illustrious.

Portsmouth appears to have been originally built by Edward IV. Its walls were greatly enlarged and improved during the reigns subsequently succeeding, and in those of Elizabeth I. James I. and James II. (reign William III. they were completely nearly as at present, the tower being almost wholly enclosed within a battlemented rampart the ramparts lined with masonry and encircled with broad moats, with a glacis beyond. This, owing to the old

nothing by itself," the flying and dust-borne, also birds are also carrying dust, which is all on the most extensive scale. Probably because of dust becoming necessary to dust, instead, as,

a structure of the last century, covers a very large space, and has earthen ramparts faced with brick, and barrack-room for 3,000 men. The town, its suburbs, and auxiliary fortresses are garrisoned by the Portsmouth divisions of royal marines, and marine artillery, and a certain number of infantry of the line. Within the town are several capacious and excellent barracks; and there are others in the gun-wharf, at Tipner, Hilsea, &c. Portsmouth has a military hospital, and a Marine Infirmary situated between the custom-house and the gun-wharf. But Haslar hospital for the reception of sick and wounded seamen, the principal establishment of its kind in the kingdom, is on the opposite side of the harbour at Gosport (which see). The chief engineering department for the S. and W. of England, and the residences of the commandants of the marines and engineers, are among the other principal government buildings.

The par. church of Portsmouth, founded about 1220, but principally rebuilt in 1693, is a spacious stone edifice with a square tower, 120 ft. in height, surmounted by a cupola and vane, which forms an important landmark. Among other monuments, it has one to Villiers, duke of Buckingham, assassinated here in 1628. The vicarage, value 555*l.* a year, is in the patronage of Winchester College. Adjoining the grand parade is the garrison chapel and burying-ground. In Portsea are two chapels of ease, St. John's and St. George's. St. Paul's, Southsea, and All Saints', Newtown, are elegant Gothic edifices of similar architecture, the former built, in 1822, at an expense of 15,229*l.*, and the latter, in 1827, at a cost of 12,464*l.* Two new churches are in progress of erection, one at Landport, and the other in the town of Portsea. Portsea par. church is an antiquated edifice at Kingston, about 1½ m. from the town, and surrounded by a very extensive cemetery. The living is a vicarage, in the patronage of St. Mary's College, Winchester, value 696*l.* a year. There are numerous places of worship for Independents, Baptists, Wesleyans, Bryanites, &c.; the Scotch Presbyterians, Unitarians, Rom. Caths., and General Baptists have each a chapel, and the Jews a synagogue. The town-hall and jail together occupy a large edifice; the latter, which is clean, convenient, and well-conducted, is under the jurisdiction of the bor. magistrates. A new market-house and exchange, the general dispensary, savings' bank, workhouses, female penitentiary, beneficial society's hall, literary and philosophical institution, with a handsome edifice, and a good museum and library; Hampshire library with 5,000 vols., the King's Rooms at Southsea, with an excellent bathing establishment, Green Row and York Rooms, used for balls, &c., and a theatre, are the other principal buildings of public interest. There are Lancastrian and national schools, an endowed free-grammar school for 50 boys, and St. Paul's school, a joint-stock subscription academy for superior classical and mathematical instruction; besides several good private academies, a mechanic's institute, forensic, philharmonic, &c., societies, and various charities. On the London road, about 1½ m. from the town, is a new and spacious public cemetery, with an elegant entrance, a chapel, officiating minister, &c.

In addition to its other conveniences, Portsmouth harbour enjoys the important advantage of opening into the celebrated road of Spithead, between the Hampshire coast and the Isle of Wight. It derives its name from a sand-bank called the Spit, extending about 3 m. in a S.E. direction, from the narrow neck or tongue of land on which Gosport is built. A ship of war was formerly kept moored, as a guard or receiving ship, at the head of this bank; but since the peace this practice has been discontinued, and the roadstead is merely marked by buoys placed at regular intervals. It is here that ships fitted out in the docks and harbour rendezvous before going to sea; and it is also a secure and convenient asylum for the channel fleet and other vessels, during the occurrence of storms. From its safety and capaciousness this roadstead is called by sailors, "*the king's bed-chamber*." "Thus," to use the words of Dr. Campbell, "it appears that Portsmouth derives from nature all the prerogatives the most fertile wits and most intelligent judges could devise or desire; and that these have been well seconded by art, without consideration of expense, which, in national improvements, is little to be regarded. Add to all these the striking excellence of its situation, which is such as if Providence had expressly determined it for that use to which we see it applied, the bridling the power of France, and, if I may so speak, the peouliar residence of Neptune." (*Survey of Great Britain*, i. 370.)

Inasmuch as Portsmouth depends for support on its being a great naval port and arsenal, its prosperity is necessarily greatest during war. At present, however, if we compare it with previous periods of peace, it may be said to be flourishing. It necessarily has a considerable trade in the importation of the various articles required in its numerous establishments, and for the supply of

the inhabs., and the victualling of the fleet. In Jan. 1850 there belonged to the port 244 vessels, of the aggregate burden of 14,874 tons, ex. 4 steamers. Gross customs' duty in 1849, 47,868*l.* Excepting some extensive breweries, no manufacture, unless it be that of ships of war, is carried on within the town. About 3 m. N.E. were some extensive salt-works, so very ancient as to be referred to in Doomsday-book; but they have been abandoned within these few years.

Portsmouth is connected with Arundel and London by a navigable canal, and communicates with Gosport by a floating bridge for passengers, carriages, &c., the property of a company incorporated in 1838. It is, also, directly connected by a branch line with the S.W. Railway, which brings it within about 2 hours' travelling of the metropolis; and it is, also, connected by railway with Chichester, Brighton, &c. Steam-packets ply during the year to Ryde, Cowes, Lymington, Havre, Plymouth, Dublin, London, New York, &c. A branch of the Bank of England, and 5 private banks, are established here; and it has a weekly newspaper.

Portsmouth received its first charter from Richard I., which was confirmed by various subsequent monarchs. Under the Municipal Reform Act it is divided into 7 wards; its municipal officers being a mayor, 13 aldermen, and 42 councillors. Corporation revenue in 1848-49, 8,522*l.* It has a commission of the peace under a recorder; and the boundaries of the municipal and parl. bor. are co-extensive. Petty sessions are held 3 times a week, and a county court is established here, before which 2,181 plaints were entered in 1848. Portsmouth has sent 2 mems. to the H. of C. since the 23d Edw. I.; the right of election down to the Reform Act being vested in the mayor and corporation, the number of which seldom exceeded 60. The electoral limits were enlarged by the Boundary Act, so as to include all the parish of Portsea with the old borough; and, in 1849-50, there were 2,269 registered electors. Portsmouth is one of the polling places at elections for the S. division of Hampshire. Markets on Tuesdays, Thursdays, and Saturdays. The charter of Richard I. established a fair in the town, called the "Free Mart;" which lasts for 15 days from July 10, and is succeeded by a 3 days' fair on Portdown Hill, attended by a great concourse of people.

The earliest mention of Portsmouth occurs in the Saxon chronicle, which states that it existed in 501. It probably owes its origin to the sea having retired from Porchester, probably the anc. *Portus Adurni* at the upper end of the harbour; on which account the inhabs. removed thither, and built a town at the mouth of the Port. It was taken and burnt by the French, in 1377, but was soon recovered; and in the reign of Henry VIII. had become the principal naval arsenal of England. (*Boundary, Municipal, &c. Reports; Charpentier's New Portsmouth Guide; Private Information.*)

PORTSMOUTH, a town and port of entry in the U. States, being the largest town, though not the cap., of New Hampshire, on a peninsula in the Piscataqua, 3 m. from the Atlantic, 40 m. E.S.E. Concord, and 50 m. N.N.E. Boston; lat. 43° 4' 30", long. 70° 45' W. Pop., in 1840, 7,884, being one of the few towns in the U. States the pop. of which has decreased (196 individuals) since 1830. It is well built; and having suffered severely at different times from fire, is now mostly constructed of brick. It has many handsome houses, and there are several good public buildings, including a fine episcopal church, various other churches, a court-house, gaol, almshouse, academy, atheneum, &c. Its harbour is one of the best in America; it is completely landlocked, and is accessible to vessels of the largest size, having 40 ft. water in the channel at low tide. It is defended by several forts; and on Great Island at the W. entrance is a light-house, with a fixed light 90 ft. above the sea. Two wooden bridges cross the Piscataqua at Portsmouth, one of which is one-third of a m. in length. On Navy Island, opposite the town, is a navy-yard, belonging to the U. States, with three wet-docks, and other establishments fit for the construction of large ships of war. Portsmouth has a considerable but not an increasing trade, it being the only sea-port of New Hampshire. In 1849, the aggregate burden of vessels owned in the port and district amounted to 26,369 tons. (*U. States' Trade Report; Encycl. Americana, &c.*)

PORTUGAL (KINGDOM OF), anc. *Lusitania*, the most W. state of Europe, occupying the greater part of the W. portion of the Spanish peninsula, between the 37th and 49d degs. N. lat., and the 6th and 10th W. long., having E. and N. Spain, and S. and W. the Atlantic. Length, N. to S., about 350 m.; average breadth, rather more than 100 m. Area, pop., subdivisions, &c. as follow:—[See top of next column.]

Geographically considered, Portugal can be regarded in no other light than as a dependency on, or portion of Spain; and, in fact, all the mountain chains and great rivers by which she is traversed originate in the eastern

under other circumstances, might have been anticipated. We have elsewhere seen (art. Oporto) that, at an average of the three years ending with 1840, the shipments of port wine from Portugal amounted to 84,790 pipes a year. It is a curious fact, that the Oporto wine company, after being suppressed by Don Pedro, as a nuisance, has been re-established, though with less oppressive privileges. (*Henderson on Wines*, 198—214.) In addition to port, considerable quantities of Lisbon, Calcavella, and other white wines, are exported. Some red wine is also exported from Figueiras.

The pastures in Minho, and in the Sierra Estrella and some other parts, are excellent. But throughout most part of the kingdom they are very much neglected. In consequence of the great number of fast days enjoined by the church, few cattle were reared; and a large proportion of those required for the consumption of the principal towns were imported from Galicia and other adjacent Spanish provs. Horses are scarce; oxen being commonly used for draught, except in towns. Mules, however, are numerous, and of an excellent breed; and, with asses, are generally preferred, on account of the rugged nature of the country, to horses for travelling. Sheep breeding is principally conducted in Beira, whence large flocks are sent to winter in Alemtejo. The wool of the Portuguese sheep might, no doubt, with a little attention, be rendered equal to that of the Spanish sheep; but no pains have been taken to improve its quality. Goats and hogs are numerous; and the latter are of a superior kind, and yield excellent hams. The fisheries, which were formerly important, are now insignificant: except in Algarve, where tunny, pilchards, &c., are taken, Galicia and England supply the greater part of the fish made use of.

The mineral products are considerable, though few mines except those of iron have been wrought, in consequence partly of the scarcity of fuel, and partly of the supply of minerals (chiefly copper and lead) from Brazil. The mountains abound in fine marble, and contain traces of gold and silver. Large quantities of salt of a very superior quality are produced in bays along the coast by natural evaporation, especially at Setubal or St. Ubes, whence it is largely exported.

Gold dust is obtained by washings; and in antiquity the Tagus was famous for its golden sands: *Tagus auriferis arenis celebratur*. (*Plin. Hist. Nat.*, lib. iv. cap. 22.) Coal is found near Oporto and elsewhere; and lead, antimony, &c., are raised, but not to any considerable amount.

Manufactures and Trades.—An Englishman can with difficulty form an idea of the backward state of manufactures in Portugal: they are in general carried on in separate cottages, like the coarse woollens of North Wales, or the linen of Normandy, and are founded on the primitive plan of every family manufacturing for its own consumption. Manufacturing establishments are but few in number, and are principally for the production of woollens, silk, and earthenware. Cotton has, also, been attempted of late years; and paper, glass, and gunpowder are made in a few places.

One might be disposed to think from the pompous enumeration of factories made by Balbi, and his vindication of the Portuguese from what he is pleased to call the *reproche banal* of their being without manufactures, that, on the contrary, manufacturing industry was in a very flourishing state amongst them. He even goes so far as to say that the cotton yarn produced at Thomar is at least equal to that of England! It was hardly necessary, perhaps, to notice such ridiculous statements. The cottons, woollens, linens, hardware, and earthenware of England, are all largely imported into Portugal, and are used by all but the very lowest classes. To suppose, indeed, that there should be any thing like really successful manufacturing establishments in a country like Portugal, is to suppose what is all but contradictory and absurd.

"A very superficial knowledge even of some of the commonest arts exists. A carpenter is here the most awkward and clumsy artisan; and the way in which the doors and wood-work belonging to the good houses are finished would have suited the rudest ages. Their carriages of all kinds, more particularly their waggons and carts, their agricultural implements and management, their cutlery, locks, and keys, are ludicrously bad. The chief *forte* of the Portuguese appears to lie in ship-building and stone-masonry; they also excel in embroidery, and make good artificial flowers, and lace." (*Baillie's Lisbon*, i. 17. &c.)

The navigation and commercial intercourse of Portugal are of more importance; and though even in the times of Emanuel and Albuquerque, they were by no means so extensive as is generally supposed, they were, notwithstanding, very considerable, and appeared immense from the small amount of the shipping and trade of other nations. For a long time past, the import and export trade of the country has been conducted chiefly by foreign merchants, particularly British, settled in Lisbon and Oporto. The exports consist almost en-

tirely of raw produce, or of wine, oil, salt, wool, fruits, cork, &c. The imports have hitherto included corn and flour, but, as already seen, these will now probably be dispensed with; the other articles are cotton goods (by far the most important article), hardware, woollens, fish, linens, earthenware, drugs, tea, coal, &c.

Nearly all the foreign trade centres in Lisbon and Oporto, which see. It is principally carried on with England and Brazil. At an average of the six years, ending with 1838, the real value of the British produce and manufactures exported to Portugal amounted to 1,242,114*l.* a year; but of this a considerable portion was subsequently re-exported for, or rather smuggled into Spain. Perhaps, at an average, the value of the imports and exports of Portugal may each amount to about 2 millions a year. Formerly, Lisbon had about 400 large ships employed in the trade with S. America, but now she has not more than 50 or 60 ships in all departments of her foreign trade, and those, too, of comparatively small burden. We subjoin an

Account of the Quantities of the Principal Articles of Foreign and Colonial Merchandise Imported into the United Kingdom from Portugal in 1848.

The internal traffic of such a country is, as may be supposed, inconsiderable. There is no navigable canal; and till of late years, not a single road in Portugal was practicable for carriages for more than 20 or 30 m. from Lisbon. In fact, the only mode of travelling by land from Lisbon to Oporto is in a litter, or on the back of a mule or horse; and in the wine country of the Douro, or in the province of Minho, two oxen sometimes take a whole day to convey a pipe of wine 5 or 6 m.; and to prevent the cart from being overturned, it is attended by 2 men. Accounts are kept in reis and milreis; the milrea contains 1,000 reis, and is worth about 4*s.* 6*d.* The *dobroa*, or doubloon, = 3*l.* 6*s.* 6*d.*; the *crusado* = about 2*s.* 6*d.* The lb. is 4,589 kilogr., or rather more than the lb. avoird.; the arroba = 32 lbs.; the quintal = 4 arrobas. The mayo for grain, &c., = 24 bushels; the almudo = 4½ gallons. The Portuguese foot is a little longer than the English.

Constitution.—Like the peninsular kingdoms of Castile and Arragon, Portugal had anciently her Cortes or assemblies of the states. One of these assemblies, held at Lamego in 1141, conferred the title of king on Alfonso Henriquez, who had two years previously defeated the Moors in the great battle of Ourique. The Cortes at the same time enacted a law for regulating the succession to the throne; in which, among other things, it is laid down that females shall not be eligible to the crown, though in the direct order of succession, if they have married a foreigner, and that their marrying a foreigner when on the throne shall be considered equivalent to an act of abdication. The powers of the Cortes corresponded, in other respects, with those of similar assemblies in other countries; but their privileges and those of the sovereign were very ill defined; and the latter contrived, in the course of time, to engross all the powers of the state; the government of Portugal became, in all respects, as despotic as that of Spain; and the last convocation of the Cortes took place in 1697. (See *L'Art de vérifier les Dates*, part II. tom. vii. 1—40., 8vo. ed.)

From this period down to the administration of the Marquis de Pombal (1750-1776), every abuse continued to multiply, and Portugal was distinguished only by the imbecility of her government, the power and profligacy of the nobility and clergy, and the poverty and indolence of her people. The Marquis de Pombal suppressed the order of the Jesuits and confiscated their estates; he also suppressed some of the more oppressive privileges of the nobility and clergy; and effected various important reforms in several departments of the administration. In other respects, however, his policy evinced the narrowest and most illiberal views; and on his dismissal from power, most part of the old abuses in the government revived, and the country continued in its former state of apathy and abasement.

The events connected with the late war in the peninsula, the emigration of the court to Brazil, the long continuance of the English armies in the country, the organization of the Portuguese army on an improved footing, and the influence of the changes in Spain, laid the foundations of a new order of things. The nation was dissatisfied with the continued residence of the court in Brazil, which, in fact, made Portugal a dependency of the latter, and the wish for some fundamental changes in the frame of the government became general.

ginian colonies are supposed to have been planted on its shores. It remained a Roman province till the 5th century, when it was invaded by the Suevi, Visigoths, &c.

The Moors landing in the S. of Spain in the early part of the 8th century, and meeting with little resistance from its thinly spread population, easily overran the greater part of Portugal; but the nature of the country favouring the operations of the inhabitants, they were not long in recovering possession of its more northern and mountainous portion. The name of Lusitania seems to have been exchanged about this period for that of *Portugale*, subsequently changed into Portugal, from the circumstance of Oporto, the principal strong-hold of the Christians, being then called *Caile*, or *Porto Caile*. (D'Anville, *Etat présent de l'Europe*, p. 193.)

In the 11th century Portugal became an earldom, under the kingdom of Leon and Castile; and during the 12th it was erected into an independent kingdom. Its power now rapidly increased; and by the acquisition of Algarve, in 1249, it arrived at its present limits. In the latter half of the 14th century the voyages and discoveries commenced which have shed immortal lustre on the Portuguese name. During the 15th century, Madeira, the Canaries, and Azores were discovered, and

logical seminary for the education of Catholics, a school of arts, &c. The business of watch-making is carried on to some extent; and there are manufactures of leather, linen, fire-arms, &c. It has three great annual fairs. Here, as in the rest of Poland, the buying and selling of goods is chiefly managed by Jews, who occupy a particular quarter of the town.

POTENZA, (an. *Potencia*), a city of the Neapolitan dom., prov. Basilicata, of which it is the cap., on a hill in a wild and rocky tract, near the source of the Basento, 64 m. E. Salerno. Pop., *circa* 9,000. It is fortified, and has a cathedral, several other churches, and convents, a seminary, a royal college, lycæum, hospital, government pawn-bank, &c.; but, speaking generally, it is poor and meanly built. It is a bishop's see, and the seat of the superior judicial courts for the prov. It suffered greatly from earthquakes, especially in 1684, and 1812. (*Banpoldi, Corografia; Diet. Géog.*)

POTOSI (SAN LUIS DE), a city of Mexico, cap. of the state of same name, near the source of the river Tampico, 165 m. W. Tampico, and 75 m. N.N.E. Guanajuato; lat. 23° N., long. 108° 1' W. Pop. of the city itself about 15,000 (*Poinsett*), but including the *arrabios*, or suburbs, which cover a large extent of ground, it may amount to from 50,000 to 60,000 (*Ward*). "It presents a fine appearance: the churches are lofty, and some of them very handsome. The streets are well built, very clean, and intersect each other at right angles. The houses in the square, and in the principal avenues leading to it, are of stone, and two stories high; those in the suburbs are low, and of adobe (sun dried bricks). The government house, in the square, is not yet completed; but the front, which is of cut stone, and ornamented with Ionic pilasters, would do credit to any city in Europe. The market-place is well supplied with meat, fruits, and vegetables. Pedlars hawk up and down the coarse manufactures of the country. Stalls are erected and set out with mantles, blankets, leather breeches and leggings, saddles, bridles, huge wooden stirrups, iron spurs, weighing at least 2 lbs., and a great variety of manufactures from the filaments of the Agave: ropes, cord, twine, and thread, matting, bags, saddle-cloths, &c. &c. Here, as in every part of Mexico, the vendors were satisfied with one-half of their asking price, and frequently with one-third part of what they, the instant before, had sworn on their consciences the article was worth." (*Poinsett's Notes on Mexico*, pp. 342—346.)

From its situation, this city is the natural *dépot* of the trade of Tampico with the N. and W. Mexican states. Its foreign trade is at present almost wholly in the hands of natives of Old Spain or of the U. States. The European imports consist principally of French brandies, wines, silks, and cloths, English hardware and printed cotton goods, with some mantles or ordinary cotton manufactures from the U. States. In addition to its foreign trade, San Luis supplies the neighbouring states of Leon and Coahuila with home-made goods of various kinds. The town abounds in tailors, hatters, leather dressers, and smiths; and the whole pop. seems industrious (*Ward's Mexico*, ii. 237.) The people are better dressed, and there are fewer beggars here, than in almost any other part of Mexico. The mines in the neighbourhood have long ceased to be wrought, from exhaustion of the ores; they were, however, formerly very productive. A college, founded by voluntary subscription, and in a flourishing state, affords gratuitous instruction to poor students in Latin, jurisprudence, theology, and constitutional rights. The city was founded in 1586. (*Poinsett's Notes on Mexico*, p. 342—346; *Ward's Mexico*, ii. 236—239.)

Potosi, a city of Upper Peru or Bolivia, famous for its rich silver mines, on the N. declivity of the Cerro di Potosi, a mountain belonging to the Andes, lat. 19° 36' S., long. 67° 31' 45' W., 64 m. S.W. Chuquisaca. Early in the 17th century this city is said to have had 160,000 inhab.; but it is now almost deserted. It is built on uneven ground, and has a spacious square in the centre. The government-house, the town-house, and the jail, under the same roof, occupy one side; the treasury and government offices another; a convent, and an unfinished church the third; and private houses the fourth. Extensive suburbs, once tenanted by Indians and miners, are now without an inhab., and the vestiges of the streets are all that remain. Among the most remarkable public edifices is the mint, substantially built of stone, in 1751, at a cost of 1,148,000 dols. In the principal square an obelisk 68 ft. high was erected in honour of Bolivar, in 1825. The houses of Potosi, generally, are of stone or brick, and of only one story, with wooden balconies, but without chimneys. The country round is perfectly barren, and the climate disagreeable; the rays of the sun are scorching at noon, while at night the air is piercingly cold. The market is well supplied; though, from many articles having to be brought from a considerable distance, the necessaries, as well as the luxuries of life, are very dear.

The Cerro di Potosi, which is 19 m. in circuit, and

in this prov., especially in the circle of Bomater: above 1,200,000, worth, on the spot, above 65,000 rix-dollars, were exported in 1840; and, in 1839, the exports were still more extensive. This is the most backward of the Prussian provinces. When it first came into the possession of Prussia, in 1792, the great bulk of its inhab. were in a state of predial slavery, and were as ignorant and brutalised as can well be imagined. The vigorous and enlightened government of Prussia at once put down the excesses of the nobles, and has exerted itself by introducing an improved judicial system, establishing schools and otherwise, to improve the habits and condition of the people. These efforts, combined with the total abolition of servitude (*see* PRUSSIA), have had the best effects; though a lengthened period will still have to elapse before the vices and habits engendered by centuries of slavery and degradation be completely eradicated, and the population become as intelligent and industrious as in the more advanced provinces.

Posen, a city of Prussia, cap. prov. and reg. of the same name, at the confluence of the Proana with the Warta, 147 m. E. by S. Berlin; lat. 53° 29' N., long. 16° 53' E. Pop., in 1846, 40,309. Since the peace of 1815 its fortifications have been vastly improved, and it is now one of the bulwarks of the kingdom on the side of Russia. Though an old town, it is pretty well built. Principal edifices, cathedral and town-house. It is the residence of the provincial authorities, and of an archbishop; and has a court of appeal, a gymnasium, or college, a theo-

to the height of 15,087 ft., is supposed to be a solid either of the ore or the matrix of the precious metal, of which it has produced a vast quantity. From the city, it appears dyed all over with rous tints, green, orange, yellow, grey, and rose r. The discovery of its wealth was made by an n, who, in hunting some goats, slipped, and, to save if, took hold of a shrub, which, in coming away the ground, laid bare the silver at its root. The were first wrought systematically, in 1545, from time till 1808, they are said to have produced 300,000 piastres, or 237,388,334l., worth of silver on duty was paid; and during the same period they produced a large quantity of gold, at the same time great quantities of both metals were smuggled, or into circulation without payment of the duty. 5,000 openings are said to have been made in the stain; but the number of mines wrought during the nt century has rarely exceeded 100. At one time, mines yielded about 30,000 ducats a day; and for a hened period they produced about 9,000,000 dollars r. But they had begun to decline long previously to revolution; and since then they have been, whether their exhaustion, defects in the mode of working, e want of capital, nearly unproductive. The ore is rised in water-mills, worked with overshot wheels, om 1 to 10 m. from the city; but, according to n, both the mining and reduction of the ore were acted in the most bungling manner. (*Andriew;* r; *Mod. Trav.*, xviii.; *Geog. Journal*, v.; *Encyclopædia*, &c.)

POTSDAM, a town of the Prussian states, prov. denburg, cap. reg., at the confluence of the Havel the Havel, on an island formed by the two rivers, a l and lakes, 17 m. S.W. Berlin. Pop., in 1846, 37,523 dam has been appropriately termed the Versailles of sla. It is a favourite royal residence; streets straight, d, and well paved; and the houses, though fre- dly small, and not very commodious within, have, he most part, splendid fronts. It is encompassed by and palisades; has numerous gates and bridges, e of which are highly ornamental, and is divided three parts, the old and new towns, and Frederick- t. The most remarkable edifices are, the palace, a nificent structure on the Havel, having attached to theatre, menagerie, and spacious stables; the church he garrison, in which are deposited the remains of ick the Great; the church of St. Nicholas; the t military orphan hospital, &c. In the old market- e is an obelisk of red Silesian marble, 75 feet high, pedestal of white Italian marble; on the base are ibered the names of the great elector and his suc- ors. A large garrison is always kept at Potsdam, hat the barracks are very extensive. There is a um, a military school, with various public schools nferior note, and sundry literary establishments. ve are also, exclusive of the military orphan hos- l, mentioned above, an infirmary, workhouse, &c. dam was formerly said to be more of a barrack than town; but for a good many years past it has been nglished in various branches of manufacture, such hat of silk, hardware articles, arms, &c. Being si- ed on a navigable river, communicating by canals, with many large towns, and with the Elbe and the r, it has a good deal of commerce.

otadam is a very old town, having existed in the 8th tury: it did not, however, become a place of any im- uance till the elector Frederick William selected it a residence, and began the palace. It was materially oved by the king, Frederick William I.; but, like lin, it owes its principal embellishments to the taste iberality of Frederick the Great. In its environs iew *Souci*, the favourite residence of that illustri- prince, and the place where he expired, on the 17th ugust, 1785. The new palace and the marble palace also in its vicinity.

POUGHKEEPSIE, a town and river-port of the U. tes, Dutchess, co. New York, on the Hudson, 70 m. New York. Pop., in 1840, 10,006, but it now (1850) bably exceeds 12,000. The river-bank here is 300 ft. in ght, but the town has five convenient landing places. occupies a flat of about 1,500 acres; on which some streets have been laid out; several of which are well ed. Many of the stores (shops), in the main street, equal to those of the Broadway in New York; and narrow private houses exhibit both wealth and taste. When 1831 and 1836, upwards of 100,000 dollars were eeded in the improvement and enlargement of the n; and 25,000 dollars in the construction of reser- rs, &c. In the latter year, there were 10 churches, a rt house, a jail, a co. workhouse, an academy, a Lan- trian school, four banks, and several whaling and er companies. Poughkeepsie has a considerable de; and communicates regularly, by steam boats, n New York, Newbury, &c. It was founded by some ch families, in 1788, and incorporated in 1801. (*New rk Gazetteer*,)

of the Green Chamber, by the deputies of the kingdom, in 1618. Notwithstanding the great height of the windows whence they were ejected, the commissioners escaped unhurt, by falling, as is said, on a dunghill. This event may be regarded as the commencement of the 30 years' contest, ended by the peace of Westphalia in 1648, which, while it secured the liberties of the rest of Germany, unfortunately consummated the slavery of Bohemia, which had long been foremost in freedom and toleration. The cathedral, begun in 1344 and finished in 1486, is within the precincts of the Hradschin. It is a fine specimen of Gothic architecture, and is surmounted by a lantern-crown similar to that on the tower of St. Giles, Edinburgh. The choir, built by Charles IV., and the unfinished chapels that surround it, are much admired. In the cathedral are the tombs of many Bohemian sovereigns and other distinguished individuals; a fine altar piece and other paintings; mosaics, and the costly shrine of St. John Nepomuck, &c. Others of the numerous churches, as that of the *Theinkirche*, in which is the tomb of the famous astronomer, Tycho Brahé, who died here on the 13th October, 1601, are interesting for their monuments. Prague had formerly a great number of convents; but Joseph II. secularised most of these establishments. Among the chapels is one which is an exact representation of that of Loretto.

The town-hall, arsenal, military hospital, military orphan asylum, lying-in hospital, principal workhouse, and theatre are among the finest of the numerous public edifices. Of the private palaces, that built by the famous Wallenstein, duke of Freidland, is the most remarkable. Though unfinished, it is of immense extent, 100 houses having been pulled down to make room for its site. It still belongs to a collateral branch of Wallenstein's family: the apartments and furniture, which are said to remain in their original state, are shown to strangers, and the park attached to the palace is thrown open to the public; but the residences of the nobility in the *Kleinseite* are mostly deserted. "They are generally large ugly buildings, some, however, with a good deal of architectural decoration; and the dirty rubbishy appearance of their brick walls, half covered with worn-out stucco, conveys the idea of prisons or poorhouses rather than of mansions of distinguished nobles. Their proprietors have transferred themselves and their wealth to the Austrian capital; leaving to the Bohemians these sad memorials of times, when the court of Prague might have looked with scorn on the inferior splendour of Vienna. Yet, in some of these desolate abodes, covered with dust and rubbish, we found immense collections of books. The Lobkowitz library is said to comprise more than 70,000 vols., the Kinsky 40,000, the Klebelsberg 18,000, the Klam Martinitz 21,000, and others equal or superior numbers. In some of these palaces a few rooms are fitted up and occupied during winter by a minor branch of the family, and in many of them are offices for the stewards and managers of the Bohemian estates; but when, on particular occasions, as, for instance, at the coronation of a sovereign, it is requisite for the proprietors to visit Prague, they usually occupy apartments in some hotel, their own palace being quite unfit for their reception: there are, however, a few exceptions to this general emigration. Here and there may be found the mansion of some great noble, who still upholds the local dignity of his ancestors; and below these highest magnates are a considerable body of resident nobles, inferior in wealth, though perhaps not in blood, who take a part in the provincial administration, and who form among themselves in the winter season an agreeable and elegant society." (*Turnbull's Austria*, &c., i. 101.) In the palace of Count Nostitz is a gallery rich in cabinet pictures of the Dutch and Flemish masters; and in that of Count Sternberg is the national museum, comprising extensive collections of paintings, books, fossils, and natural objects. The library, in the Strahow monastery, one of the finest apartments of its kind in Germany, comprises a collection of about 50,000 vols.

The university of Prague, founded by Charles IV. in 1348, occupies a large edifice termed the *Carolinum*, and is remarkable as the first great public school established in Germany. The students were formerly divided into 4 nations, and are said, though there can hardly be a doubt that the statement is grossly exaggerated, to have amounted, early in the 15th century, to 40,000! In consequence, however, of a measure proposed, in 1409, by Huss, who was then rector, to abridge the privileges of the foreign students, more than half the pupils attending the university withdrew to Leipsic, Heidelberg, Cracow, and other seminaries. The *Carolinum* is now exclusively devoted to instruction in medicine, law, and the sciences; while education in theology is conducted in the *Clementinum*, an immense building, founded by Ferdinand III., in 1682, as a convent and seminary for Jesuits. The university library, in the latter, comprises about 150,000 vols.; it has also an observatory, botanic garden, and various museums; and was attended, in 1840, by about

1,700 students; but it must be borne in mind that the censorship of the press, the prohibition of foreign works, and the jealousy of the government, oppose the most formidable obstacles to the diffusion of knowledge, and hinder any real progress being made in political or even philosophical science. The same causes render the newspapers and other journals published here of little interest or importance. There are 8 gymnasia, preparatory to the university, with several other high schools, ecclesiastical, teachers', and Jewish schools; a polytechnic institute, conservatory of music, academy of the fine arts; and many orphan and deaf and dumb asylums, and other charities. The Jews settled here at a very early period, and have an infirmary and orphan-asylum of their own, and as many as 9 synagogues, one of which is very ancient.

Prague has manufactures of printed cotton, linen, silk, and woollen stuffs; leather, hats, liqueurs, earthenware, refined sugar, &c.; and is the grand centre, not merely of the commerce of Bohemia, but of an extensive and rapidly increasing transit trade. It owes this distinction to its situation on the Moldau, or principal arm of the Elbe, which is navigable by large boats to Budweis (80 m. direct dist. S. from the city), where it is joined by a railway from Lintz, on the Danube. Prague is thus rendered the centre, as it were, of the communication between Hamburg on the one hand, and Vienna on the other; and is, besides, intimately connected with Dresden, Leipsic, and other German cities. Several annual fairs are held here, including a large wool fair in June.

"Owing to the number of its palaces, churches, public buildings, and other splendid remains of its ancient grandeur, Prague is more imposing than Vienna, and far preferable as a residence; the situation being much more salubrious, and the climate more mild and equable, the cold in winter rarely exceeding 24° Reaum., and generally averaging between 7° and 10°; while, during the greatest heat of summer, the thermometer seldom rises above 25°. Dr. Stultz, a celebrated German physician, who has written upon the relative salubrity of German towns, considers Prague as one of the most healthy in the empire, and affirms that it is no uncommon occurrence for the inhabs. to attain the age of 100, and even, sometimes, 115. Provisions are good and cheap; and an excellent red wine resembling Burgundy is produced in the neighbourhood. The theatre equals that of Vienna, and the musical department and orchestra cannot be too highly praised. Public and private concerts are also very frequent; and, except Vienna, there is no town in Germany where music is cultivated with so much success; indeed, this taste may in the Bohemians be termed truly national, for they excel both in vocal and instrumental music; and not a few of the natives travel to Italy, acquire the language, Italianize their names, and make large fortunes in Vienna. The harp appears to a stranger their native instrument; for we meet with itinerant harpists in every part of the country, whose strains generally accompany the midday repast at every inn, however small, whether in the capital or the provinces. Their language, which is rich and expressive, is also musical, and sounds as pleasing as the Italian when wedded to melody." (*Spencer's Germany and the Germans*, i. 207-8.)

Jerome, the friend of the great Bohemian reformer John Huss, was a native of this city, and was thence surnamed "of Prague." He suffered the same fate as his illustrious friend, having been burnt alive, in pursuance of a sentence of the Council of Constance (see CONSTANCE), on the 30th of May, 1416. A very interesting account of the unfair and barbarous treatment he experienced on his trial, and of the singular ability, courage, and eloquence with which he defended himself, and exposed the malignity and bad faith of his adversaries, is given in a letter of Poggio-Bracciolini, who was present on the occasion. (This interesting document may be seen in *Shepherd's Life of Poggio*, or in the art. *Jerome*, in *Aikin's Biographical Dictionary*.)

Prague is very ancient; but the date of its foundation is uncertain.

Bohemia is one of the few countries in which persecution has been successful. At one time the Protestant faith was that of a great and decided majority, not of the citizens of Prague only, but of the whole kingdom. But the sovereigns of Austria having succeeded, in 1526, to the Bohemian crown, succeeded, after a lengthened struggle, partly by force of arms and partly by the most atrocious persecution of which history has preserved any account, in exterminating every germ of the reformed faith, and in totally subverting the free institutions of the country. For more than 150 years the language of the people was proscribed, their spirit was broken, and they were subjected to every species of insult and indignity. But since the middle of last century, and especially since the reign of Joseph II., the government has been conducted in a more tolerant and liberal spirit: and Prague, with the rest of Bohemia, is now advancing as rapidly in prosperity as any part of the Austrian monarchy. Prague was taken by the

PRATO.

ians under Frederick the Great in 1741, but they soon after obliged to evacuate the city, and it has since been held by the Austrians. (*Oesterr. Nat. G.*; *Bergmann*; *Koeh's Sketches of Bohemia*, in *op. Mag.*, 1837; *Turnbull, Strong, Giegl, Murray*, *maxim*.)

ATO, a town of the grand duchy of Tuscany, cap. on the Bisenzio, a tributary of the Arno, 10 m. Florence. Pop., in 1856, 10,849. It is surrounded by a wall and ditch; the streets are regular, and the air generally good. It has several squares, of which the chief is the Piazza Mercatale; but the chief ornament of the town is the cathedral, a fine edifice of white marble, with ornamental parts of dark serpentine. Several other churches are handsome, and worth notice. It has two workhouses, several hospitals, the Clog-college for secular instruction, normal Lancasterian infant schools, &c. The manufacture of straw hats and bonnets employs nearly 1,000 females; and it has manufactories of woollen stuffs and caps, the latter for exportation to the Levant; with iron and copper works, paper-mills, a rope-walk, a glass factory, &c. The average wages of the working classes at Prato may be reckoned at 24 paoli, or 10½ d. a day. (*Bourving's Rep. on Sewing*, p. 34, 35.) In the middle ages, Prato was the seat of a republic, conquered by the Florentines in 1353. The post Casti was a native of the town. (*Woods's Works*, v. *Camden's Italy*; *Boschini's Rev.*; *Geog. Dict.*)

KAYA (PORTO), a sea-port town of the Cape de

RENZLOW, a town of the Prussian states, the chief town in that part of Brandenburg called the Ucker Mark, the point where the river Ucker escapes from the lake of that name, 37 m. W S.W. Statin Pop., in 1877, 10,508. A thriving and well built, has various churches, schools, hospitals, a valuable public library, and manufactures linen, woollens, and tobacco, with breweries, tanneries, &c. In 1806, a conflict took place in the suburbs of the town, which ended in the surrender to the French 20,000 Prussian troops, escaped from the battle of Eylau.

PRESSBURG, or PRESSBURG, (Hungar. *Pozsony, Posonium*), a royal free town, and formerly the cap. Hungary, and still the seat of the Diet, immediately on its W. frontier, cap. co. of its own name, on the bank of the Danube, 34 m. E. by S. Vienna, lat 48° 50' N., long. 17° 6' 15' E. Pop. in 1837 (excluding frieze and strangers), 37,360. Travellers differ greatly in their statements as to the appearance of Pressburg; the latest and best authority, Mr Paget, says it is situate along the banks of the Danube, and, for town of its size, offers a greater number of handsome buildings than are often seen together. It has, however, more of the characteristics of a German than a Hungarian city, and has few public buildings worth notice. The most conspicuous of the latter is the castle, a huge mass of brick structure, built upon a height above the town. It is now a ruin, having been burnt in 1811, by an allied regiment in the French service; it is, however, memorable as the scene of the appeal made in 1741 by Maria Theresa to the Hungarian states, which was so generously responded to by the latter. The hall of the Diet, or *Landskammer*, is a plain unpretending edifice, both externally and internally. The two chambers, which constitute the Hungarian Diet, meet in apartments furnished simply with long tables, round which are benches for the members who speak, as in the H of C., from their places, and not, as in France, from a tribune. The lower chamber, visited by Paget, "is a long plain hall, covered in nearly its whole length by two tables covered with green baize, at which the deputies sit, with pens, ink, and paper before them. At the upper end is a raised part occupied by the president, vice-president, and secretary; and behind these sit the judges of the royal table." In the intervals between the sessions of the Diet, this apartment is used as a concert-room. The members attend the Diet armed, in full national costume, and, since 1825, the debates have not been carried on in Latin, but in Hungarian. They are sometimes very stormy. The cathedral, a Gothic edifice, supposed to date from the 11th century, and in which the kings of Hungary are crowned; the county-hall, German theatre, barracks, and archbishop's palace, are the other principal public buildings. There are several handsome noble residences, but they are seldom occupied, for Pressburg is not a favourite place of abode with the Hungarian nobility; and most of the members of the Diet, when assembled, live in lodgings, dining at one of the numerous *restaurants* in the town. Pressburg was formerly surrounded with walls, but it has long outgrown these, and they are now mostly demolished. It is a bishop's see, and the residence of the archbishop of Gran, primate of Hungary. It has a Rom. Cath. academy and a Calvinist lyceum, both possessing good libraries; a Cath. high gymnasium, Cath. seminary, college for poor students, and various other public schools; a hospital, including one supported by the Jews.

SECURITY, HULL DEVIATED CASE.

Prescot has long been celebrated for its manufacture of watch-tools and movements, in both of which branches it greatly excels: files, also, of first-rate quality, and engravers' tools, are made here. In 1836, 100 men were employed in file-making, and 500 in the construction of watch tools, motion work, &c. The manufacture of coarse earthenware has for many years been carried on, the clay of the neighbourhood being well adapted for such a purpose. Cotton-spinning is carried on in 2 mills, employing, in 1829, 240 hands; and there is a small flax-mill. Coal-mines are wrought in every direction round the town, it is estimated that upwards of 2,000 men are employed in the collieries within the par.; and Liverpool receives from Prescot its chief supply of coal. Many of the out-townships are very populous, St. Helen's and Eccleston having attained to some importance as manufacturing towns. Prescot has petty sessions, and a baronial court for the recovery of small debts. Markets on Saturday, and fairs on alternate Tuesdays. (See St. Helen's.) (*Baines's Hist. of Lancaster; Butlerworth's Stat. of Lancaster, &c.*)

PRESTEIGN, a pari. bor. and market-town of S. Wales, hund. New Radnor, co. Radnor, near the S. bank of the Lug, in a fertile and well-cultivated valley, adjoining the confines of Herefordshire, 12 m. E. by N. Leominster. The par. of Presteign, which extends partly into Wigmore hund., co. Hereford, had, in 1841, 2,208 inhab., of which the pari. bor. had 1,580. This is a well-built town, and, notwithstanding its limited size, is the cap. of the co., the assizes and quarter sessions being held in it. "A woollen manufacture was once carried on here; but that is now given up, and there is no manufacture at present in the town, unless it be that of malt, which is made in large quantities. It is a sort of metropolis of the country for 8 m. round, supplying it with groceries, drapery, iron-work, and shop goods in general. It has also a considerable trade in timber. The inhab. are principally professional men, tradesmen, mechanics, handicraftsmen, and a few farmers. There are also some persons of small independent incomes, who reside here for the sake of the cheapness of the place." (*Park Bount. Repert.*) The church, which is very ancient, has some curious monuments and fine old tapestry. The living

a rectory of the annual value of about 800*l.*, is in the gift of the Earl of Oxford. The Wesleyan and Primitive Methodists, and Baptists, have places of worship. The co. hall is said to be a handsome structure, and there is also a co. gaol and a free-school. The latter, founded and liberally endowed in the reign of Elizabeth by a clothier of the town, furnishes a plain English education to between 50 and 60 boys; and there are other minor schools and Sunday-schools attached to the Church and the Wesleyan connection. At the N. end of the town is a fine circular mound, laid out in public walks, presented to the inhabs. by the Earl of Oxford. Presteign unites with New Radnor and other small bors. in sending 1 mem. to the H. of C. Registered electors in the whole bor., in 1849-50, 487. It is governed by a bailiff and constables.

The Rev. Richard Lucas, author of the "Enquiry after Happiness," was a native of Presteign, having been born here in 1648. The work now referred to, which has passed through a great number of editions, and is still held in considerable estimation, was written after the author had become blind. (*Aikin's Biographical Dict.*)

PRESTON, a parl. and mun. bor., market-town, and par. of England, in its own div. of hund. Amounderness, co. Lancaster, on the N. bank of the Ribble, crossed here by 3 handsome bridges, 19 m. S. Lancaster, and 28 m. N.N.E. Liverpool. Area of parl. bor. (which comprises Preston and Fishwick townships), 2,660 acres. Pop., in 1831, 33,871; in 1841, 50,332. The town, which consists of a broad principal street, running N.E. from the river, crossed by several others in different directions, is "well built, well paved, with handsome dwelling-houses and thriving factories; having a perfect drainage, and good roads leading from it." (*Bound. Rep.*) The streets are well lighted with gas, and there is an abundant supply of water. The market-place, at the junction of Fishergate and Friargate, contains about 3,000 sq. yds. The public buildings comprise an elegant court-house, erected in 1836; an exchange or market-house, town-hall, assembly-rooms, theatre, borough prison, House of Recovery, and a large county penitentiary. The church, originally erected in the 16th century, was rebuilt in 1770: the living is a vicarage, of the annual value of 666*l.*, in the gift of the trustees of Hulme's charity. There are also 7 district churches, chiefly of modern erection, and 4 others have been built in the out townships. The places of worship for dissenters comprise 4 for Rom. Caths. (a numerous and increasing body), 2 each for Wesleyan Methodists, and Independents, with others for Unitarians, Huntingdonians, Primitive Methodists, Baptists, Sandemanians, and the Society of Friends; there being, in all, within the town, 8 churches and 17 dissenting chapels. National schools are attached to the several churches; and all or most of the dissenting places of worship have large Sunday-schools, furnishing religious instruction to between 7,000 and 8,000 children. A grammar-school, founded prior to 1688, has an endowment of 50*l.* a year; there is, also, a partially endowed blue-coat school, and several day and infant schools, supported by subscription. The other charities comprise 9 almshouses, and several money bequests; a dispensary, house of recovery, built in 1829; provident society, workhouse, and savings' bank. Among the literary establishments, the first place is due to the Preston Institution for Diffusing Useful Knowledge, which has a library of about 2,500 vols., and an excellent museum. The Palatine and Dr. Shepherd's libraries are open to all classes, and the town has a public law-library. An agricultural society was founded in 1811. Avenham Walk, on the summit of the hill which rises from the banks of the Ribble, is a favourite promenade, and is kept in order at the cost of the corporation. Two newspapers are published, each once a week.

Preston, from its central position, its vicinity to an important coal district, and its extensive means of communication with the interior by canals and railways, united to the skill and enterprise of its citizens, has of late years rapidly increased in wealth and pop., and is now, in fact, one of the great seats of the cotton manufacture. In 1838, there belonged to the town 35 cotton-mills, impelled by a steam power of 1,332 horses, and employing above 7,000 hands. It has, also, numerous hand-loom weavers, though owing to the competition of the power-loom, their wages had fallen in 1838 to about 7*s.* a week at an average. The manufacture of linen cloth, formerly the principal branch of industry in Preston, is still pretty extensively carried on; and in 1838, 6 flax-mills employed about 1,400 hands. It has also numerous iron foundries, and other establishments for making machinery and other articles. Leather is tanned in considerable quantities; and there is a small fishery on the Ribble, which abounds with salmon, smelts, and eels. Two banking companies have been recently established, and there are 3 private banks. The Ribble is navigable at spring tides, as far as Preston-marsh, for vessels of 150 tons; but, being ill adapted for sea-borne vessels, it is frequented almost exclusively by coasters. The navi-

gation, however, which is impeded by sand-banks, is in course of being improved by a company incorporated in 1837-38; and it is expected that a depth of 18 ft. water, at ordinary spring tides, will be attained. The river dues produce about 1,000*l.* a year. The Lancaster Canal, formed in 1796, passes the town; and it is connected with other parts of the co., and of England generally, by the North Union Railway (22½ m. in length), which crosses the Ribble on a viaduct of 5 arches, 68 ft. above the river, the Lancaster and Preston Railway, a portion of the great N. West line, the Preston and Longridge Railway, the Bolton and Preston Railway, and the Preston and Wyre Railway, which last connects it with the new seaport of Fleetwood, at the mouth of Wyre harbour, now rapidly rising in importance. Large markets on Saturday, with others on Wednesday and Friday for fish, butter, and vegetables. Great fairs in Jan., March, Aug., and Nov.; the first of which, called the "Great Saturday," is celebrated for its show of horses.

Preston is a bor. by prescription, and received its first charter from Henry II. By a subsequent charter, granted by Henry III., the officers of the bor. were authorised to hold a guild merchant for the renewing of the freedom of the burgesses, and other purposes. This privilege is made the occasion of great festivity. For a long time after their first institution, the guilds were held at irregular periods; but they have now for more than a century been uniformly celebrated every twentieth year, commencing on the Monday next after the decollation of St. John, which generally happens in the last week of August. The last was held in 1832. Processions of the corporation, and the different trades in characteristic dresses, as well as of ladies, and females employed in the factories, take place on two of the days; and the amusements, which are varied and interesting, continue for a fortnight. But for civic purposes, the guild books are open for an entire month. Under the Mun. Reform Act, Preston is divided into 6 wards, its municipal officers being a mayor and 12 aldermen, with 36 councillors. Corp. rev., in 1848-49, 8,106*l.* 15*s.* Quarter and petty sessions are held under a recorder. Quarter sessions for the hunds. of Amounderness, Blackburn, and Leyland are, also, held here, and there is a county court, before which 1,292 plaints were entered in 1845. Preston has sent 2 mems. to the H. of C. since the reign of Edward VI., the right of voting, down to the Reform Act, being in the inhabs. at large. The Boundary Act enlarged the electoral limits, so as to include the township of Fishwick with the old bor. Reg. electors in 1849-50, 2,653.

Preston is supposed to have risen on the decay of the ancient *Æturgonium*, or Ribchester, a city now reduced to the condition of a mere village, about 11 m. higher up the river; and it derived its name of *Priest's-town* from the number of religious houses established here, and of which there are still some remains. It was partly destroyed by Robert Bruce, in 1322. In the parliamentary wars of Charles I., its inhabs. declared for the king, and it was besieged and taken by Sir Thomas Fairfax. In 1715, the Jacobite insurgents took possession of the town, and erected barricades for its defence; but, after a brave resistance, they were compelled to surrender to the royalist force under General Willes. In 1745, Preston was visited by the Pretender, on his retreat; but he was compelled to withdraw on the approach of the Duke of Cumberland. (*Baines's Hist. of Lancashire*; *Butterworth's Stat. Sketch of Lancashire*, p. 109-113.; *Parl. and Bound. Rep.*)

PRESTONPANS, a bor. of barony and sea-port town of Scotland, co. Haddington, on the shore of the Frith of Forth, 7½ m. E. Edinburgh. In 1841, the par., which is one of the smallest in Scotland, had a pop. of 2,234, of whom the bor. had about 1,660. It is straggling and ill-built, consisting principally of a single street parallel to the Frith of Forth. It derives its name from its having, for a lengthened period, had a number of salt-works or pans for the production of salt by the evaporation of the sea water, and for the refining of rock salt. The latter branch of the business is now the only one that is carried on. It has, also, a brewery, at which some of the best Scotch ale brought to the Edinburgh market is produced, a soap-work, and two works for the manufacture of coarse pottery. There are extensive oyster beds in the vicinity of the town, whence the Edinburgh markets derive a large proportion of their supply. Morrison's Haven, the port of Prestonpans, about ½ m. W. from the town, is a small creek, with not more than 10 ft. water at springs.

Near this village, on the 21st of Sept., 1745, the royal army, under Sir John Cope, consisting of about 2,100 regular troops, was totally defeated and dispersed, with great loss, by the Highlanders, who were but little superior in point of numbers, under the Pretender. The king's troops being panic struck, threw away their arms, and fled at the first fire, and were cut down almost without resistance. (*Johnston's Memoirs of the Rebellion*, p. 34-38.)

PREVEŒA, a town of Turkey in Europe, prov. Al-

PRINCE EDWARD'S ISLAND.

at the entrance of the Ambracian Gulph, 56 m. V. Yanina. Pop. 4,000? It is ill built, badly paved, dirty; but it is in a good situation for commerce, as formerly the entrepôt of the trade of Epirus. A isthmus, connecting the peninsula upon which it is with the main land, are the remains of Nicopolis, a ring of the ancient walls, a theatre, some baths, various other vestiges of antiquity.

PRINCE EDWARD'S ISLAND, (formerly SAINT

PRINCE OF WALES'S ISLAND. 549

St. Lawrence. The town, on gently rising ground, is regularly built, and clean, with about 5,000 inhabs. The court-house, episcopal and Scotch churches, several chapels, the barracks, and the fort, are its only conspicuous public buildings.

This island was taken from the French in 1758. It was annexed with Cape Breton to the government of Nova Scotia in 1763, but since 1768 has formed a separate colony. (*Macgregor's America; Campbell's Report for*

PROVENCE, one of the former provs. of France, in the S.E. part of the kingdom, now subdivided into the déps. Basses-Alpes, Bouches-du-Rhône, Var, and a portion of Vaucluse.

PROVIDENCE, a city and port of entry of the U. States, Rhode Island, of which it is the cap., being, also, the second city of New England in point of pop., wealth, and commerce. It stands at the head of the tide-water in Narragansett Bay, about 30 m. from the Atlantic, 40 m. S.S.W. Boston; lat. $41^{\circ} 50' 40''$ N., long. $71^{\circ} 21' 30''$ W. Pop., in 1840, 23,171. It stands on elevated ground on both sides Providence River, an arm of the bay, here crossed by 2 bridges, one 90 ft. in width. It is a well-built, handsome, thriving town. Its chief public buildings are the state-house, Brown university, and the arcade. The last, which is the finest building of its kind in the Union, was finished in 1828; it is 222 ft. in depth; has 2 granite fronts 72 ft. in width, ornamented with Doric colonnades, and cost, in all, about 130,000 dolls. Providence has numerous churches, schools, and charitable institutions. Brown University, founded at Warren in 1764, and removed thither in 1770, comprises 2 colleges, and is governed by a board of trustees and fellows, all of whom must be Baptists. It has a library of 28,000 vols., and a very complete philosophical apparatus, and is attended by above 150 students. (*Amer. Almanack*, 1850.) The Friends have a boarding-school here, which has about 200 pupils. There are several literary societies, which possess libraries, &c., and many extensive private seminaries.

Providence is distinguished as a manufacturing town: its cotton factories employ from 12,000 to 14,000 spindles; and it has extensive bleaching-grounds and dye-houses; iron-foundries and machine-factories for the production of cotton machinery; with manufactures of combs, jewellery, glass wares, leather, boots and shoes, soap, candles, furniture, &c. Pawtucket, about 4 m. N.E., is also the seat of extensive cotton manufactures, the products of which find an outlet at Providence. Vessels of the largest burden come close to the wharfs, and the navigation of the bay is not often impeded by ice. In 1849, there belonged to this town 17,720 tons shipping.

Providence communicates with Boston, and with Stonington in Connecticut, by railways; with Worcester (Massachusetts) by the Blackstone Canal; and steamboats of a large class keep up a daily communication with New York. It was originally settled in 1636, by Mr. Roger Williams, to whom is ascribed the honour of having established the first political community in which perfect religious toleration was admitted. It was incorporated as a city in 1831. (*Encyc. Americana*; *Amer. Almanack*.)

PROVIDENCE, one of the Bahama islands, which see.

PRUSSIA, an important European kingdom, between the 49th and 56th deg. N. lat., and the 6th and 29d deg. E. long. The principal part of the Prussian dominions lies continuously along the S. shore of the Baltic, between Russia and Mecklenburg, comprising the N. part of what was formerly Poland, and most part of the N. of Germany. The inland frontier of this part of the monarchy on the E. and S. is sufficiently connected; but on the W. side it is very ragged, some small independent states being almost entirely surrounded by the Prussian dominions. But, exclusive of this principal portion, there is an extensive Prussian territory on both sides the Rhine, divided into the provinces of Westphalia and Rhine. This portion is separated from the rest of the monarchy, or from what may be called the Eastern States, by Hesse-Cassel, part of Hanover, Brunswick, &c. The Canton of Neufchatel, in Switzerland, and some detached territories in Saxony, also belong to Prussia.

Eastern Prussia has on the N. the Baltic; on the E. Russia, Russian Poland, and Cracow; and on the S. and W. the Austrian states of Galicia, Moravia, and Bohemia, with Saxony, and other German states. West Prussia, or the provinces on the Rhine, have on the N. and E. Hanover and other German states; on the S. France; and on the W. Belgium and the Netherlands. From the extreme eastern frontier of Prussia to Aix-la-Chapelle, in an E.N.E. and W.S.W. direction, the distance is about 775 m.; and from the promontory on the Baltic, above Stralsund, to the extreme southern frontier of Silesia,

in a N.E. and S.W. direction, the distance is 404 m. Owing, however, to the irregularity of the frontier, and the intervention of other countries, these measurements give no information as to the extent of the monarchy.

The disjointed state of the dominions of Prussia detracts materially from her power. The possession of Warsaw gives Russia a position whence she may attack the very centre of the monarchy. An alliance with Saxony would bring an Austrian army within a few days' march of Berlin; and the Rhenish provinces are exposed to be overrun by France. The government, aware of the weakness occasioned by the circumstances now alluded to, have systematically laboured to give a more compact form to its dominions. But they have only partially succeeded; and it is, in consequence, necessary for the public security that the military establishment should be placed on a very imposing footing.

Aggrandisement of Prussia.—The rise of the Prussian power has been rapid and extraordinary. The kings of Prussia are descended from petty German princes, who, in the 14th century, were burgraves of Nuremberg. In 1415, Sigismund, emperor of Germany, sold the marquisate (afterwards electorate) of Brandenburg to Frederick, one of these burgraves, for 400,000 ducats, who, by this purchase, laid the foundation of the future grandeur of his family. (Pfeffel, *Histoire d'Allemagne*, anno 1417.) In 1515, Albert, margrave of Brandenburg, was elected grand master of the Teutonic knights, who then possessed Ducal Prussia; and by a treaty concluded in 1525, this territory was secularised and erected into a duchy in favour of Albert and his successors. (Pfeffel, 1525.) In 1657, Prussia was acknowledged by Poland to be a free and independent state; and, after other aggrandisements, it was advanced to the dignity of a kingdom in 1700. Part of Pomerania was not long after added to Prussia.

But notwithstanding these acquisitions, when Frederick the Great ascended the throne, in 1740, his disjointed dominions did not contain 2,500,000 inhabs., who had made but little progress in the arts, or in the accumulation of wealth. But this extraordinary man, with no extrinsic assistance, and by mere dint of superior talent, wrested, in the early part of his reign, the valuable and extensive province of Silesia from the house of Austria. He afterwards defended himself, during the seven years' war, against the combined efforts of Austria, Russia, and France, and forced these powers to conclude a treaty, by which Silesia was solemnly guaranteed to Prussia. In the latter part of his reign, in conjunction with Russia and Austria, Frederick planned, and partly carried into effect, the partition of Poland, acquiring as his share the western parts of Prussia, and secured, in addition to the increase of territory, an unrestricted communication between the different great divisions of his kingdom.

By these different acquisitions, Prussia, at the death of Frederick, in 1786, had been increased in size nearly a half; while, owing to the superior fertility of the conjoined provinces, and the improvement effected in every part of his dominions, after the peace of 1763, the pop. had increased, according to the estimate of the Prussian writers, to about 6,000,000.

Prussia acquired by the subsequent partition of Poland in 1792, and its final dismemberment in 1795, a great extension of territory, including the important city of Dantzic, and upwards of 2,000,000 inhabs. In addition to this, she acquired the bishopric of Paderborn and the principalities of Bayreuth and Anspach, with several lesser districts in Germany; so that in 1805, according to the statement of Krug, she contained nearly 8,000 geog. sq. miles of territory, and a pop. of 9,640,000.

Her disastrous contest with France in 1806, and her subsequent humiliation, are well known. But the spirit of the people was not subdued; and after Napoleon's campaign in Russia, the pop. rose en masse, and the zeal and bravery of the Prussians were mainly instrumental in effecting the final overthrow of Napoleon. At the general peace of 1815, Prussia became more powerful than ever. She recovered all her former possessions, except a portion of her Polish dominions assigned to the kingdom of Poland; but this was more than compensated by valuable acquisitions in Saxony, Pomerania, and the Rhenish provinces.

Considering, however, the importance of Prussia, as a counterpoise to Russia on the one hand, and to France on the other, it were to be wished that her territories were both more extensive and more compact. One of the greatest faults committed by the congress of Vienna was the diminution of the acquisitions of Prussia in Poland. This was to be regretted, as much on account

of the general interests of Europe, which requires that Prussia should be a power of the first order, as of the inhab. of the provinces separated from her dominions.

Divisions and Extent of the Country. Population.—The Prussian monarchy is divided into 9 provinces, and

these again into 28 regencies, which are further subdivided into 336 circles. Each regency takes its name from its principal city, as is seen in the following Table, which also shows their extent and population at different epochs.

Account of the Provinces and Regencies of the Prussian Monarchy in 1849, specifying their Extent in Geographical and British Square Miles; and their Population in 1816, 1825, 1840, and 1849.

Provinces and Regencies.	Area in Geog. sq. Miles.	Area in British sq. Miles. 60-15 to a degree.	Pop. in 1816.	Pop. in 1825.	Pop. in 1840.	Pop. in 1849.

	487-14	10,208	1,245,848	2,067,563	2,763,080	2,814,372
Total area and inhab.	1,060-45	107,300	10,189,889	12,075,657	16,112,948	16,385,015

To which adding 46,174 for troops out of the country, the total pop., in 1849, will be 16,331,187.

Face of the Country. Mountains.—The surface of the Prussian states is generally flat. With the exception, indeed, of part of the Hartz Mountains, in the prov. of Saxony, the Teutoburger Wald, and some other mountains in Westphalia and Saxony, the volcanic district in it and the Lower Rhine, and the Rhenishgebirge, or Giant's Mountains, on the S.W. confines of Silesia, there is no other tract that is more than hilly. Prussia is, in fact, a country of vast plains; and is in most parts so very level, that many marshes and small lakes have been formed by the inundations of the rivers. The eastern, or principal part of the monarchy slopes imperceptibly from the S. frontier towards the Baltic, the shore of which is low and sandy. From this circumstance, and the nature of the soil, which in many places consists of little else than mere loose sand, some geologists have supposed that the sea had at one time overspread the greater part of its surface; and there would seem to be considerable plausibility in the supposition. At a comparatively recent period the country was covered in most parts with immense forests, of which there are still very extensive remains. These, when they belong to the crown, are under the control of the administration of forests.

Soil.—The quality of the soil is very various. In Brandenburg and Pomerania it is generally poor; in many parts, indeed, it consists of tracts of loose barren sand, diversified with extensive heaths and moors; but, in other parts, particularly along the rivers and lakes, there is a good deal of meadow, marsh, and other comparatively rich land. In Ducal Prussia and Prussian Poland, including the prov. of Posen, the soil consists generally of black earth and sand, and is in many parts very superior. But Silesia, and the Saxon and Rhenish provs., are naturally, perhaps, the most productive. The plain of Magdeburg, on the left bank of the Elbe, is, perhaps,

the Curische Haff and the Frische Haff, on the coast of Ducal Prussia, and the Haff at the mouth of the Oder.

Seaports.—The principal sea-ports are Memel, Königsberg, or rather Pillau, Dantzic, Stettin, and Stralsund. With the exception of Stettin, or rather of its outport, Swinemunde, the water at these ports is rather shallow, seldom exceeding from 10 ft. to 12 ft. But at Swinemunde there are from 19 ft. to 21 ft.

Climate.—The climate of Prussia is not less various than the soil. Along the Baltic it is moist, and in Ducal Prussia, especially, the winter is long and severe. It is also severe in the S. parts of Silesia, contiguous to the Carpathian Mountains. In N. Silesia, Brandenburg, and the Saxon and Rhenish provs., it is comparatively mild.

Minerals.—The Prussian monarchy is richer in minerals than might have been anticipated from its flatness. Iron is the most generally diffused. It is very extensively wrought in Silesia, principally on account of the crown, but also by private individuals. The iron-works in the Rhine provs., near Dortmund, Solingen, Iserlohn, &c., and those near Schmideberg, Tarnowitz, Sprottau, &c., in Silesia, are very extensive. Coals are very abundant in the Rhenish provs., Saxony, and parts of Silesia, and large quantities are annually produced. Salt, which is a government monopoly, is produced principally in the Saxon provs., which also yield considerable quantities of copper, and some silver. Silesia furnishes annually large quantities of zinc, lead, and tin; but the last-mentioned metal is partly, also, supplied by Brandenburg. Amber has long been known as a product of Ducal Prussia. It is principally formed along the low narrow tongue of land between the Curische Haff and the sea.

If we distinguish the mineral products into I. metals; II. combustible minerals; III. stones; IV. clay, sand, earth; V. salt, alum, &c.,—we have in Prussia

I. Metals.

Silver, in Saxony (Maarfeld); Westphalia (Siegen); Silesia. *Copper*, Saxony (Maarfeld), Westphalia (Siegen); Silesia. *Lead*, Silesia, Rhine, Westphalia, Saxony. *Iron and steel*, in every province, but principally in the mountains of Silesia, Westphalia, and Rhine. *Cobalt*, Westphalia (Siegen), and Saxony. *Arsenic*, Silesia. *Chalcum and zinc*, Silesia, Rhine, and Westphalia.

II. Combustible Minerals.

Sulphur, Silesia. *Amber*, Prussia. *Pit-coal*, Silesia, Westphalia, Rhine, Saxony. *Brown-coal*, Saxony and Rhine. *Turf*, in every province, principally in Brandenburg.

III. Stones.

Amethyst, agate, in Silesia. *Alabaster*, Saxony. *Marble*, Westphalia, Saxony, Rhine, Silesia. *Volcanic topus*, Rhine province, and very important. *Serpentine stone*, Silesia. *Of sandstone, mill stones*, in Silesia, Saxony, Westphalia, Rhine. *Grinding, or whet-stones*, in Westphalia, Silesia, Saxony. *Limestones*, in Silesia, Westphalia, Rhine, Saxony, Brandenburg.

Gypsum in the same provinces as limestone. *Slates*, Westphalia and the Rhine.

IV. Clay, Sand, Earths.

Porcelain earth in Saxony, near Halle. *Pipe-clay and fuller's earth*, Silesia. *Sand*, suitable for the fabrication of glass, in all provinces. *Brick-clay and marl*, in all provinces.

V. Salt.

Kitchen salt, in Saxony, Westphalia, Pomerania, Rhine. *Alum*, Silesia, Saxony, Westphalia, Rhine, Brandenburg. *Saltpetre*, in some provinces.

In 1835, there were produced in the monarchy 184,280 cwt. zinc., 1,653,217 cwt. iron, 10,896,433 tons coal, 181,534,150 lbs. salt, &c. The total value of the minerals produced in that year has been estimated at 9,196,366 rix-doll.

Vegetable and Animal Productions.—These do not differ materially in Prussia and Great Britain. Rye and wheat, with buck-wheat, oats, barley, potatoes (now very extensively cultivated), and flax and hemp, are the principal products of Prussian agriculture. About 700,000 eimers of very fair wine are made in the Rhenish provs. It is mostly consumed in the country, the exports being so very trifling as not to exceed from 5,000 to 6,000 eimers a year. The average price of Prussian wine may be estimated at from 15 to 20 rix-dollars per eimer. The animals of Prussia are the same with those of this country, except that wolves and wild boars, which were long since exterminated in Great Britain, continue to exist in considerable numbers in the Prussian territories.

Agriculture.—Down to a comparatively recent period, the state of landed property in Prussia, and the condition of the occupiers of the soil, was similar to its state and their condition in most parts of continental Europe. The country was mostly divided into pretty considerable estates; and down to 1807, none but nobles or privileged persons could acquire landed property. Such parts of an estate as were not in the immediate possession of the lord were held by occupiers, in a sort of predial slavery, on condition of their paying a certain rent, consisting sometimes of services to be performed on the lord's land, sometimes of the delivery of a certain proportion (generally a half) of the produce, and more frequently, perhaps, of both the one and the other. In some places the tenants had acquired a sort of hereditary right to their possessions on their making the accustomed payments; but in other parts the title to the lands they occupied was only for life or for a certain number of years; though, by a most absurd regulation, the proprietor could not then resume the lands into his own hands, but was obliged to re-let them to an occupier of the same grade as the one who had left them! In 1807, however, the regulation which prevented peasants, tradesmen, &c., from acquiring land was abolished; and in 1811 appeared the famous edict which enacted that all the peasants who held perpetual leases, on condition of paying certain quantities of produce, or of performing certain services on account of the proprietors, should, upon

Territorial Division of Prussia after the most exact Data.

Total in Acres -	29,782,444	636,427	8,984,373	10,551,906	14,996,627	2,264,629	2,473,902

giving up one third part of the land held by them, become the unconditional proprietors of the other two thirds! And with respect to the other classes of peasants, or those who occupied lands upon life-leases, or leases for a term of years, it was enacted that they should, upon giving up half their farms, become the unconditional proprietors of the other half! This edict certainly effected the greatest and most sweeping change that was ever peaceably effected in the distribution of property in any great country. It was regarded at the time, and in some respects justly, as a dangerous interference with the rights of individuals. But the abuses which it went to eradicate were so injurious to the public welfare, and were, at the same time, so deeply seated, that they could not have been extirpated by any less powerful means. It has given a wonderful stimulus to improvement. The peasantry, relieved from the burdens and services to which they were previously subjected, and placed, in respect of political privileges, on a level with their lords, have begun to display a spirit of enterprise and industry that was formerly unknown.

Formerly, also, there were in Prussia, as there have been in England and most other countries, a great extent of land belonging to towns and villages, and occupied in common by the inhabs. While under this tenure these lands rarely produce a third or fourth part of what they would produce, were they divided into separate properties, and assigned to individuals, each reaping all the advantages resulting from superior industry and exertion. The Prussian government being aware of this, has succeeded in effecting the division of a vast number of common properties, and has thus totally changed the appearance of a large extent of country, and created several thousand new proprietors. The want of capital and the force of old habits rendered the influence of these changes at the outset less striking than many anticipated: but these retarding circumstances have daily diminished in power; and despite the too great extension of the potato, it may be safely affirmed, that the country has made a greater progress since 1815 than it did during the preceding hundred years.

The frequency of mortgages, and the embarrassed

of great numbers of the landed proprietors, are, however, loudly complained of. Perhaps the extent of the evil is exaggerated; and we incline to think, that no inconsiderable degree is attributable to the institution of land-banks, or rather of associations for the use of money on the security of land. These associations were established with the most laudable intention: but the facilities they have afforded of contracting debt, coupled with the little risk there is of the land ever being demanded, provided interest be paid, have tempted many individuals to indulge in excessive expenditure, and have made them injurious than otherwise.

used to be in Prussia an article of universal consumption, occupying the same place there that wheat is in England, and potatoes in Ireland. But we try to have to state that of late years it has been, to a great extent, superseded by the potato, the culture of which has increased with a rapidity to which there is no parallel. It now, in fact, forms the principal dependence of a large proportion of the pop. In proof of this it is enough to state that while the well-informed Prussian official, M. Dieterici, estimates the value of the produce of the various corn crops in Prussia, inc. wheat, etc., etc., circa 1846, at 179,166,000 th., he estimates that of the potato crop only at nearly double that or at 341,000,000 th. This wonderful extension of potato cultivation sufficiently accounts for the rapid increase of pop. in Prussia. But it gives, at the same time, the most unfavourable view possible of the state of the pop. It is not easy to see how it can avoid falling into something like the wretched condition of the pop. of Ireland. Indeed several districts in the Rhine prov. are involved in extreme distress by the failure of the potato crop in 1846. (*Le Prussien, son Progrès Politique*, t. 433.) The usual agricultural course is to fallow the third year, taking either first a crop of rye, and wheat, or conversely. The greater part of the wheat shipped at Danzig is brought from the Polish provinces under Russia and Austria. Flax and hemp are raised for domestic use, and also for sale, in all parts of the monarchy, but especially in Silesia. The best flax used from foreign seed, the seed produced at home is used to make oil-cake. Tobacco, hops, madder, and other plants used in dyeing, are also raised. Chicory is largely cultivated. Beet-root plantations are very extensive, and have recently made great progress, especially in Saxony and Silesia.

will be seen from the following account of the quantity of beet-root and colonial sugar consumed in the Prussian, or German Customs Union, in the 8 years ending with 1849, that the produce of the former has more than doubled since 1842.

	Beet-root Sugar.	Colonial Sugar.	Prop. of Beet-root to latter.
1842	985,914 cent.	1,099,841 cent.	11.3
1843	194,580	1,212,738	9.3
1844	216,380	1,286,339	14.6
1845	185,708	1,307,590	13.7
1846	296,451	1,147,130	20.5
1847	373,390	1,265,753	29.1
1848	511,781	1,085,491	41.6
1849	669,781	830,000	41.6

Prussia is supposed to produce about a half of this quantity.

except on the crown estates, there are few farms. A considerable landed proprietors are accustomed to manage their estates by stewards; and, as already seen, smaller occupiers are mostly all proprietors. It is possible to form any accurate estimate of the produce of the soil, differing as it does so very widely in fertility, culture, &c. In the most fruitful and best cultivated districts, as near Magdeburg, the produce of wheat reckoned at from 14 to 16 scheffels the morgen (1 scheffel = 6 bushels; 1 morgen = 1.53 acre); whereas, in Brandenburg and Pomerania, the produce of wheat is not reckoned at more than from 6 to 10 scheffels the morgen; the produce of rye varies in the best districts from 4 to 6 per morgen. But in the sandy and sterile portions of Pomerania, Brandenburg, and W. Prussia, the produce is often not more than 2 or 3 sch. per morgen. The rent of cultivated land is as various as the crops, being dependent partly on soil and partly on situation. In the immediate neighbourhood of Berlin, the best lands yield a rent of 14 rix-dollars per morgen; in the country around Magdeburg the rent is in general about 10 r.-d. per morgen; in Brandenburg, if it be not in the neighbourhood of Berlin, the rent is seldom more than 3 r.-d. per morgen; and in the sandy and sterile tracts, the rent is sometimes not more than 1 or 2 silver groschen per morgen. Horses, cattle, and sheep are raised everywhere throughout Prussia. The growth of the latter has been late years an object of much attention, particularly in Brandenburg, Saxony, and Silesia. In consequence of improvements effected by the introduction of merino sheep into Germany, the wool of Saxony, Silesia, and

some other provinces, has become superior even to that of Spain. The fall in the price of corn, subsequent to 1815, gave a great stimulus to this branch of industry. Wool now constitutes, in fact, the principal article of export from Germany, and has been productive of much wealth to many Saxon and Silesian proprietors, as well as to many in other provinces. The number of sheep in the Prussian dominions in 1843, amounted to 16,235,890, and the total produce of wool to from 90,000 to 110,000 quintals, of which about a third part is exported. In the same year the kingdom had 1,564,864 horses, 5,042,010 black cattle, and 2,115,212 hogs.

Manufactures.—Though more of an agricultural than a manufacturing country, Prussia has greatly distinguished herself, particularly of late years, in various branches of manufacture. The Rhenish provinces, Saxony, and Silesia, are the principal manufacturing districts.

The principal manufacturing district of Prussia, and, probably of the continent, is in the Rhenish provinces on the Wupper, having Elberfeld and Solingen for its principal towns. It is well supplied with coal and water power; and the inhabitants are alike industrious and inventive. The pop. of Elberfeld, inc. Barmen, has increased during the present century from 11,730 to 67,940; and the progress of many of the other towns and villages in the vicinity has been hardly less remarkable. Some of the manufacturing establishments in the Rhine district are on a large scale, employing from 400 to 800 work-people. The first steam-engine used in Prussia was set up in 1780. In 1840, there were about 450 steam-engines in the monarchy, of which above 30 were in Berlin. The wages of the work-people employed in manufactures vary according to the work to be performed, the expense of living, &c. At Elberfeld, weavers earn from 2 to 3 rix dollars, or from 6s. to 9s. a week, working from 10 to 12 hours a day. Children employed in factories make from 2s. to 4s. a day. We subjoin an official return of the looms at work in the different provinces of the monarchy in 1843, specifying the departments in which they were employed. [See next page.]

Commerce.—The exports from Prussia consist principally of corn, wool, timber, Westphalian hams, zinc, flax, bristles, salted provisions, and other articles of raw produce; with linen and woollen cloths, silk wares, iron and hardware, jewellery, watches, and wooden clocks, Prussian blue, spirits, beer, &c. The imports consist chiefly of sugar, coffee, and other colonial products, raw cotton, and cotton twist and stuffs, indigo and other dye stuffs, spices, French and other wines, coals for the use of the ports on the Baltic, salt, &c. The

Account of the Number of Looms for the Manufacture of Silk, Cotton, Wool, Linen, and Stuff, in the different Provinces of Prussia in 1843.

N.B. The looms in the columns marked * are those in the houses of the peasantry, and are employed only occasionally, as a secondary or supplemental business. Hence they are most numerous in the backward and least manufacturing provinces.

amount of the trade of Prussia cannot, owing to the free system of internal commerce now established in Germany, be ascertained with any precision; but it is very considerable, and is rapidly increasing. Except in dear years, when we are large importers of corn, our trade with Prussia is principally carried on at second-hand through Hamburg, Bremen, and the Netherlands ports. But we have elsewhere shown that the real value of our exports to Prussia may be fairly estimated at nearly 3 millions a year. (*Commercial Dictionary*.) Besides the facilities afforded to internal commerce by the rivers and canals already alluded to, others of a very important nature have recently been furnished. Previously to 1815, the roads in Prussia were, with few exceptions, about the very worst in Europe. They were, in fact, mere pathways, without any artificial construction; and owing to the loose sandy nature of the soil, the wheels not unfrequently sunk in them to the axle, and the carriage was drawn rather through than over the ground. But since the period alluded to, a very great change has been effected. New roads, constructed on the most approved principles, macadamised, and equal to any in England, are now carried from Berlin to all the most distant parts of the monarchy. The cross roads have also been materially improved; and every day is adding to the means of communication thus afforded. In all, about 1,200 Germ. miles of road have been constructed since 1815, three fourths of which have been made at the expense of government, and the rest by the country districts. Mail coaches, which travel at the rate of about six miles an hour, are established along the principal lines of road. They are under the orders of government, and are well conducted. All travelling charges are regulated by a tariff fixed by the police. Railways have been opened, or are about to be, from Berlin to Potsdam, and from Cologne to Aix-la-Chapelle; and others either have been opened, or are in the course of being constructed.

More recently Prussia has been traversed by some very important railways. On the 1st January, 1847, the agg. length of the different railways that were then open in the kingdom, amounted to 1,141 Eng. m.; 572 m. were then, also, in the course of being constructed; while plans for 628 m. additional had been adopted. Perhaps, we may estimate the total length of the railways now (1850) open in Prussia at about 1,800 m.; and but for the disturbed state of the country during the last two years sundry additional lines would have been completed. The state does not interfere with the construction or working of railways; but it reserves power to purchase them at a fair price at the end of 30 years. (*Lardner on Railways*, p. 469, &c.)

Within the last few years Prussia has prevailed on by far the greater number of the secondary and smaller German states to enter into a commercial league, by adopting a uniform tariff of duties on imports, and establishing a free system of internal commerce. Previously to the adoption of this plan, each petty state had its own custom-house, and its own system of duties and revenue laws: these frequently differed widely from those of its neighbours, so that the internal trade of the country was subjected to all the vexatious restrictions that are usually laid on the intercourse between distant and independent states, and was, in consequence, comparatively trifling. But these restraints are now entirely got rid of. Internal custom-houses and separate custom duties no longer exist. Each state participates, in proportion to its pop., in the amount of the duties collected at the frontiers of the league; and a commodity admitted at any one of the external custom-houses, may be subsequently conveyed, without let or hindrance, from Aix-la-Chapelle to Tilsit, and from Stettin and Dantzic to the frontiers of Switzerland and Bohemia. It has been supposed by many that this system threatened to be very injurious to the trade of Britain and Germany; but there seems to be no ground whatever for any such apprehension. The freedom of internal commerce will do more to promote the prosperity of the countries included within the league, than any other measure their rulers could have adopted; and, as

population increases, and the inhabitants become more wealthy, there will, no doubt, be an augmented demand for foreign products. Generally speaking, the duties are moderate. It is, indeed, obvious that were any attempt made to raise them to an exorbitant height, the facilities for smuggling along the frontiers of the league are so very great that its territories would very speedily be deluged with overtaxed products. And in addition to this signal reform, the tolls and other impediments that formerly obstructed the free navigation of the Rhine to the Elbe are now mostly removed; and there are no longer any exclusive companies, or incorporated guilds or bodies, to obstruct the general freedom of industry and competition.

Shipping.—Considering the extent of sea-coast possessed by Prussia, and the facilities she enjoys for ship-building, the shipping is not very considerable. In 1850, there belonged to the different Prussian ports 977 sailing ships, of the burden of 183,638½ Pruss. tons, besides 21 steamers; and exclusive, also, of small coasting vessels and river boats. Stettin, Stralsund, Dantzic, and Königsberg are the principal ports.

Money, &c.—Accounts are kept in rix-dollars, or thalers, of 30 silver groschen. Each rix-dollar should contain 257·68 gr. fine silver, and is worth 2s. 11½d., but is generally taken at 3s. The centner, or quintal of 110 lbs., is equal to 113·381 lbs. avoirdupois. The last, by which ships' tonnage and freights are estimated, contains 4,000 Prussian lbs. One Prussian mile is equivalent to 4·68 English miles. The morgen is equal to 1·52 imp. acres. For an account of the bank of Berlin, see *BERLIN*.

Races; Population.—The people of Prussia belong mostly to the great German and Slavonian families; the Poles in Posen, W. Prussia, &c. belonging to the latter, and the great bulk of the inhabs. in the other districts to the former. German is the language of the court, and of all the better informed classes in all parts of the kingdom. We have seen that the pop. of the monarchy, exclusive of Neuschâtel, has increased from 10,349,081, in 1816, to 16,331,187 in 1849. As only about 35,000 of this augmentation is due to an enlargement of territory (the Duchy of Lichtenberg, acquired in 1834), it is a more rapid rate of natural increase than has taken place during the same period in any other continental country.

No doubt a considerable portion of this increase may be ascribed to the changes already noticed in the distribution of property. It is more than doubtful, however, whether the influence of this change will continue to be as advantageous as it has been hitherto. With few exceptions, there are neither entails nor majorats in Prussia; but when an individual dies, his property, whether it consist of land or moveables, is *equally divided* among his children, without respect to sex or seniority. The influence of this law in causing the splitting of property was limited, previously to 1807, by the regulation that none but nobles could hold land. But, as it may now be held by any one, the system of equal partition will exert its full force; and there is but too much reason to fear that, in the end, it will occasion the too great subdivision of landed property, and an excess of agricultural population.

We regard this as being, next to the extension of the potato cultivation, the most formidable of the unfavourable contingencies to which Prussia would seem to be exposed; and unless it be met by the organisation of such a system of poor laws as will make it for the interest of the proprietors to oppose themselves to a too great subdivision of the land, and a too rapid increase of population, the consequences may be most disastrous. Already, indeed, there are in several quarters unequivocal symptoms of an excess of population. This is a matter to which the attention of government cannot be too early and steadily directed.

Government.—Previously to 1823, the government of Prussia was a pure monarchy. The succession was hereditary in the direct male line; and the prerogative of the prince, which was nearly absolute in theory, was limited

privileges of the different ranks and of the people, and still more by their intelligence and the power resulting from their organisation. During the war which ended in the liberation of the country from domination of the French, the late king was obliged to grant, on the expulsion of the invader, liberal institutions to his subjects. But the performance of these promises was delayed, by pretence and another, till 1823, and was very imperfectly fulfilled by the institution of provincial states, whose powers were exceedingly circumscribed, and who, also, deliberated in secret. An institution of this sort, far from satisfying the reasonable demands and wishes of the people, served only to give them more discontent.

It was expected that on his accession to the throne, the reigning monarch would have granted some important constitutional concessions, and this expectation not being realised, demands for an extension of popular privileges were presented from some powerful bodies; and it became obvious that a change to more liberal institutions could not be postponed much longer. At length, in February, 1847, an ordinance was issued, by which his Prussian Majesty converted the separate provincial states into a general diet or parliament, vested with very considerable powers. And it is probable, but for the events that occurred in France in the month of February, 1848, that the form of government established by the ordinance of 1847, would have been gradually consolidated and modified to suit the wants and habits of the people. The influence of the occurrences in Paris altered the course of this safe and progressive movement, and gave a stimulus to revolutionary principles and projects which the government could not either the ability or the power to counteract.

In consequence, the measures of the representative body assembled at Berlin, indeed, no doubt, in a considerable degree by the weak and vacillating conduct of the king, had a decidedly revolutionary cast. The latter, however, disgusted by the conduct of the assembly, and encouraged by the check given to the revolutionists at Vienna, changed the place of the meeting of parliament from Berlin, where it was regarded as a great measure at the beck of the mob, to Stettin, and then pronounced its dissolution.

But fearing, apparently, the consequences of this tardy though necessary step, he, at the same time (5th December, 1848), issued the outline of a programme of a new constitution, in which he certainly bid high for popularity. This constitution having been revised was definitively promulgated at Berlin on the 1st of February, 1849, and was sworn to by the king on the 6th of the same month. It is given at length in the SUPPLEMENT to this work.

This constitution vests the legislative power in the king and two representative assemblies. The first of these, which may be called a senate or upper house, comprises 90 members, elected by electoral districts, 30 members of the municipal councils of large towns, with princes of the blood, heads of noble houses, and members named for life by the king; but with the proviso that the entire number of the latter classes shall not exceed that (120) of the first two classes.

The other, or lower chamber, corresponding to our H. of C., consists of 350 members, who are chosen by electors in electoral districts. The electors in these districts are themselves chosen by universal suffrage, that is, by the votes of all the Prussians paying taxes (which they all do) 24 years of age. But to modify the effect of

the principle, the primitive electors are divided into three classes, determined by the amount of the taxes they pay; and these 3 classes of primitive electors, though their numbers be widely different, choose each a third part of the electors who directly elect the representatives. In consequence of this contrivance, the influence of the higher class of voters, or of those who pay the greatest amount of taxes, is not overborne by the mere numerical ascendancy of the other classes, and the chances are that the representative body will be rendered more conservative than it otherwise would have been. It is doubtful, however, whether this arrangement will be permanent.

Members of the first chamber must be 40, and those of the second 30 years of age; but a property qualification is not required in either. The chambers are to be annually convoked in the month of November, the duration of the first being limited to six, and that of the second to three years. The freedom of the press is made a fundamental article; and the maintenance of the old, and the growth of a new aristocracy are prevented by the abolition of existing entails, and their prohibition for the future.

It would be idle to attempt to foretell what may be the fate of this novel constitution. We cannot, however, help regretting that the king should have rushed headlong from one extreme to another, and have attempted to establish his government on the delusive basis of universal suffrage. This concession does not appear to have been dictated by any overwhelming necessity; and it appears to have been no sooner made than repented of; and hence the clumsy plan of indirect election by classified electors. Had a reasonable property qualification been adopted, the probability is, that the electors, and consequently, also, their representatives, would have been influenced to a considerable degree by conservative feelings and principles. But an assembly chosen by universal suffrage, even with all the guards that can be adopted, can hardly fail of being actuated by all those sudden and dangerous impulses by which the public mind is so apt to be determined; and there is nothing in the first or upper chamber that appears adequate to counteract, or even materially affect, the resolutions of the lower chamber. The former is also, in fact, a semi-representative body, and can impart to the Prussian constitution but little of that solidity and security which a more aristocratical and independent body might have given to it. Hence the probability would seem to be, that the new system will not work harmoniously, and that the king and the chambers will, sooner or later, come into collision;—a result which will most probably lead either to a republic or a despotism.

But, apart from these considerations, the destruction of the aristocracy and the rapid subdivision of the land, consequent on the law of equal succession, will, we apprehend, be as injurious to the freedom of the people as to their economical condition. Neither a throne surrounded by liberal institutions like what exists in England, nor a republican system like that of the U. States, can be established on the basis of a population characterised by an equality of condition, especially when that condition is one rather of poverty than of well-being. Such a population can act only by sudden impulses, and in masses, and can, in fact, be governed only by the sword. We entirely agree with Mr. Laing in thinking that liberty and equality cannot continue to co-exist. (*Notes of a Traveller, Second*

Series, p. 102. Liberty, property, and aristocracy may be combined into an enduring system. But liberty and equality of station, or of fortune, is a delusive combination that never fails to be consolidated into a despotism.

A president, with powers similar to those of a French *préfet*, and a salary of 6,000 rix-dollars (900*l.*), is placed at the head of each of the nine provs. into which the kingdom is divided. Each prov. has also a military commandant, a superior court of justice, a prov. director of taxes, a prov. consistory, all appointed by the king. The last is divided into three sections, — one having the superintendence of schools, another of ecclesiastical affairs, and another of the public health. The provs. are subdivided into regencies or counties, and these again into *kreise*, or circles (*arrondissements*), and the latter into *gemeinden*, or *para*. (communes). Each regency has a president and an administrative board or council; and the farther subdivisions have also their local authorities. The municipal organisation of the towns is more complicated than that of the communes. The principal functionaries are all elective; but the elections must be confirmed by the king or the authorities.

The system of law principally in force in the E. states of the Prussian monarchy is embodied in the well-digested code entitled *Landrecht für die Preussischen Staaten*, which received the royal sanction in 1791, and became law in 1794; but it is occasionally modified by custom; and Polish, Swedish, and German laws are still in force in certain parts of the monarchy. The Rhenish provinces follow, with some exceptions, the rules laid down in the *Code Napoleon*. The primary proceedings in judicial matters take place before local courts established in the circles and towns; thence they may be carried before the provincial courts (*oberlandes gerichte*); and in the last resort before the supreme tribunals at Berlin. The judges are independent; and justice is purely and cheaply administered. Juries are employed in the Rhenish provinces, but not in the other parts of the monarchy. Tribunals of arbitration have also been established in the provinces of Brandenburg, Pomerania, Prussia, Silesia, and Saxony, similar to those established in Denmark (which see), and with the same beneficial results. In 1836, of 13,831 cases brought before these tribunals, in the above provinces (excepting Prussia, from which there are no returns), 11,835 were settled, and only 1,996 sent to the higher courts. In no other country, perhaps, is patronage of so little consequence, and merit so sure to lead to distinction and advancement. Candidates for public employment go through a course of education appropriate to the functions they are desirous to fill; and before being appointed, have to submit to a severe examination as to their knowledge, conduct and fitness for the office. "*En Prusse*," says M. Cousin, "*tous les fonctionnaires sont salariés; et comme ils n'arrivent à aucune fonction qu'après des examens sévères, tous sont éclairés; et comme de plus ils sont pris dans toutes les classes, ils portent dans l'exercice de leurs emplois l'esprit général du pays, en même tems qu'ils y contractent l'habitude du gouvernement.*"

The king of Prussia is, next to the emperor of Austria, the most important member of the Germanic Confederation. His contingent to the army of the Confederation is 79,484 men.

Religion. — The royal family belongs to the reformed or Protestant religion; but all denominations of Christians enjoy the same privileges, and are equally eligible to places of trust or emolument. In 1846, the pop. consisted of 9,835,563 Protestants, 6,046,292 Catholics, 214,867

Jews, and 14,531 Mennonites. The Protestants predominate very decidedly in Brandenburg, Pomerania, Saxony, and Ducal Prussia; while the Catholics predominate in the Rhine province and Westphalia, in the regency of Oppeln, in Silesia, and in Posen. When Silesia was acquired by Prussia, the mass of the pop. were Catholics; but at present the Protestants predominate in the regencies of Breslau and Liegnitz, particularly the last.

The Protestant church is governed by *consistories*, or boards appointed by government, one for each province. There are also synods in most circles and provinces, but no general synod has yet been held. The constitution of the Catholic church differs in different provinces. In the Rhenish provinces it is fixed by the concordat entered into between the French government and Pope Pius VII. But in every part of the monarchy, the crown has wisely reserved to itself a control over the election of bishops and priests. In the entire kingdom, there were, in 1837, 5,740 ordained Protestant clergymen, and 140 assistant do.; there were, at the same time, 2,510 Catholic priests, and 2,033 vicars, chaplains, &c.; so that the proportion of Catholic clergymen rather exceeds that of Protestants.

The incomes of the clergy are very different. The higher Catholic clergy are paid by the state, the archbishop of Breslau receiving 1,700*l.* a year, and the other bishops about 1,135*l.* The incomes of the parochial clergy, of both sects, mostly arise from peculiar endowments. Generally government does not guarantee the stipend either of Protestant or Catholic clergymen; but in many parts the clergy enjoy a public provision from the state. This is peculiarly the case in the Rhenish provinces, in virtue of the concordat already alluded to. Proselytism, or the attempting to induce a person to change his religion, whether by force or by persuasion, is prohibited by law; and all controversial sermons, or peculiar displays of religious zeal, would certainly attract the notice, and incur the displeasure of the authorities. If we except the Rhine province and Westphalia, the pop. of which are bigoted Catholics, perhaps there is in no country less of religious acrimony and contention than in Prussia. For further details as to the religious state of Prussia, see the Parl. Paper drawn up by Mr. Lewis from the official returns furnished by the Prussian government.

Education. — Prussia can boast of possessing a more perfectly organised and complete system of national education than has ever existed in any country. Frederick the Great has the merit of having introduced the system into Silesia, after he had wrested it from Austria; and such of our readers as are curious about these matters, will find in "*Adam's Letters on Silesia*," a very full and interesting account of the plans of Frederick in relation to this important subject, of the obstacles he had to encounter in carrying them into effect, and of their result. From Silesia the system has been gradually extended to the other provinces, and is now in full vigour in every part of the monarchy. Attendance at school is *enforced by law*. Every child, whether male or female, rich or poor, must attend a public school from the age of five years complete, till such time as the clergyman of the par. affirms that the child has acquired all the education prescribed by law for an individual in its station: generally speaking, the school time extends from 6 to 14 years complete. Should a child not attend, its parents or guardians must satisfy the public authorities that it is receiving an appropriate education at home or in a private seminary. The school fees are exceedingly moderate; and the children of such poor persons as are unable to pay them, are instructed gratuitously at the public expense. According to the census of 1843, the pop. of the monarchy, ex. Neuschâtel, was 15,447,440. It is calculated that of this number, 2,992,124 were between the ages of 7 and 14, complete; and it appears from the official returns, that of this number 2,328,146 were actually at school, or were otherwise receiving sufficient instruction. It must not, however, be supposed that the 663,978 (2,992,124—2,328,146) apparent excess of children not at school are not instructed. The 2,992,124 includes, as already stated, all the children between 6 and 14 years complete; but the school education of a good many children is completed by the time they complete their 12th or 13th year; and owing to the delicate state of their health, and other circumstances, a good many do not go to school till they have attained their 7th or 8th year. And to these have to be added the children from 7 to 14 years at the primary superior schools, the superior schools for burghesses, gymnasia, lyceums, &c. Allowing for these circumstances, we believe it may be safely affirmed of Prussia, with the exception of a few districts in Posen, that every child born within her limits is educated! In so far, too, as we are able to judge, Prussian education is of a superior quality, though it involves, we believe, too much of sameness, and of military régime. The late king of Prussia deserves high praise for the zeal, perseverance, and discretion he displayed

in maturing this system. Nothing has been omitted that could render it perfect. In the schools for the instruction of the masters, the examinations to which they are subjected, and the supervision exercised over every part, the utmost anxiety is evinced to render it as perfect as possible.

No particular religious creed is allowed to be taught in any school; but on particular days, set apart for the purpose, the children are instructed by the clergymen of the different sects to which they belong. Their religious instruction is not, therefore, neglected; while the intermixture of the different sects from their earliest years, in a perfect footing of equality, removes all asperities and religious animosities. All matters relative to the public schools are managed in each province by a public board appointed for that purpose; and the expense is defrayed by government. (For further information as to the Prussian schools, see the work of Joseph Kay, Esq., in *the Social Condition of the People of England and of Europe*, vol. ii. *passim*; Cousin, *Sur l'Instruction Publique en Prusse*, &c.)

Exclusive of the gymnasiums and superior schools, Prussia has six universities, those of Berlin, Breslau, Bonn, Halle, Königsberg, and Greifswald; and the two semi-universities of Münster and Braunsberg. These are placed directly under the control of the minister of public instruction; and much pains has been taken to render them efficient and useful. The number of professors and subordinate teachers in the universities is very great; and we should incline to think that they have been endlessly multiplied. The university of Berlin is best attended, and next to it those of Breslau and Bonn. In 1837 there were, at the different universities, 1,196 students of Protestant theology, 459 do. of R. C. theology, 5 do. law, 895 do. medicine, and 906 do. philosophy, making in all 4,431 pupils. At present (1850) the total number of pupils is about 5,000.

Military Force.—The situation of Prussia, surrounded by powerful states, and with a disjointed territory, requires for her security a large military force. As the revenue of the country is comparatively limited, it became indispensable to endeavour to organise an army so that it might embrace the maximum of force with the minimum of expense. The Prussian government seems to have pretty satisfactorily solved this important and difficult problem. The obligation of military service is universal; every man (no substitutes or replacements being accepted of) is obliged to enter the army of the line, or the *landwehr* (provincial army), between the ages of 20 and 32, as a private, and to serve in one or the other for three years. At the end of this period he may enter the army of the line for a limited period as a volunteer, of which description of recruits it chiefly consists, or return home to prosecute some civil employment, his service in the army having secured for him various privileges. But the individuals whose period of service in the army of the line, or the *landwehr*, has been completed, continue bound, on returning home, to serve in the 2nd ban of the *landwehr* till they be 39 years of age. They are seldom, however, called on to be exercised, and then only for limited periods. The *landsturm*, or *levy en masse*, consists of all the men not in the army or the *landwehr* up to the age of 50, and of young men between 17 and 20. This force is only called out in case of invasion. The army of the line amounts at present (1850) to about 122,000, and the 1st ban of the *landwehr* to about 98,000. We borrow from the Budget of 1849-50, the following details in regard to the number and cost of the army.

Infantry.—For 5 regiments of guards, 1 battalion guard rifles, 1 ditto of light infantry, 7 battalions of line rifles, 40 regiments of the line, 7 reserve battalions (half invalids), 27 punishment companies or sections; in all, 17 battalions of guards (ex. *landwehr*), 124 line battalions, giving a total of 87,078 men (on the peace establishment), and costing 5,490,868 rix-dollars.

Cavalry.—6 regiments of guards, 32 line (each of four squadrons), in all 38 regiments (ex. *landwehr*), giving 23,345 sabres and lances, and costing 1,930,512 rix-dollars.

Artillery.—1 guard, and 8 line brigades, 5 reserve fortresses companies, and 1 division of projectile artificers (each brigade consisting of 8 field batteries of 8 guns each), in all, 5,945 men, costing 1,310,040 rix-dollars.

Pioneers (Engineers, Sappers, Miners.)—1 guard, 8 line divisions, 2 reserve companies—2,632 men, costing 109,232 rix-dollars.

Invalids.—The invalid company, and 104 sections of veterans—2,632 men, 153,030 rix-dollars; gendarmerie or mounted rifles, 61 men; army gendarmes, or privates, 152, cost 26,693 rix-dollars.

Thus resumed:—

Thus resumed:—

Description of Troops.	No. of Officers and Men.	Annual Pay.
Infantry, guards and line	87,078	R.D. 5,490,868 being 63-06 or 9 9 2 per man.
Cavalry	23,345	1,930,512 — 82-69 — 12 8 0 —
Artillery	5,945	1,310,040 — 220-36 — 33 1 0 —
Engineers	2,632	109,232 — 41-65 — 6 4 10 —
Invalids	2,632	153,030 — 58-14 — 3 14 5 —
Gendarmerie, land and marine	225	27,573 — 166-99 — 26 1 0 —
	121,819	9,051,245 74-11 — 11 2 3 —

Of these 5,444 are officers, 1,427 non-commissioned staff, the remaining 114,978 privates and non-commissioned officers.

During the time of exercise of the *landwehr*, 98,940, including 2,956 officers, and 236 medical officers of arms, receive pay, and cost 733,036 rix-dollars. So the estimate for the peace establishment gives a total expenditure for the year of 9,764,281, exc. a small sum for money, which brings the total to 9,821,216 rix-dollars for the pay of the whole force. The expense of clothing the above number is set down at 1,427,371 rix-dollars. The *landwehr* of the 2nd ban, consisting of men of 32 to 39 years of age, comprises about 350,000 men, is called out in case of war, or other grave circumstance. The regular army and 1st ban of the *landwehr*, amounting to about 220,000 men, are ready to act immediately against an enemy. There are numerous institutions, at Berlin and elsewhere, for military education.

The greatest pains are taken to have the officers instructed, and equal to their duties. Their appointments are good. The condition of the common soldier has also been vastly improved. He is seldom subjected to corporal punishment; and his pay and rations have been nearly doubled since 1805. Their allowances, considering the cheapness of provisions in Prussia, place the Prussian soldiers on a level, in point of comfort, with those of England or of any other country. Nothing, in fact, is omitted that seems calculated to benefit the army, and to keep up the martial spirit of the people. The system imposes, no doubt, excessive privations on the public. But when established there was a general conviction that it was indispensable; and its uniformity, and the impartiality of the laws, prevent it from being felt as a peculiar burden by any particular class. The *landwehr*, however, is useful only as a means of resisting foreign invasion. It wants in the field the efficiency of regular troops, and the interruption given to industry when the 2nd ban is called out, makes it far more expensive than it seems to be; while it is apt to

diffuse a military aggressive spirit among the population. But, whatever be its demerits, it is, at all events, clear that it has completely nationalised the army; which must be always actuated by the sentiments and feelings that prevail among the mass of the people from which it is taken, and to which it is constantly being returned. When, therefore, it is said that Prussia is a "military monarchy," it is necessary to bear in mind that the army is not composed of mercenary troops, but of citizens serving for a limited period, and that it has very little analogy indeed to most other European armies. (For further and ample information as to the Prussian army, see the excellent Essay of the Marquis Caraman, *Sur l'Organisation Militaire de la Prusse*, *passim*.)

Prussia has no ships of war.

Revenue and Expenditure.—The following is the budget of the revenue and expenditure of the Prussian monarchy for 1849 compared with 1848. [See next page.]

It should, however, be observed, that the above statement represents only the nett amount of revenue after the expenses of collection are deducted. These are estimated at from 3 to 4 per cent. on the produce of the direct taxes, and at from 10 to 12 per cent. on the produce of those that are indirect. It will also be observed, that in the account of expenditure nothing is set down for the civil list, or for the support of the monarch and his court: a sum of 2,500,000 dolls. is, however, especially appropriated for this purpose.

The tax on classes is a kind of poll-tax imposed on the inhabitants of the country and towns, according to the amount of their property, and the population of the towns. The tax on industry or trades consists of the sums charged for patents or licences for leave to carry on trades, &c.

National Debt.—Frederick the Great effected all his extraordinary achievements without contracting any debt, and left at his death a large sum in the coffers of the state. Though his successors were not so economical, still, at the breaking out of the war with France, Prussia

* We suspect there must be some error in this item.

was free from debt. In the course of that contest she was compelled to borrow pretty large sums, which, however, have been considerably reduced since the peace. The public debt of Prussia amounted, in 1850, to 187,160,272 rix-dollars, the interest, sinking-fund, &c., payable thereon being 7,491,073 rix-dollars.

Provision for the Poor.—The question as to the provision for the poor has only become of importance since the abolition of vassalage in 1810. Previously to that epoch they were provided for by their lords. At present poor persons, or those unable to provide for themselves, have a legal claim to support. But it is rarely necessary to resort to compulsory proceedings to enforce this claim, the necessities being generally provided for by voluntary subscriptions. There are workhouses in most large towns. That of Berlin had, in 1838, an average pop. of from 850 to 900 persons; which cost at an average 50 rix-dollars a year each.

Food, Dress, Diversions, and Habits of the Bulk of the People.—The food, dress, diversions, and habits of the people are very different in different parts. In general, rye is the ordinary bread-corn. About half a century since the consumption was estimated at from 5 to 6 scheffel per head, but now it is not more than 3 scheffel; the defect being made up by the increased consumption of potatoes. In many districts, indeed, potatoes are now almost the only vegetable food. Besides rye-bread and potatoes, the people use barley, buck-wheat, and milk. In the Rhenish provs., wheat is more extensively used than in the other provs. The wheat cultivated in Prussia Proper and Posen is rather for sale than for inland consumption. Beans and peas are extensively used in most parts of the monarchy. Coffee, mixed with chicory, is extensively used; and on Sundays it is used by all classes; tea is but little used. The consumption of sugar has rapidly increased; and now amounts, at an average, to about 4 lbs. per individual, notwithstanding the substitution of honey for sugar in very extensive districts. The consumption of butchers' meat is considerable, principally in towns. It is estimated over the whole monarchy at from 36 to 37 lbs. a year to each individual. (Dieterici, *Statistische Übersicht*, s. 234.) But in the towns it may be from 40 to 50 lbs., and in the country, perhaps, not more than from 20 to 30 lbs. In Berlin the consumption of butchers' meat exceeds 100 lbs. per individual; and this, in all cases, is exclusive of poultry, fish, and game. Game, indeed, is only used by the richer families; but fish is an ordinary food of the peasantry in many districts. Poultry, especially geese, are largely used by the common people in Pomerania. There is also no want of butter for the peasantry, but the consumption of cheese is greater.

We have already seen that the consumption of spirits is quite immense; it is less, however, in the Rhenish provs., where wine is extensively used, than in other parts of the monarchy. Beer, also, is an ordinary beverage, and the consumption is very great. The consumption of to-

bacco is estimated at 8½ lbs. per individual. The common people (males) use, in winter, a woollen great coat, and in summer, a linen coat. Women now begin to be pretty extensive consumers of cotton stuffs; it is still, however, customary for the young female peasants to prepare stocks of linen in anticipation of their marriage. Wooden shoes are worn, but are not so frequent as in France or Ireland; and in bad weather, almost every body is well shod with leather boots and shoes: but in fine weather, the common people often go barefoot. Silks are only used by the wealthier classes.

It is usual for the peasants to go to church regularly on the Sunday forenoon; and it is customary for them to spend the evening of the day in diversions of some sort or other, frequently in the ale-house, and in Silesia in dancing-parties. Most little towns have shooting-places; and the meetings of the landwehr for exercise is looked forward to with much satisfaction. (*Compiled from Official Documents and Private Information.*)

PRUSSIA (PROPER), an extensive and important prov. of the Prussian dominions, divided into the provinces of East or Ducal Prussia, and W. Prussia, having N. the Baltic, E. and S. Russia, Poland, and the prov. of Posen, and W. Brandenburg and Pomerania. Area, 24,974 sq. m. Pop. in 1846, 2,499,423, of whom 1,791,542 were Protestants, 664,053 Catholics, and the rest Jews and Memnonites. It is divided into four regencies, and 57 circles. Principal towns, Königsberg, Dantzic, Elbing, Tilsit, Marienwerder, &c. It consists principally of an immense plain, traversed by the Vistula, Pregel, Passarge, and other rivers, and interspersed with numerous lakes and immense forests. Soil various, but generally fertile, particularly the delta of the Vistula and the country watered by the Niemen. Principal products, wheat and other sorts of corn, timber, hemp, and flax, provisions, wool, ashes, &c. Rye is more cultivated than any other sort of grain; wheat is also largely cultivated, but more for exportation than for internal consumption, rye being the ordinary bread corn. Oats, barley, and peas are also raised; and latterly potatoes have been extensively cultivated. Farming implements defective and ill constructed: the harrows are made of wood, without any iron, even for teeth. With the exception of the crown estates, which are let on lease, but little land is rented. In the circles of Dantzic, Elbing, and Marienwerder, good land fetches, when let, from about 4s. 6d. to 5s. an acre, the tenant bearing all taxes. But in other districts the rent of the cultivated land does not exceed from 1s. 3d. to 2s. 6d. an acre. The wages of farm labour vary in summer from 4d. to 8d., and in winter from 3d. to 5d., without food; but with a cottage free, or at a low rent, a garden, and pasture for a cow. In harvest the wages are a good deal higher. The peasantry live in wooden or clay cottages, with but few luxuries, principally on potatoes, rye bread, and milk, rarely tasting animal food, but drinking great quantities of spirits and beer. Linen, from flax of their own growth, and wool

open to their villages, furnish their clothing. Domestic animals are numerous, and generally poor, except the horse. Wool and turf are almost everywhere abundant, and are the principal articles of trade. Amber is found along the sea-shore, but other mineral resources are quite unimportant. There are many distilleries and breweries, but, with the exception of Posen, this is the last manufacturing province in Prussia.

PRIOR is a government of European Russia, chiefly between the 53rd and 55th degs. N. lat. and the 23rd and 25th E. long. having N. Pleskburg and Novgorod, of each of which goes it formerly made a part; E. Tver and Smolensk; S. Warsaw and W. Livonia. Area estimated at 71,134 sq. m. Pop., in 1865, 775,000. The surface is nearly flat, with a slope to the N., the direction taken by most of the rivers. None of these are of considerable size, but the soil is, notwithstanding, well watered. At the N. W. extremity is the lake of Pskov, surrounded by a chain with that of Plesk. Marshes are numerous. The atmosphere is usually damp, though, on the whole, the climate is far from unhealthy. Soil thin, and not very fertile, but more rich in green than is required for horse consumption. A good deal of hemp and flax is raised. The forests are extensive, and abound with game. Cattle are not of great importance, and have been less valued than in most provinces. Manufactures have increased during the present century, but they are still of no great consequence. Pskov is divided into 2 districts, civil towns, Pskov, the cap., Tveropol and Velikie-Louki. Its pop. consists mainly of Russians, with some Lithuanians and Finns. Public education is little extended.

PRIOR or Pleskovo, a town of European Russia, cap. of the above gov. on the Volga, 100 m. S. W. Pleskburg. Pop., above 2,000. It is mostly built of wood, and has two great cathedrals belonging to the archbishop and the monastery, a number of churches, two convents, and a high school. Its only manufactures are of leather; and it has a considerable trade in the export of the produce of the country. A large annual fair is held here, Feb., at which large quantities of cotton, silk, and woolen fabrics, leather, books, jewellery, &c., are sold. *Schneider, La Russa.*

PUEBLA (LA), a city of Mexico, cap. of the state of a new name on the summit of a hill, 70 m. S. E. S. E. Oaxaca, and 15 m. W. by S. Vera Cruz, lat. 19° 0' 14" N., long. 98° 5' 20" W. Pop., 20,000 (*Howe*). It is irregularly and uniformly built. The streets, which, though not very wide, are straight, and intersect each other at right angles, are paved with large diamond-shaped stones, with broad and well kept footpaths on each side. The houses, of stone, are generally two stories high, with flat roofs, having usually a court in the centre surrounded with open galleries and a main of fine water conveyed thither by earthen pipes. They have iron balconies toward the street, and their roofs are tiled with highly glazed tiles, or else gaudily painted. The apartments are spacious, owing to the wide, they are mostly paved with volcanic, carpets not being in use, and their walls are covered with paintings in fresco. The family of the proprietor usually resides in the upper story, the ground-floor being occupied with shops, warehouses, or offices, the second story by carriages.

"This would seem to be a perfect model of a city, when such a vast number of people had no fewer than 10 cathedrals, 9 monasteries, 13 convents, and 15 colleges. Many of the churches that they were the most complete he had ever seen. Those of Milan, Genoa, and so on are built in better taste, but in the expensive manner of construction, the quantity and value of the materials of the altar, and the richness of the vestments, are far surpassed by the churches of Puebla and Mexico. The cathedral, which forms one side of the principal square, has nothing remarkable in its exterior, its interior is very rich. The high altar, which, however, is too large for the building, is particularly splendid, and of the other churches are handsome, and like the cathedral, abound in gold and silver ornaments, lamps, statues, &c. The bishop's palace has a library 1 in length, which has a tolerable collection of Latin and French books.

Many of the inhabitants are wealthy, and have handsome residences drawn by moat, but, like Mexico, the city is full of beggars, a consequence of the want of industry, concentrated partly and particularly by the mildness of the climate, but partly, also, by the distribution of lands at the conquest. It was formerly famous for manufactures of coarse woollens, cottons, glass, stoneware, soap, &c.; but most of these have declined the decrease of the trade formerly carried on with Mexico, Callao, and the other ports on the Pacific. Manufactures of glass and earthenware, however, up to the present, and the soap made here is sent to other parts of Mexico.

Puebla was founded by the Spaniards. The state of it is the cap. comprises the town of Puebla, 25. 13.

PUNJAB (THE), (country of the Five Rivers), or LAHORE, a British territory of N. W. Hindustan, between the 30th and 32nd degs. N., and the 70th and 75th degs. E. long., comprising the country between the Indus on the N. W., the Himalaya mountains on the N. E., and the Sutledge on the S. It is of a triangular shape, its apex being at the S. W. extremity. It has on its N. W. frontier the Catholic territories, N. E. Tibet and Ladakh, and S. W. Hindustan. It derives its name from its being watered by the 5 great arms of the Indus, viz., the Jhelum, or Beas (an. *Hydaspes*), the Chenab (an. *Acemara*), the Ravi (an. *Hydras*), and the Sutledge (an. *Hyndra*), with its tributary, the Beas (an. *Hydaspes*). Area estimated at 125,000 sq. m. Pop. probably 4,300,000, chiefly Sikhs, Jatts, Rajpoots, Hindoos of low caste, and Mussulmans.

Nearly the whole country is flat. It is in many parts fertile, especially along the banks of the larger rivers, but it also comprises some wide, sandy, and barren tracts, especially between the Indus and Hydaspes. Cultivation generally increases and improves as we proceed eastward. Of the 4 divisions of the Punjab R. of the Hydaspes, the two nearest to that river are principally depastured by herds of oxen and cattle, and that next to the E. is the best cultivated. Sir A. Burnes says, "there is, perhaps, no inland country which possesses greater facilities for commerce than the Punjab, and there are few better supplied with the products of the mineral, vegetable, and animal kingdoms. These relieve it from any great dependence on external resources. The wheat and barley of the plains are exported within the country; and such is the number of horses, that grain, bajra, and other grains raised in a dry soil, are imported. Rice is abundantly produced under the mountains, but it is not a diet which suits the palate of the people. The cane thrives luxuriantly, and sugar is manufactured for exportation. The smeltiness of the milk is remarkable, but it is used to produce the most delicious fluid, and is preferred to the thicker cases of India. Indigo is raised E. of Lahore, and exported to the Mohammedan countries westward. A valuable oil is extracted from the *drupa*, or saminum plant, and used both for the lamp and culinary purposes. Esculent vegetables, such as turnips, carrots, &c., are produced everywhere; and most of the vines and fruit-trees common to Europe may be seen in the mountains. The climate is not very favourable to the cotton shrub, it is produced to the 'dead' between the Sutledge and Beas rivers, but it is also imported from the dry country E. of the former river. The mineral resources of the Punjab

have been very imperfectly explored. A range of hills, extending from the Indus to the Hydaspes, formed entirely of rock-salt, furnishes an inexhaustible supply, and, being a close monopoly, contributes to enrich the ruler. It is in general use throughout the country, and most extensively exported, till it meets the salt of the Sambre lake in Rajpootana and the Company's territories. There is another deposit of salt on the verge of the mountains towards Mundi, but of an inferior description. In the same vicinity, it is said, some mines of coal have been discovered; and there are also extensive mines of iron. The salt range, and the other high lands, yield alum and sulphur; and nitre is gathered in large quantities from the plains." (*Bokhara, &c.*, lii. 316-322.) The climate in the N., though hot in summer, is as cold in winter as that of France and central Europe, and is never sufficiently warm to mature the most valuable products of Hindostan. Rice is grown in the valleys, but in limited quantities, the usual food of the pop. being wheat or peas, made into a thick soup; and according to Sir C. Trevelyan (*Parl. Rep. on India*, 1840), the Punjab does not produce sufficient sugar for its own consumption, but imports it from British India. Mr. Elphinstone, who travelled both in the N. and S. parts of this country, states that not one third part of the surface seen by him was under tillage; and there can be no doubt of the correctness of his statement, that, except near the rivers, no part of the Punjab will bear a comparison for productiveness with Hindostan. (*Elphinstone's Caubul*, i. 109.)

The plains, which are diagonally intersected by so many rivers, might be successfully irrigated by canals; as is proved by the existence of some, and the remains of many others, the work of the Mogul emperors. The country abounds in cattle and horses, though the former be small and ill-conditioned, and no attention be paid to the breed of either. The salt mines, which were opened at a very early date, are one of the most productive sources of revenue. Burnes states that they yield about 800,000 maunds a year. The salt was sold at 2 rupees the maund, or at a third part of the price of that of Bengal; but the profit to the government amounted notwithstanding to 1,100 per cent. (*Burnes*.) The remainder of the public revenue, which amounted to about 2½ crores rup., was principally derived from exorbitant taxes on land and agricultural stock. Moorcroft mentions a peculiar method of assessing the land tax, adopted, in his time, between the Beas and Sutledje, by a collector who had been chief financial minister to Runjeet Singh. "A given quantity of earth was put into a fine muslin sieve, and washed with water until all the mould was carried through, and nothing but the sand left, and, according to its proportion to the whole, a deduction was made from the assessment. Four rupees for 2 begas was the fixed rate for the rich soil; 3 if it contained one fourth of sand; 2 if it had a half; and 1 where the sand was three fourths the quantity. The general character of the soil of the Punjab, composed chiefly of mould and sand, renders this mode of appreciating its assessment more correct than might be supposed, and it was, at any rate, preferable to the old plan of assessing the land according to the estimated out-turn of the standing crops." (*Moorcroft's Trav. in the Himalayas*, vol. i. p. 121.)

As respects the commerce of the Punjab, the staple commodities are the shawls of Cashmere, which reach India and Europe wholly through this channel. The annual revenue from the shawl manufacture, exclusive of every expense, is rated at 18 lacs of rupees, though, from frauds of all kinds, this sum greatly exceeds the amount that actually reaches the treasury. It is a curious fact, that the silkworm is unknown in the Punjab, though the silks of the immediately adjacent state of Mooltan have a high reputation in India. The natives in the E. of the Punjab excel in the manufacture of cotton, and their looms furnish white cloth at from ½ to 1 rupee a yard, which, though inferior in appearance to that of British manufacture, is stronger and more durable. There is a considerable demand for foreign copper, brass, tin, and lead; all kinds of British hardware and woollens are much prized. There is a considerable importation of European articles; and British chintzes have wholly superseded those of Mooltan.

The Punjab is interesting to the classical scholar, from its being the theatre of Alexander the Great's

Indian victories. Mr. Elphinstone supposes the scene of the defeat of Porus to have been at Jelalpoor, on the Hydaspes, while, according to Burnes, it was most probably at Jelum, about 25 m. higher up the river. Burnes imagines he has discovered on the opposite sides of the Jhylum, about lat. 32° 40' N., long. 73° 40' E., the sites of Nicœa (victory town), built by Alexander at the point where he crossed the Hydaspes, and of Bucephalia, built in commemoration of his favourite horse, Bucephalus, which expired in this region. (*Mitford*, viii. 200.) Burnes joins Major Wilsford in identifying the neighbourhood of the celebrated tope of Manikyala, between the Indus and the Hydaspes, with the site of the anc. Taxila. There are, however, very few Greek remains in the Punjab; and the statements of the historians of Alexander, as to the places where the great events in his Indian expedition occurred, are far too indistinct to allow of any certain conclusions being deduced from them. The Sikhs, now the ruling race in this quarter, originated as a Hindoo sect, about the middle of the 15th century, and remained in a turbulent feudal condition till early in the present century. About that period, Runjeet Singh, having subdued the other Sikh chieftains, established a despotism; which, though far behind the governments of Europe, was yet far in advance of most native governments in the East. He maintained an army of about 25,000 regular infantry, drilled as Europeans, 5,000 regular cavalry and artillery, and, perhaps, 50,000 irregular horsemen. His government was vigorous, without being either cruel or unnecessarily severe. After his death, which occurred in 1839, and the assassination of his son and successor, the country became a prey to all sorts of anarchy. At length, in 1845, the several chiefs so far composed their differences, as to invade the British territories with a powerful and well-appointed army: but being defeated in a series of engagements, concluding with the battle of Sohraon, a treaty was concluded with them in 1846. They appear, however, to have entered into this treaty rather to gain time than with any other object, and, in 1848, they again attacked the British. On this, as on the former occasion, they displayed the greatest bravery, and the contest with them was most severe; but being completely defeated and dispersed in the battle of Goojerat, the country was finally occupied by our troops, and incorporated with our territories, in 1849.

PUTIWL, or POUTIVL, a town of European Russia, gov. Koursk, cap. distr., on the Seim, a tributary of the Dniepr, 100 m. W.S.W. Koursk. Pop., 9,000.

PUTNEY, a par. and village of England, co. Surrey, on the Thames, 4 m. W.S.W. Hyde Park corner. Area of par. 2,880 acres; pop. of do., in 1841, 4,864. The village, which is well built, and has numerous houses occupied by parties who mostly prosecute their business in London, is connected with Fulham, on the opposite bank of the river, by a wooden bridge erected in 1729. The par. church, of an ancient date, was in great part rebuilt in the reign of Henry VII.; here, also, is a place of worship for dissenters, an endowed school for the sons of watermen, and 2 national schools. Putney is a station on the railway from Waterloo bridge to Richmond; and it has a constant intercourse with the city by means of steamers.

A college was lately established, in a fine situation on the banks of the Thames, a little to the E. of the village, for the education of civil engineers. The instruction in it is good; it is well attended; and it is well and economically conducted.

The greatest of English historians, the illustrious author of the "Decline and Fall of the Roman Empire," first saw the light at Putney, on the 27th April, 1737. (*Lyson's Environs*, i. 296., and *Private Information*.)

PUY (LE) (an *Reverio* and *Pelloni*), a town of France, dep. Haute-Loire, of which it is the cap., on the Borne, here crossed by a bridge of 8 arches, 36 m. S.W. St. Etienne. Pop., in 1846, 13,522. It stands on a steep acclivity, and has, when seen from a distance, a picturesque appearance; but, in reality, it is ill-built, and the streets, which are narrow, dirty, and ill-paved with smooth pieces of lava, are frequently impracticable for vehicles of any kind, and even dangerous for foot-passengers. Lately, however, the commerce of Le Puy has revived, and the town has been a good deal improved. The cathedral, in a very conspicuous situation, a Gothic structure of the 10th century, has a richly ornamented altar, on which is a statue of the Virgin brought by Louis IX. (St. Louis) from Egypt, and presented by him to the city in 1254, on his return from his unfortunate expedition to that country. Adjacent to the town is a very singular needle-shaped rock, about 300 ft. in height, on the summit of which another church is erected. Among the other public buildings are the prefecture, a handsome new edifice; a public library, with 5,000 vols.; town-hall, bishop's palace, seminary, college, hall of the tribunal of commerce, 2 hospitals, barracks, and theatre. Le Puy has a tribunal of original jurisdiction, a chamber of manufactures, a commercial college, normal school, a

city of agriculture, science, and arts, gratuitous courses of geometry and mechanics, applied to the arts, and a small museum of antiquities and paintings. It is celebrated for its manufacture of white and black lace. Lode is very ancient, but its origin is uncertain. It suffered considerably in the wars of the League; and till lately its trade and prosperity were much depressed.

PUY-DE-DOMÉ, a central dep. of France, formerly part of Auvergne, between lat. $45^{\circ} 17'$ and $46^{\circ} 15'$ N., d long. $2^{\circ} 20'$ and 4° E.; having N. Allier, E. Loire, S. Haute-Loire and Cantal, and W. Corrèze and Creuse. ea. 797,238 hectares. Pop., in 1846, 601,494. This dep. almost wholly covered with mountains of volcanic nature, the highest of which, the Pic de-Sancy, is 23 ft. in height: the Puy-de-Dôme, whence the dep. as its name, has an elevation of 4,842 ft.* Principal rivers, Allier, Dore, Sioule, and Dordogne, most of which have a N. direction; the Allier intersects the dep. at its centre, and its valley, the Limagne of Auvergne, is exceedingly fertile. In general, however, the soil is sandy, stony, and otherwise indifferent; and agriculture, owing to the poverty and ignorance of the peasantry, is in a more backward state than in most other parts of France. Great numbers of the inhabitants annually go in search of field labour into the adjacent provinces. 634,866,320 hectares of the surface were said to be in 90,121 h. in pastures, 23,153 in vineyards, 82,389 in cereals, and 192,112 in heaths and wastes. Rye, oats, and wheat, are the principal grains cultivated. The annual produce of wine is estimated at from 400,000 to 600,000 casks; it is mostly of inferior quality, cannot be conveyed place to place without the risk of being spoiled, and, really speaking, is good for little, unless it be mixed with other wines. (Jullien, 173.) The annual produce of oil is estimated at 900,000 kilogr. Chestnuts, timber, &c., walnut oil, and cheese, are among the principal sources of its wealth. Puy de Dôme yields lead, antimony, coal, granite, &c. Its manufactures, which are confined to the arrond. of Thiers and Ambert, consist in the former principally of cutlery and hardware, leather, wax lights, &c.; and in the latter, of iron, linen, and cotton goods, lace, and paper. The dep. is divided into 6 arrondis.; chief towns, Clermont-Ferrand, Ambert, Issoire, Riom, and Thiers.

RENEES, a lofty chain of mountains in S.W. France, separating Spain from France, and which, taken in its largest extent, may be regarded as stretching from Creux, in Spain, on the Mediterranean, near the mouth of France, W. to the coast of Galicia, a distance of 680 m. It is more usual, however, to confine the name to that portion of the chain which separates Spain from France:—

"Pyrene colles nimborum varicibus atrox
Divinitus Cœli latus præcipit Iberum,
Atque sacras cunctas inagis clivibus terribis."

thus restricted, the chain terminates on the W. enterrains, between lat. $42^{\circ} 10'$ and $43^{\circ} 20'$ N., and 20° E. and 2° W., its length being about 270 m., its breadth about 24 m., and the area about 1,100 sq. m. This great range may be considered as consisting of two main branches, both having the same direction, though not in a direct line, the point of division being formed by d'Arnan, near the head waters of the Garonne, of which the W. part is more southerly than that to the E. The escarpment is on the side of Spain; the slope towards France being much more gradual, owing to the level of the level districts about the Adour and Garonne. It may be remarked, also, that the French valleys descend the crest of the chain by easy steps, more or less, while the opposite side presents a continued series of rugged chasms, abrupt precipices, and huge naked rock. The chain at each extremity descends towards the sea; but the fall on the E. is much steeper than on the W.; the elevation only 60 m. Mediterranean being 6,000 ft., whereas, on the W. side, this altitude is not found nearer than 70 m. to the coast. The following table gives the elevation of the principal summits of the Pyrenees (top next col.)

Summits marked with an asterisk, which comprise the highest points of the chain, are on its S. face. As found, as in the Alps, on some of the higher peaks; but these masses of permanent ice are much fewer, the point of perpetual congelation being of 10,000 ft., or about 2,000 ft. higher than in the Alps, owing chiefly to the vicinity of the sea.

Peaks of the Pyrenees are numerous, and of various heights; for, whereas the depressions of

remarked by the way, that it was here, on the 18th of August, that the decisive experiments recommended by Laplace, on the weight of the air, and its influence on the height of the barometer, were carried into effect, by conveying to the summit of the mountain. The result was precisely that anticipated, the mercury falling as the point of observation was raised. (See *Metéorologie*, *Histoire de la Science*; and *Biographie Comtemporaine*, art. *Pompe*.)

the Carthaginians and Romans. Indeed, there are the remains of 300 or 400 deserted mines in different parts of the Pyrenees, some of which are said to be very rich. The veins of marble are numerous and valuable, one of them, a white marble, being equal, in purity and closeness of texture, to that of Carrara.

The flora of the Pyrenees comprises the rhododendra, the alpine rose, and a large variety of plants common to high elevations; the principal forest trees being the box, fir, pine, and, in lower situations, the deciduous oak. The fauna comprises the *ixard*, a species of chamois, the wolf, and the bear; with a variety of birds, many of which are migratory.

The Pyrenees give rise to numerous rivers. Those on the N. side comprise the Adour and its tributaries, the Pau, Oleron, Saison, Nive, &c.; the Garonne, with the Gers, Arriège, and others of its affluents, all sending their waters into the Bay of Biscay; and the Aude, the Tet, and the Tech, falling into the Mediterranean. The rivers descending from the S. slope are mostly tributaries of the Ebro, the principal being the Arragon, Gallego, Cinca, and Segre, all of which have numerous branches; the other rivers of this slope are the Ter and the Lobregat, the latter flowing into the sea close to Barcelona.

With respect to the scenery of the Pyrenees, as compared with that of the Alps, Mr. Inglis observes, that each has its peculiar charms, but that scenes of savage sublimity are more frequently met with in Switzerland than in the Pyrenees; the N. lat. of the former, as well as the greater size of its rivers and lakes, adding to its features of wild grandeur. The Pyrenees, however, appear to exceed the Alps in elevation, owing to the much lower level of the valleys, as compared with those of Switzerland, some of which are nearly 4,000 ft. high, while those of S.W. France scarcely exceed 2,000 ft. The presence of oaks, also, in the forests, clothing the sides of the mountains, gives a beauty to the Pyrenees which is wholly absent on the fir-covered steep of the Alps. But, however worthy of the traveller's notice, these valleys will probably never become the frequent resort of the tourist, because access to them is extremely difficult, and the accommodation for travellers worse than indifferent; while Switzerland, accessible in several directions by good roads, is visited not only on its own account, but because it is the high road to Italy. (*Inglis's Switz., France, and Pyrenees*, p. 242-5.)

The mountaineers of the Pyrenees are shepherds, and small proprietors both of land and cattle; but owing to the deficiency of nutritious vegetation, their condition as graziers is far inferior to that of their brothers of the Alps. They are patient and industrious, though seldom raised above want; besides which, they are in every thing, but especially in food and clothing, more simple and primitive than the Alpine mountaineers, than whom, however, they are unquestionably handsomer and more vigorous. Their food usually consists of rye or barley bread and paste, made from Indian corn, with, occasionally, salted kid's flesh and pork. Mr. Inglis speaks favourably of their character for kindness and generosity; adding, also, that "crime of every description is rare in the Pyrenees, theft very unfrequent, and murder altogether unknown." (P. 249.) On these mountains is found the extraordinary race of people, called *Cagots*, distinguished by their sallow and unhealthy countenances, stupid expression, want of vigour, relaxed appearance, imperfect articulation, disposition to goitres, and inferior share of mental capacity. They live in the most retired valleys, secluded from and studiously avoiding intercourse with the rest of the inhab., by whom they are looked upon as a degraded race: and though they are not persecuted, enslaved, and debarred the privileges of religion as formerly, they are "still a separate family, still outcasts; a people having evidently no kindred with those who live around them, but the remnant of a different and more ancient family." The origin of this curious race is hidden in obscurity; but M. Ramond and others conceive them to be the miserable remains of the Germanic conquerors of the Spanish peninsula.

The Pyrenees, which seem to have been known to the Greeks under the name of Πυρην, are connected with many important historical events. Hannibal crossed them on his way to Italy, at the beginning of the second Punic war, most probably by the pass of Pertus, near the E. end of the chain. Julius Cæsar also traversed them with his army, when marching into Spain against Pompey. Charlemagne carried his victorious arms over these mountains, and added Spain to the empire of the Franks. Edward the Black Prince led his army over one of the western passes, when fighting in defence of Peter the Cruel against Henry of Trastamare; and these mountains have obtained a more recent celebrity from having been the scene of several obstinate struggles between the French and English at the close of the Peninsular war, the result of which set in a striking point of view the great military talents of the Duke of Wellington. (*Les Pyrénées, par Chausseque*, p. 9-43.; *Palasson, Histoire Nat. des Pyrénées*, 2 vols. passim; *Encycl.*

Metrop., art. *Pyrenees*, by the Rev. G. C. Renouard; *Milano, Inglis*, &c.

PYRENEES (BASSES), a frontier dep. of France, reg. S.W., formerly comprised in Gascony, Bearn, and Navarre; between lat. 42° 47' and 43° 35' N., long. 0° and 1° 48' W., having N. Landes, E. Hautes-Pyrenees, S. and W. Spain, and N.W. the Bay of Biscay, on which it has a coast-line of about 25 m. Area, 749,490 hect. Pop., in 1846, 457,832. The Pyrenees bound this dep. on the S.; their highest point in this part of the range, the Pic du Midi, being 9,546 ft. in height. Their ramifications cover the greater part of the dep., which is traversed by the rivers Gave de Pau, Oleron, Bidouze, Niève, &c., tributaries of the Adour, and flowing N.W. Small lakes, mineral springs, &c., are very numerous. Except on the mountains, the climate is temperate and healthy; the soil in the lower parts of the country is very fertile, while the mountain sides are covered with fine pastures and forests, which maintain great numbers of cattle and hogs. In 1834, 156,223 hectares of the surface was said to be arable, 66,264 in artificial meadows, 23,175 in vineyards, 130,172 in woods, and 240,732 occupied with natural pastures, heaths, wastes, &c. (*French Official Tables*.) "Between Betharam and Pau, the country is beautiful. We are traversing the rich vales of Bearn, every inch of land is cultivated, and the road is a constant succession of villages and houses. The principal products of this country are fruit, wine, and Indian corn, all of which grow in great perfection. It is in this district that the prunes so much prized in England are grown and prepared; and every description of fruit that is produced in the lower parts of Bearn is excellent of its kind. Here, too, we find the vine, not as it is found in the other parts of France, an insignificant shrub, covering the acclivities, and possessing not much greater beauty than a potato-field; but trained from tree to tree, as in some parts of Italy and in the Tyrol. This district, excepting the valleys of the Pyrenees, is certainly the most beautiful part of France." (*Inglis's Switzerland*, &c., p. 308.) Agriculture is, however, in a very backward state: by what would seem to be a singular contradiction, the sides of the hills are cultivated, while the plains, which, it may be presumed, would be much more productive, are left waste or in pasture; and the corn is insufficient for the home supply. Maize and wheat are the grains principally cultivated; flax and hemp are, also, raised in large quantities. The produce of wine is estimated at about 300,000 hectolitres a year, of which about $\frac{1}{3}$ part is consumed by the inhab.; some growths, particularly those of Jurançon, near Pau, are of a superior quality. In 1830, there were estimated to be nearly 117,000 head of cattle in the dep., and 464,800 sheep, the produce of wool being supposed to amount to about 1,000,000 kilogr. The breed of horses has been greatly improved by the stud at Pau: a great many mules are bred for export into Spain. The hogs furnish the hams so well known under the name of *jambons de Bayonne*. In 1835, of 94,893 properties subject to the *Contribution foncière*, 47,058 were assessed at less than 5 fr., while 14 only were assessed at 1,000 fr. and upwards. Copper, iron, sulphur, cobalt, slate, marble, and granite, are among the mineral products; and mining industry is carried on upon a pretty extensive scale. The manufactures comprise woollen and linen stuffs and yarn, printed handkerchiefs (called *mouchoirs de Bearn*), leather, hardware, earthenware, paper, chocolate, brandy, &c.; and the dep. furnishes supplies of planks, with cordage, &c., for the dock-yard at Bayonne. The value of the cattle, wine, hams, salted geese, &c., exported to foreign countries, especially contraband to Spain, is estimated at 4,000,000 fr. a year, and that of the exports to other parts of France at about 3,000,000 fr. Basses-Pyrenees is divided into 5 arronds.; chief towns, Pau, the cap., Bayonne, Mauleon, Oleron, and Orthez. It sends 5 mems. to the Ch. of Dep. Registered electors in 1838-9, 1,106. Total public revenue in 1831-2, 7,858,744. (*Hugo*, art. *Basses-Pyrénées*; *Dict. Géog.*; *French Official Tables*; *Inglis*.)

PYRENEES (HAUTES), a frontier dep. of France, reg. S.W., formerly included in Gascony, between lat. 42° 42' and 43° 35' N., and long. 30' W. and 35' E., having N. Gers, E. Haute Garonne, W. Basses-Pyrenees, and S. Spain, the ridge of the Pyrenees forming the line of demarcation between the two kingdoms. Area, 452,799 hectares. Pop., in 1846, 251,285. Within the limits of this dep. are some of the most remarkable places of resort and objects of curiosity in the Pyrenees, as the baths of Bagnères, Bagnères, and Cauterets, the valley of Gavarnie, *Breche de Roland*, &c. By far the greater part of the surface is covered with ramifications of the Pyrenees, among which the Gave de Pau, Gers, Adour, &c., take their rise. Small lakes are very numerous in the mountains. In 1834, of the surface of the dep. 94,839 hectares were estimated to be arable, 44,376 in meadows, 15,202 in vineyards, 84,611 in woods, and 173,579 in heaths, wastes, &c. There is a larger proportion of good soil in this than in the neighbouring dep. of the *Basses-Pyrénées*.

PYRENEES (ORIENTALES).

QUEBEC.

ebanics' Institute was established in 1830; and it has numerous benevolent associations. The city public library, though not very extensive, is said to be well selected, and to contain a great variety of standard works. The garrison, also, has a good library. Several newspapers are published in the city.

Though not a manufacturing town, Quebec has various distilleries, breweries, with tobacco, soap, and candle works; and numbers of fine ships have been launched from its yards. It has two or three banks, and a savings' bank. The markets are well stocked with most sorts of produce; but good fish is rather scarce and dear.

The climate, though on the whole good and healthy, is in extremes. In summer the heat is equal to that of Naples, while the cold of winter is not inferior to that of Moscow. This inequality occasions a corresponding difference in the modes of life during the different seasons of the year. In winter travelling is carried on by means of sledges and carriages, in the same way as in Russia. The first view of Quebec in sailing up the St. Lawrence is striking in the extreme; and there is a magnificent prospect from the citadel on Cape Diamond.

The majority of the pop. being of French extraction, the French language, which is still spoken in some of the best circles with great propriety, and the R. Catholic religion, predominate. Society is here more polished and refined than in any other town of British America; and the higher provincial gentry of French descent are distinguished by the courteousness and urbanity of their manner. But, in consequence, perhaps, of the seductive example of the mimic court established amongst them, all classes are much given to show, and generally indulge in expenses beyond their means. Hence Quebec is very expensive; and owing to the jealousies that exist, and the violence of provincial politics, society is split into different parties. Great attention is, also, paid to etiquette; and those admitted to the governor-general's parties rarely associate with those who do not enjoy that honour.

Vessels of the very largest burden arrive at Quebec. Its harbour or basin, between the city and the island of New Orleans, is of great extent, having in general about 26 fathoms water, the tide rising from 16 to 18 ft. at neaps, and from 25 to 30 ft. at springs. Ships lie alongside the wharfs along the St. Lawrence. There are extensive flats between the lower town and the St. Charles, where wet docks might be easily constructed.

The trade of the city is very extensive. It engrosses, with Montreal, almost the entire trade of the prov. with the mother country, the W. Indies, &c. Great numbers of emigrants leave this country for Canada; but the larger number subsequently re-emigrate to the U. States. (See art. CANADA, l. 518.) It has a regular intercourse, by means of steamers, with Montreal, and other ports higher up the St. Lawrence, and with Halifax, and other ports on the Atlantic. Still, however, it must not be forgotten that in so far as the United Kingdom is concerned, the trade with Canada and Quebec is, in a considerable degree, forced and factitious, and is not a source of profit, but the reverse. It is in fact, as has been already shown (l. 522.), mainly a consequence of the high discriminating duties laid in our ports on timber from the N. of Europe. But for this preposterous arrangement, the trade between Great Britain and Quebec would be extremely unimportant. Of the total value of the imports from Canada, timber makes two thirds, the only other articles of any importance being furs and ashes. The corn and flour exported from Quebec is not the growth of the prov., but of the U. States. The principal articles of import into Canada consist of corn, cottons, woollens, silk, and other manufactured goods; glass ware, spirits and wines, iron and hardware, sugar and tea, &c. The total value of the imports into Canada (of which, however, by far the largest portion goes to Montreal) in 1848 amounted to 2,107,164. currency (24s. 4d. cur. = 20s. ster.). Declared value of British produce and manufactures exported to Canada in 1849, 1,324,931.

It is material, however, to bear in mind, that little more than half the imports are paid for by the exports; they are, in fact, principally paid for by the treasury at home, and are to be regarded as the means sent out by England to pay the troops and meet the other heavy expenses she has to incur in the preservation of this most unprofitable colony.

Account of the Number of Vessels and their Tonnage, which arrived at the Port of Quebec, Inc. those bound for Montreal, from Sea, and the Number of Passengers that came by them, from 1846 to 1850, Inc.

Years.	Vessels.	Tons.	Passengers.
1846 - - -	1,448	573,104	32,753
1847 - - -	1,173	474,545	97,583
1848 - - -	1,044	426,968	28,261
1849 - - -	1,064	431,063	38,494
1850 - - -	1,479	434,291	97,292

Of the vessels that arrived at Quebec in 1850, 96

were foreign, viz., 45 Norwegian, 24 American (U.S.), 19 Prussian, 3 Russian, 2 Portuguese, 1 Hanoverian, 1 Swedish, and 1 Dutch.

During the year, 1,054 vessels cleared at the port of Quebec; they were almost exclusively employed in the export of timber, and were nearly all of large tonnage.

Quebec, as every one knows, was taken from the French in 1759. A British army, under General Wolfe, having effected a landing near the city, attacked and defeated the French army under Montcalm, on the heights of Abraham, to the W. of the town. Wolfe fell in the moment of victory; and Montcalm, who was also mortally wounded in the action, expired soon after. The French, panic-struck by the loss of the battle and the death of their commander-in-chief, surrendered the city before even a single battery had been opened against it. A monument was erected, under the patronage of Lord Dalhousie, in the gardens of the château, inscribed to the "Immortal memory of Wolfe and Montcalm."

QUEDLINBURG, a town of Prussian Saxony, reg. Magdeburg, circ. Aschersleben, on the Bode, a tributary of the Saale, 7 m. S.S.E. Halberstadt, and 33 m. S.W. Magdeburg. Pop., in 1846, 13,410. It is well built, and is surrounded by turreted walls, pierced by 4 gates. On an eminence immediately above the town is an old castle, now falling into decay, but which has a good library, and is in part converted into a school. It was formerly the residence of the abbesses of Quedlinburg, who were princesses of the empire, and had a seat on the Rhenish bench of bishops. Many of these abbesses are buried in the *Stiftskirche*, or church of the ancient abbey; in which are also the tombs of Henry the Fowler, his empress, the beautiful countess Königsmark, mother of Marshal Saxe, &c. Quedlinburg has several hospitals, public schools, and various charities; with manufactures of woollen stuffs, distilleries, sugar refineries, &c. The rearing of cattle and hogs employs many of the inhabs. Klopstock, author of the "Messiah," was a native of Quedlinburg, having been born here on the 2d of July, 1724: since his death a monument has been erected to his memory in the Brühl garden, near the town. Quedlinburg was formerly a free imperial city, and has been frequently the residence of the German emperors and the seat of ecclesiastical councils. (*Berghaus, Allg. Länder, &c.*, iv. 644.; *Murray's Handbook for N. Germany.*)

QUEENBOROUGH, a bor., sea-port, and par. of England, co. Kent, Lake Scray, on the E. coast of the

Ramus, one of the earliest and ablest opponents of the scholastic system of philosophy, and the Marquis Condorcet, were natives of the vicinity of St. Quentin, though not, as is frequently stated, of the town itself.

QUERETARO, a city of Mexico, cap. of the state of its own name, in a rich and fertile valley, 110 m. N.E. Mexico, and 60 m. E.S.E. Guanajuato; lat. $20^{\circ} 36' 39''$ N., long. $100^{\circ} 10' 15''$ W. Pop. at least 40,000. (*Ward*.) It is a well-built city, with three large squares, many handsome public and private edifices, and the usual excess of convents and churches. The Franciscan monastery is spacious, and surrounded with extensive gardens; and the convent of Santa Clara is an immense building, inhabited by 250 females, including many young ladies sent thither for their education. The streets have side pavements, laid with flags of porphyry: the city is well supplied with water, brought to it by an aqueduct about 10 m. in length, carried across the valley upon 60 arches.

It is divided into 5 parishes; 4 in the body of the town, and 1 in the suburbs, separated from the rest by a little stream. "We were much struck with the busy look of Queretaro, which has quite the air of a manufacturing town. More than half the houses contain shops, and the pop. is engaged either in small trades or in the wool manufactories, which are still very numerous. These are divided into two classes, *obrages* and *trapiches*. The first comprises the establishments that employ from 10 to 30 looms; the last those in which only one or two are in activity. In both coarse cloths, of different patterns and sizes, are manufactured; part of which are retailed upon the spot in the great Plaza, where a market is held every evening by torchlight, and part sent to the capital or other great towns of the confederation. The demand for these manufactures has decreased very much since the ports were opened to European imports; indeed, the woollen trade is now principally kept up by a government contract for supplying the army with clothing. The price paid for scarlet, green, and yellow cloths of the very coarsest texture, varies from 24 reals (12s.) to 15 reals (7s. 6d.) per vara: and there is no doubt that they might be obtained of a better quality at a much lower price from abroad. The wool is brought principally from the northern states, San Luis de Potosi, and Zacatecas; its price fluctuates from 16 to 24 reals the arroba of 25 lbs., including carriage; but the wool most esteemed is the produce of the state itself. It acquires its value, not from any superiority in the breed of the Queretaro sheep, but from the circumstance of the flocks being so much smaller than those of the north that they can be better attended to, fed in richer pastures, and kept more clear from thorns, which deteriorate the fleece. This wool sells for 34 dollars (or 30 reals) the arroba." (*Ward's Mexico*, ii. 183, 184.) The manufactures of this city are conducted on the same nefarious system that prevails elsewhere in Mexico (*see* this vol., p. 316.), of inveigling the Indians into debt by the voluntary advance of money, and then shutting them up in the factories, under prison discipline, with criminals of all kinds, till they have liquidated the debt by their labour, a circumstance which every pains is taken to prevent, and which rarely occurs. (*Poinsett's Notes on Mexico*, p. 186, &c.)

QUIMPER-CORENTIN, a town and river-port of France, dep. Finisterre, of which it is the cap., at the junction of the Elr with the Odet, about 11 m. above where the latter falls into the bay of Benaudet, 115 m. W. by S. Rennes; lat. $47^{\circ} 58' 29''$ N., long. $4^{\circ} 6' 15''$ W. Pop., in 1846, 9,339. It stands on the declivity of a hill, and is divided into the old and new town. The former, surrounded by walls flanked with towers, is ill built; but in the new town there are some good streets and houses. The cathedral, a handsome Gothic edifice of the 15th century, and other churches; the military hospital; the college, a large structure formerly belonging to the Jesuits; the theatre, and some public baths, are the principal public buildings. The river is navigable as far as the town for vessels of 200 tons burden, those of greater size anchoring opposite its embouchure, in the Bay of Benaudet. It has manufactures of earthenware, and building docks; its inhabs., also, engage in the pilchard fishery, and carry on a pretty brisk trade in provisions. Quimper is a bishop's see, and derived its present name from its first bishop, in the 5th century; previously to which, it was called *Cortospitum*. It was sacked by Charles of Blois in 1345.

Among the distinguished men, of whom Quimper has to boast, may be mentioned Hardouin, the commentator of Pliny, celebrated alike for his learning and his paradoxes; and Freron, the most voluminous, but, at the same time, the least valuable of the French critics of last century. (*Hugo*, art. *Finisterre*; *Dich. Géog.*, &c.)

QUITO, a celebrated city of S. America, cap. of the repub. of Ecuador (*Ecuador*), in a ravine on the E. side of Pichincha (a volcanic mountain, which, at no very distant period, was in a state of activity), above 9,500 ft. above the sea, 160 m. N.N.E. Guayaquil, and 460 m. S.W. Bo-

gota. Lat. $0^{\circ} 13' 27''$ S., long. $78^{\circ} 10' 15''$ W. Pop., variously estimated at from 40,000 to 70,000. Quito is, on the whole, one of the best built cities in the New World. It has four broad, straight, and well-paved streets, and three large and some smaller squares, in which are the principal public buildings, and the best private residences. The streets which run N. and S. are pretty level, but those which cross them ascend the skirts of the Pichincha on the one hand, and descend on the other towards a small river, over which is a small bridge; and from this unevenness of the ground some of them are so steep as to be impracticable for carriages, besides being, for the most part, narrow, crooked, unpaved, and almost impassable after heavy rains. So numerous, also, are the crevices in the mountain, that, in the suburbs particularly, several of the houses have been raised on arches. The houses, which are large and convenient, are mostly built of unburnt bricks, cemented with a species of mortar, used by the anc. Peruvians, which soon becomes extremely hard. On account of earthquakes, they are seldom more than one story in height, exclusive of the ground-floor, or *rez-de-chaussée*. They are flat-roofed, and have usually a balcony towards the street. Generally speaking, they are indifferently furnished, and deficient in cleanliness. The city has an abundant supply of indifferent water, obtained from several streams, which flow through it in conduits. The principal square has, in its centre, a fine brass fountain; and on its sides are the cathedral, the bishop's palace, the town-hall, and the palace of the president. The last is a gloomy-looking building, with a terrace in front, ascended by two flights of steps. In it are the halls of the *audiencia*, treasury, and archives, the president's apartments, with the offices of the public secretaries, and the gaol. The cathedral, a plain building, with a steeple at one corner, is much less handsome than several of the other churches. Quito has numerous convents. The ex-Jesuits' college has a beautiful front, with Corinthian columns, finely sculptured by native artists. The interior of this edifice is very rich, and when visited by Stevenson it had a library, said to comprise 30,000 vols., including several rare works. A part of the edifice has been converted into halls for the university, and another part into barracks. Ulloa speaks in high terms of the Franciscan convent, which, he says, from its size, fine proportions, and beauty, might be classed with the best edifices in Europe. Previously to the Revolution, the churches and convents were richly furnished with silver ornaments, plate, paintings, &c.; but a part of this wealth has, we believe, been since turned to more useful purposes. It has a workhouse and orphan asylum on a large scale, and said to be well conducted, an hospital, &c.

Quito ranks pretty high, at least among Spanish American cities, as a place of education. It had two universities before the time of Charles III., but they were then united into one. Besides this university, which still exists, there are several colleges under the guidance of the different religious orders. Ulloa states, that young men of distinction usually studied philosophy, theology, and jurisprudence. "They succeed pretty well," he adds, "in the exact sciences, but are extremely ignorant in all that respects politics, history, and those philosophical studies that contribute most to expand and enlarge the mind." There can be no doubt that this is a perfectly accurate statement; but we apprehend the students of Salamanca in Old Spain were, at the epoch of Ulloa's visit to Quito, but little more advanced than those belonging to the latter. It were absurd to suppose that colleges conducted by priests, under an arbitrary government, should supply any sound instruction, either in politics or philosophy.

The city was made a bishop's see in 1545, and is the residence of the President, and the seat of all the superior courts and offices of the republic.

Coarse cottons, and woollen cloths, baises, flannels, ponchos, stockings, &c., are made in Quito, which is also highly celebrated for its confectionary; but its chief exports consist of the corn, and other agricultural products of the province. These, with some of its manufactures, are sent by way of Guayaquil to Central America, in exchange for indigo, iron, and steel; and to Peru in return for brandy, wine, and oil, and for gold, silver, and other metals, Ecuador not being very rich in mineral wealth. The foreign imports comprise all kinds of European manufactured goods, with iron, steel, and some other raw materials. "The European manufactures most in demand are English broad cloths, kerseymeres, coloured broad flannels, calicoes, plain and printed dimities, muslins, stockings, velveteens; Irish linens, in imitation of German *plattillas*; all kinds of hardware and cutlery, and foreign silk velvets, satins, &c., as well as English ribbons and silks. As for the Lima market, the articles should be of a good quality, and of the newest fashion; the more this point is attended to, the better the market will be found." (*Stevenson's S. America*, ii. 319.) The markets of Quito are abundantly

(See, &c.)

CONIGI, or **RACONIGI**, a town of the Sarfoss., div. Coni, prov. Saluzzo, cap. mand., near Ira, and 21 m. S. Turin. Pop., in 1838, inc. 0,102. It is walled, and tolerably well built: several good churches; but its chief ornament is a stle and park, belonging to the Prince of Carignano. Among the works of art in the castle are some (if they may be so called), beautifully executed. Silk weaving and spinning are the principal of industry in and round this town. (*Dict.*

OR, an internal co. of England, S. Wales, having cos. of Montgomery and Salop, E. Hereford, &c., from which it is separated by the Wye, and gan. It is of a triangular shape, and comprises rea. With the exception of some low and com-fertile tracts along the borders of Hereford, and in the valley of the Wye, the larger por-r of this co. is wild, mountainous, and dreary. d. in Davies' *Survey of S. Wales*, published in about two *thous* the surface consisted of waste ly moor, but partly also bog! Several divi-one extensive enclosures have, however, been the interim; so that the extent of waste or and, though still very great, has been ma-tinished. At present, the wastes are mostly

and rosegille. Though Ragusa has greatly declined from her former importance, she still has a considerable coasting trade, and in 1838, 236 vessels belonged to the port, 30 of which traded to the Levant and the western ports of the Mediterranean. Ragusa was founded in the 7th century by some fugitives from Epidaurus in Illyria, when that city was destroyed by the Slavi. It continued to be a republic under the successive protection of the Greeks, Venetians, and Turks, till 1806, when it was taken by Napoleon, who erected it into a dukedom, which he conferred on Marshal Marmont. On the fall of the former, Ragusa was given to Austria. (*Berghaus, Allgemeine Länder, &c.*, iv. 960.; *Austria, Nat. Encyc.*, &c.)

RAJAHMUNDY, a distr. of the Madras presid. in British India. (See **CIRCARS, NORTHERN**.)

RAJAHMUNDY, a town of Hindostan, cap. of the above distr., on the Godavery, about 50 m. from its mouth, and 65 m. N.E. Masulipatan. It stretches along the river for some distance, and has an old fort, several mosques, a fine bazaar, &c. It is the seat of the district court, and a station for two companies of sepoy. (*Madras New Almanac, &c.*)

RAJEMAHAL (*The Royal Residence*), a town of British India, presid. Bengal, prov. Bhanguipore, on the Ganges, 65 m. N.W. Moorshedabad. Under Ac-bar, and Sultan Shujah, the brother of Aurungzebe, it

manufactures of tobacco, chicory, carriages, and machinery and instruments of various kinds; but is principally noted for two congresses held in it; the first, in 1714, when a treaty was concluded between Marshal Villars and Prince Eugene; and the second, in 1798-99, which terminated abruptly in the unexplained assassination of two of the French envoys. (*Berghaus; Dict. Géog.*)

RATHKEALE, an inland town of Ireland, prov. Munster, co. Limerick, on the Deel, 17 m. W.S.W. Limerick. Pop., in 1831, 4972. It principally consists of one street, nearly 1 m. in length, which has many good houses and shops. A par. church, a R. Catholic chapel, with an Independent and a Methodist meeting-house, a fever-hospital, dispensary, court-house, and bridewell. Several families of German palatines are settled in the town. General sessions are held four times a year; petty sessions on Thursdays. It is a constabulary station, and has a considerable retail trade. Markets on Thursdays: fairs on 7th Feb., 4th April, 1st and 19th June, 5th Aug., 18th Sept., and 18th Nov. Post-office revenue, in 1830, 376*l.*; in 1836, 580*l.* A branch of the national bank was opened here in 1835.

RATISBON (Germ. *Regensburg*, an. *Castrum Regium*, afterwards *Augusta Tiberii*), a city of S. Germany, cap. of the Upper Palatinate, in Bavaria, on the Danube, across which it communicates with its suburb, Stadt-am-Hof, by a bridge, 1,000 German ft. in length, 64 m. E.N.E. Munich. Lat. of St. Emmeran's Tower 49° 0' 59" N.; long. 12° 5' 43" E. Pop. about 22,000, two-thirds being Rom. Catholics. It is one of the oldest towns in Germany, and has a proportionally antique appearance. Its streets are narrow and irregular; and its houses, though lofty, are altogether old-fashioned and inconvenient. Many have tall battlemented towers, loopholes for musketry, &c.; and among the large residences are several ornamented with heraldic bearings. The cathedral is a fine Gothic edifice, begun in the 13th century, but the greater part appears to have been constructed in the 15th: its interior was formerly crowded with a number of extraneous ornaments; but these have been removed. In it are a few fine works of art, including a *bas relief* on the tomb of the Primate Dalberg, designed by Canova. Two older cathedrals adjoin this edifice; one, now used as a baptistery, is supposed to date from the 10th or 11th century, and the other is of a still earlier date.

Near the cathedral is also a massive square tower, probably a remnant of an ancient Roman fortress. The church of St. Emmeran has some very curious monuments of high antiquity, but it is now half in ruins; and St. Emmeran's Abbey, a large though not a fine building, has been converted into the palace of the prince of Tours and Taxis. The establishment to which the latter belonged was founded long before the time of Charlemagne, by whom it was enlarged; and, at the time of its dissolution, it is said to have been 1,200 years old. The Scotch Benedictine convent, a monastic institution in Ratisbon, the small revenues of which has prevented its secularisation, supports two monks and five young Scotch ecclesiastical students. It has a very curious church, supposed to date from the 10th or 11th century. The town-hall, a gloomy and irregular structure, is interesting as being the seat of the German diets from 1663 to 1806. The apartments formerly occupied by the diet present little that is remarkable; but beneath the edifice are some dungeons, in which are preserved the rack, and other machinery of torture, formerly in use. (*See Murray's Handbook for S. Germany*, p. 66.)

The old bishop's palace, in which the emperor Maximilian II. died, is now a brewery. The ramparts of Ratisbon are no longer of use as a means of defence, but serve as public walks. Within the city is a monument to the great astronomer Kepler, who expired here in 1630. Ratisbon has a royal academy, Rom. Catholic lyceum, Lutheran gymnasium, theological seminary, observatory, public library with 20,000 volumes, school of design, museum of mathematical and philosophical instruments, botanic society, &c. Since it has ceased to be the seat of the German Diet, it has been mostly shorn of its importance; but a good many vessels for the navigation of the Danube are built here; and it has several breweries, distilleries, tanneries, and iron-works. It formerly enjoyed the exclusive right of the navigation of the Danube, upwards to Ulm, and downwards to Vienna. This privilege is extinct, but it still has a large share of the traffic on the river. At Donaustadt, on the Danube, about 6 m. distant, is the *Valkalla*, a fine Doric marble temple, built by the present king of Bavaria, for the reception of statues and busts of the distinguished men of Germany. This edifice, commenced in 1830, was to be completed in the course of 1841.

Ratisbon was the capital of the dukes of Bavaria, till their duchy was overturned by Charlemagne. It was afterwards a free imperial city, governed by a count of the empire. In 1809, some severe fighting took place

before it between a part of the grand French army, under Napoleon, and the Austrians, to the disadvantage of the latter, who were forced to retire towards Bohemia. (*Berghaus, Allg. Länder, &c.*, iv. 135.; *Dict. Géog.*, &c.)

RAVENNA, a city of the Papal States, cap. leg. of the same name, on the Montone, amid extensive but fertile marshes, 43 m. E.S.E. Bologna, 84 m. N.W. Ancona, and 4½ m. from the Adriatic; lat. 44° 25' 16" N., long. 12° 12' 11" E. Pop., about 16,000. It is chiefly deserving of notice for its architectural remains. Having been the cap. of Italy during the last years of the W. empire, and successively the residence of Honorius, Valentinian, Odoacer, Theodoric, and the succeeding Gothic monarchs, it presents many interesting specimens of the architecture of that period, few of which are elsewhere to be found. The empress Placidia, from 423 to 450, and Theodoric, from 492 to 526, embellished it with the best edifices the times were capable of producing; and many of these exist in singularly good preservation. The church of San Vittore is said to date as far back as the early part of the 4th century; but, according to Mr. Woods, what remains of it, even if the date be accurate, is a mere barn, without character. The earliest perfect church is that of Santa Agata Maggiore, completed in the early part of the 5th century, having granite columns, rich marbles, &c., apparently taken from some more ancient edifice. San Giovanni del Sagra was built by Placidia, anno 435; San Francesco apparently about the same date; St. Apollinaris Nuovo, a foundation of Theodoric, and having mosaics of that period; St. Apollinaris, at Chiassi, built by Justinian, on the ruins of an ancient temple of Apollo; and Spirito Santo, also of the 6th century. In all these churches the general plan and style are nearly the same. They consist of three naves divided by columns, supporting arches; the middle nave terminating in a semicircular recess, covered with mosaics. The roof is of timber, and not concealed. No very distinct marks of specific difference are observable in the workmanship, between the structures of the 4th and 6th centuries, except in the ornamental parts: the capitals and mouldings of the later period are much more fanciful. The cathedral of Ravenna was originally founded towards the end of the 4th century; but the present building is modern, and has some frescoes by Guido, bas-reliefs, and rich altars. Near it is the baptistry, an octagonal building, probably of the same date as the ancient cathedral, and almost covered with mosaics, attributed to an archbishop who lived about 430. The baptism of Christ is represented on the dome in mosaic, "and the river-god seems also to be introduced into the composition." The church of San Vitale, another octagonal structure, dates from the first half of the 6th century. Here, also, is a little church built by Placidia, whose tomb it contains, with those of Honorius, Constantius, Valentinian III., &c. Without the city is the mausoleum of Theodoric, constructed by his daughter Amalsunta.

But by far the most interesting of all the structures to be seen at Ravenna is the tomb of Dante, the immortal author of the *Divina Commedia*, who expired here, in exile, on the 14th of Sept., 1321.

"Happier Ravenna! on thy hoary shore,
Fortress of falling empire! honour'd sleeps
The immortal exile." (*Childe Harold*, iv. 59.)

He was buried in the church of the Franciscan monastery, in a handsome tomb erected by his protector Guido da Polenta, restored by Bernardo Bembo in 1483, again restored by Cardinal Corsi in 1692, and replaced by a more magnificent sepulchre in 1780, at the expense of Cardinal Louigi Gonzaga. The Florentines repeatedly demanded the ashes of the mighty dead, but these demands were uniformly met by a flat and firm denial.

The *Porta Asrea*, a triumphal arch at the W. entrance of the city, and a few remains, said to be portions of Theodoric's palace, and having, according to Woods, some similarity to those of the palace of Diocletian, at Spalatro, comprise the principal remaining antiquities. The city has ramparts, which, however, are of little service as means of defence. Some of its squares are neat, and ornamented with statues of popes, &c.; and the streets are mostly wide and regular, but dirty; and the houses are old-fashioned, and gloomy. It has a few silk manufactures, and a large annual fair; but, like Padua, it is very dull, and fitter for study than for active business. A monastery has been appropriated to a public library, containing from 30,000 to 40,000 vols.; and a museum, with a few objects of natural history, antiquities, casts, and paintings. Few of the churches are rich in paintings, but there are some good private galleries. Byron praises Ravenna for its climate, and says, he found much education and liberality of thinking among the higher classes. It is an archbishopric, and the residence of a Papal legate.

Ravenna was originally founded by a colony of Thesalians, most probably on the sea-shore, but in the days of Strabo, it was, owing to the accumulation of mud,

surrounded by marshes. (Lib. v. p. 146) Hence says
Silius Italicus

"*Latæ paludes præcelsæ stagna Ravennæ.*"
(Lib. viii. v. 602.)

Being difficult of approach, and well fortified, its advantages as a stronghold and a naval station were perceived by Augustus, who constructed a new harbour, about three miles from the old town, which he connected with the Po and the
the continent by a causeway
became the principal station
the new and old cities with
mediate buildings. But the
lation of mud and other m
Po and other rivers, that ha
ancient city, in so very loc
struck by Augustus: it is
from the sea, and so early
of the Christian era "the
varied into pleasant orchards; and a lonely grove of
pines covered the ground where the Roman fleet once
rode at anchor!" (Gibbon, v. 208, 8vo. ed.) But this
very circumstance, though it lessened the naval im
portance, increased the strength of the new city, which,
from the beginning of the fifth to the middle of the
eighth century, was considered as the seat of govern
ment, and the capital of Italy. At length the Greek
ex-archate being overthrown, the city and its territory
was given by Pepin to the Holy See in 773. Subse
quently Ravenna successively belonged to its own lords,
the Bolognese, and the Venetians, till 1509, when it
reverted to the Pope. In 1612, the French, under the
Duke de Nemours, gained a signal victory over the
Spaniards, at a short distance from Ravenna; an event
commemorated by an obelisk erected on the field of
battle.

READING, a parl and muni. bor. and market-town
of England, hund. its own name, co. Berks, of which it
the cap., on the Kennett, close to its junction with the
Thames, and on the line of the Great Bath Road and of
the Great Western Railway, 38 m. W. London. Area of
tri. and mun. bor., which are co-extensive, 2,080 acres.
op. in 1841, 18,499. "The town is of considerable size,
and apparent prosperity, the inhabs. having increased
rapidly within the last 15 years. A new high road into
the heart of the town, lately completed, is an important
improvement. There are many excellent houses, and
the main streets are spacious, containing very good
shops, and being well lighted with gas." (Boswell. Rep.)
The town-hall, completed in 1783, is a substantial build
ing, well adapted for municipal purposes. The borough
is small and inconvenient, and the house of coun
cil, though large, is reported to be "deficient in
one important requisite, badly ventilated, insecure,
without punishment cells." (Prison Inspectors' 5th
Rep.) Reading has three par. churches. St. Lawrence
large structure with a fine tower of flint and stone,
in the perpendicular style; the other churches
of a mixed architecture; and St. Mary's is remark
able for a handsome tessellated tower. Two of the livings
are the gift of the lord chancellor, and St. Lawrence
goes to St. John's College, Oxford. There is a cha
pel-ease and a licensed episcopal chapel in the par. of
Mary's, and a district church in that of St. Giles,
where are places of worship for Rom. Catholics, Bap
tists, Independents, Wesleyan Methodists, and the So
ciety of Friends. The town has numerous Sunday
schools, furnishing religious instruction to nearly 2,000
children, and there are several subscription day-schools,
attended by about 800 children. The grammar school,
founded in the reign of Henry VII., and en
dowed with property belonging to the decayed hospital of
St. Lawrence, received great additions from Archbp. Laud,
Thomas White conferred on it two fellowships at
St. John's Coll., Oxford. It enjoyed a high reputation
as a classical seminary, while the Rev. Dr. Valpy was
master, and was then attended by 120 boys, partly
day scholars and partly boarders; since then, however, it
has declined; but it continues to be a respectable
and is improving. The school is open to all
other natives or residents of Reading; but none
attend free. (Char. Comm. 3rd Rep.) A blue-coat
school, founded in 1646, has an endowment producing
an income of £500 a year, and furnishes cloth
ing (corporation); a girl's green-coat school, in St.
Mary's, is supported by subscription. Reading has a
m. opened in 1839, and numerous almshouses
and charities, few towns in England having so
much of property held in trust for charitable
purposes.

A dispensary, eye-infirmary, and savings
bank have been established within the last few years.
The Institution has an excellent library and
reading room, and it has also a subscription news-room,
institute, small theatre, and two weekly
papers published.

The trade of Reading is very considerable, but more of
a general than specific character. The manufacture of
woollens was formerly pretty extensively carried on,
chiefly in a large range of buildings known as the Oracle;
but the business is now wholly abandoned, and the build
ings are occupied by ribbon and silk weavers, of whom
there is a considerable number in and about the town.
Floor-cloth and sail-cloth are also produced, and there
are several large breweries. The trade of the town was
greatly facilitated by the Kennet and Avon Canal and
the Thames Navigation, and it has been still more facil
itated by the opening of the Great Western Railway,
which has here a principal station.

Reading, "which claims to be a bor. by prescription,"
was incorporated by Henry III., and has received many
subsequent charters. Under the Municipal Reform Act,
the bor. is divided into 3 wards, the municipal officers
being a mayor and 6 other aldermen, with 18 councillors.
Corporation revenue in 1848-9, £3,369. Quarter and petty
sessions are held under a recorder; and a county court

extensive inland sea between Africa and Arabia, con
nected with the Indian Ocean by the strait of Bab-el
Mandeb, less than 20 m. across, between lat. 12° 40' and
20° N., and long. 32° and 44° E. Extreme length, 1,420
m.; do. breadth, 350 m.; average breadth, 135 m.; esti
mated area, 185,000 sq. m. It runs in a pretty direct
course from N.N.W. to S.S.E., being divided at its N.
extremity into two arms, the longest and most westerly
of which is the gulph of Suez, at the head of which is the
port of the same name, which see. The other branch,
which runs N.N.E., having a length of 150 m., is called

Retford is a vicarage, value 140*l.* a year; patron, Sir R. Sutton: that of West Retford is a rectory, in the gift of the corporation of East Retford, value 364*l.* a year. (*Ecc. Rev. Rep.*) In the suburb of Moorgate is a new chapel of ease, in the Gothic style: there are in the town places of worship for Baptists, Independents, Wesleyans, &c. The town-hall is a convenient building, surmounted by a cupola, and having beneath a good market-place. There are 2 almshouses, one for old men, the other for women; a free grammar-school, founded by Edward VI., of which the municipal authorities are trustees; a national school, established in 1813, various minor charities, a news-room, and a small theatre. There is no manufactory of any kind in the town, which depends entirely for its support upon the retail trade carried on with the inhabs. of the surrounding agricultural districts. (*Mun. Corp. Rep.*) Salt was formerly extensively carried on, and hat-making and the manufacture of worsted were introduced; but these branches have nearly ceased. The town is not navigable at Retford; but it communicates with the Trent by the Chesterfield Canal, which passes of the town, and is carried over the Idle by an aqueduct. East Retford is governed by 4 aldermen and 12 councillors, and had formerly petty sessions, &c.; but the Municipal Reform Act orders that it shall not have commission of the peace unless upon petition or grant. Previously to this act, its police was reported to be very efficient, and the administration of the corporate and other revenues had been very unsatisfactory. (*Mun. Rep., Append.*) It is said to have been a bor. by prescription: it received many charters from Henry III. and subsequent sovereigns, down to James I. East Retford returned 2 mems. to the H. of C. in the 9th Edward II., continued to enjoy this privilege down to 1836. But having been proved that gross bribery had been practised at the election that then took place, it was proposed by one party to incorporate the adjoining hundred of Retlaw with the bor., and by another to transfer the town to Manchester, Birmingham, or some other of the great towns that were then unrepresented. After a heated discussion, the first-mentioned plan was adopted, so that the parli. bor. of East Retford is now identical with the hundred of Bassettlaw. Registered voters, in 1849-50, 2,644. Markets at East Retford on Wednesdays; fairs, March 23. and Oct. 2., for horses, cattle, and cheese. (*Parli. Reports, &c.*)

RETHEL, a town of France, dep. Ardennes, cap. d. on a steep declivity beside the Aisne, here crossed by a wooden bridge, 24 m. S.W. Mézières. Pop. 5, ex. com., 7,607. It is pretty well laid out, and growing; but the houses are still mostly of wood, and there is no remarkable public building. Rethel was formerly the cap. of a co. of Champagne, and is fortified. It has a court of original jurisdiction, a municipal college, society of agriculture, theatre, hospitals, and two prisons. It is chiefly noted for linen manufactures, which are estimated to employ 100 to 1,800 hands, mostly spinners. As in most manufacturing towns, the workpeople are generally lodged at their homes. The prices of labour are at lower than in Rheims; but provisions, &c., are dear, and, on the whole, the woollen spinners of Rethel are in a better condition than those in that city. It has been considerably augmented by the opening of the canal of Ardennes: besides woollen manufactures, the town has many iron forges, breweries, and &c. (*Hugo, art. Ardennes; Villermé, Tableau des Pop., i. 248-252.*)

RETHEN, a gov. of European Russia. (*See ESTHONIA,*

Eath. Tallin, Russ. Kolyvan), a sea-port town in Europe, cap. of the above gov.; on a small island S. side of the Gulph of Finland, 200 m. W.S.W. of St. Petersburg; lat. 59° 26' 33" N., long. 24° 44' 30" E. Pop. 10,000. The city proper, included within the walls, is small; and though it has many good brick streets, they are narrow and irregular. There are a mosque, a R. Cath., and some Greek churches, a library, and various charitable and educational institutions, the latter including a gymnasium, episcopal seminary, and a school (*penzion*) for nobles. The modern edifice, is appropriated to the provincial government; the municipal officers, who are elected by ballot, reside in the town-hall. The admiralty is the main public building. The suburbs, consisting of wooden houses, cover a large extent along the shore. Revel is much resorted to for bathing place, and has some good warm baths, several clubs or *casinos*, and 3 or 4 public libraries, of which, the property of the city, is said by some to comprise 10,000 vols. This town is one of the best in the Russian fleet, and has a harbour defended by several batteries. This port, which was materially improved in 1820, is deeper than that of Cronstadt, and the difficulty of entrance. The roadstead, between some islands, is well sheltered: the long pier

duration of the frost is the principal drawback on Revel as a naval station, though that is a disadvantage which it shares in common with the other Russian ports in the Baltic. Though not connected with the interior by any navigable river, Revel has a considerable trade. Its principal exports are corn, spirits, hemp, flax, timber, and other Baltic produce; the imports consist of colonial produce, herrings from Holland and Norway, salt, cheese, wine, tobacco, fruits, dye stuffs, cotton yarn, stuffs, and other manufactured goods, &c. A portion of the customs' revenue is enjoyed by the town.

Revel was founded by the Danes in 1218, and afterwards sold by them to the Knights of the Teutonic Order. In 1561 it came into the possession of the Swedes, but was taken from them by the Russians in 1710. Near it is the Katharinenthal Palace, built by Peter the Great; the gardens of which are a favourite public promenade. (*Schnitzler; Possart, &c.*)

REUS, a town of Spain, in Catalonia, 9 m. W. Tarragona, and 54 m. W. by S. Barcelona. Pop., according to Mifano, 24,600. It stands on a plain gently sloping towards the coast, and comprises several streets lined with good houses, with numerous churches, hospitals, barracks, an orphan asylum, theatre, and handsome public fountains. The inhabs. are extensively employed in the manufacture of silk and cotton fabrics, hats, soap, &c.; besides which, there are large dye-houses, bleaching-grounds, tanneries, spirit-distilleries, glass-houses, &c.; in fact, Reus may be regarded as one of the most important manufacturing towns of Catalonia, and the numerous handsome houses in its neighbourhood sufficiently indicate the industry and prosperity of its inhabs. The town is connected by a canal with the port of Salou, whence its products are exported in exchange for rice, flour, cod-fish, anchovies, &c. Its weekly market is one of the largest in Spain, and is frequently attended by upwards of 10,000 persons. The town was founded in the middle of the 12th century; but its present importance is wholly consequent to the establishment of silk and cotton manufactories at the close of the last century. (*Mifano; Laborde, Itinéraire de l'Espagne; Dict. Géog., &c.*)

REUSS, a territory of Central Germany, forming two indep. principalities, between lat. 50° 20' and 51° N., and long. 11° 48' and 13° 15' E., having S. Bavaria, E. Saxony, and N. and W. the territories of Prussia, Cobourg, Gotha, and Weimar, the last dividing it into two unequal portions. Area, 891 sq. m. Pop., in 1846, 110,819. Surface generally hilly: in the N. it is watered by the Elster, in the S. by the Saale. Tillage is less an occupation of the inhabs. than the rearing of cattle and sheep. The most fertile tract adjoins the town of Gera. Woods comparatively extensive, and one of the chief sources of national wealth. Woollen, linen, and cotton fabrics are produced; mining is little followed, and the only metallic works are a few iron-forges. The inhabs. are almost all Lutherans. The territory of the elder branch of Reuss consists of the lordships of Greiz and Burgh, having an area of 144 sq. m., and a pop., in 1838, of 32,100. Greiz is the chief town, and seat of the superior judicial court, whence appeal lies to the tribunal of Jena. The public revenue amounts to about 80,000 dollars a year; the contingent to the army of the confed. being 223 men. The younger branch of Reuss has a territory of 447 sq. m., composed of the lordships of Schleiz, Lobenstein-Ebersdorf, and Gera, with a pop. of 69,700; chief town, and seat of gov., Schleiz. Appeal from the courts of this principality lies also to Jena. Public revenue, about 235,000 dollars; contingent to army, 522 men. Each branch has a separate vote in the full diet of the German Confed., and together with Hohenzollern, Lippe, Liechtenstein, and Waldeck, the 16th place, and a vote in the committee. (*Berghaus, Allg. Länder, &c., iv. 392-394; Almanach de Gotha.*)

REUTLINGEN, a town of Wirtemberg, circ. Schwarzwald (Black Forest), of which it is the cap., on the Neckar, a tributary of the Neckar, 19 m. S. Stuttgart. Pop. in 1838, 11,500. Reutlingen presents a contrast to many other old Imperial cities, having mostly regular streets, and well-built though antiquated houses. It has been fortified, and has several suburbs. One of its churches has a tower said, by Berghaus, to be 320 ft. in height: the town-hall, lyceum, a well-endowed hospital, and orphan asylum, are the other most conspicuous edifices.

It has manufactures of leather, lace, net for women's caps, of the annual value of 100,000 florins; clocks and watches, &c.; with dyeing and bleaching factories, and printing establishments, whence many pirated editions of German works have issued.

Reutlingen was the first town in Swabia which embraced the Reformation. (*Memminger Besch. von Wirtemberg; Berghaus, &c.*)

RHEIMS or REIMS (anc. *Durocortarum*, post. *Remi*), a celebrated city of France, dep. Marne, of which, though not the cap., it is by far the largest town, cap. arrond., in a plain near the Vesle, a tributary of the Aisne, 27 m. N.N.W. Chaions, and 95 m. E. by N.

Parts; lat. $49^{\circ} 10' 41''$ N., long. $4^{\circ} 57' 47''$ E. Pop. in 1866, 48,481. It is surrounded by ramparts fringed with stone, which, being planted with trees, form agreeable public walks; and there are other promenades in the immediate neighbourhood. It is about a league in circuit, and is entered by six gates, one of which, the *Porte Neuve*, a triumphal arch, with handsome doors of open iron-work, was raised in honour of Louis XVI at his coronation. Two principal thoroughfares, which meet in the *Place Royale* divide the city into four unequal portions. It is tolerably well laid out, its streets being wide, straight, and generally clean. It has several good squares, but its houses are small, having mostly only two floors, and are constructed with monotonous uniformity. Water works, beyond the walls, distribute the waters of the Vesle through the town, but, according to Hugo, in insufficient quantity; and there is not one handsome public fountain. It has, however, some remarkable public edifices.

The cathedral, one of the largest and most magnificent in Europe, is that in which the coronation of the French kings has taken place, with few exceptions, from the era of Philip Augustus. It was chiefly constructed between 1212 and 1242. It is 479 ft. in length, 90 ft. in breadth, and 144 ft. in height. It has a noble front, flanked with two square towers, 224 ft. in height. Of the three grand entrances on this side, the central is 24 ft. and those on either side 20 ft. in width; above the former is a beautiful circular window. The whole front is ornamented with nearly 140 statues, and a great number of columns and bas-reliefs, and similar decorations abound in every part of the exterior. In one of the towers is a bell weighing 28,000 lbs. This cathedral has some fine stained glass, tapestry, marble pavement, &c., a very fine organ, the "washing the feet," a *chef d'œuvre* of Fontaine, various curiosities, including the first said to have been used in the baptism of Clovis, and the tomb of Jovinus, a citizen of Rheims, who arrived at the dignity of Roman consul anno 288. The last, an admirable specimen of ancient art, was transferred from the church of St. Nizier, destroyed during the phrensy of the Revolution.

Rheims, which was a place of great consideration under the Romans, had various other antiquities, but they were mostly destroyed or carried off during the period in question. The most remarkable ancient monument now existing is the *Porte de Mars*, one of the city gates; a triple archway, ornamented with eight Corinthian columns, and numerous bas-reliefs, though

distasteful, and enormous, a council des professeurs, chamber of manufactures and arts, a royal college, &c. It has a public library of 34,000 printed vols. and 1,000 MSS., a botanic garden, schools of mutual instruction, a *casse de paille*, savings bank, &c.

Rheims is the centre of the manufacture of woollen stuffs, which extends over nearly the whole d^{pt.} of Marne, and the adjacent d^{pts.} of Aisne and Ardennes. In 1826, these manufactures were estimated to employ 28,000 hands, of whom 12,000 were settled in Rheims. About 2,000 of the latter were women. The principal manufactures at Langres were: weaving, spinning yarn, &c. 1,000 in full; preparing the fabric made. woollen manufactures of Rheims progress in most of its branches. The time of workmen vary, from up to 45 fr. a day, women 30 fr. from 10 to 75 c. But the few in the city, 25 fr. 2 fr. and women 75 c. to 1 fr. work for about 15 hours a day being mostly employed in the factories. In general the work is well paid, but they are as few save money. The value of the wool is not so high as in most manufacturing towns

1826, the proportion of magnitude to total birth amounted to about 1 in 4. (Follmer, *Tallem des Oueds*, t. 216-237.) Rheims also produces soap, candles, bladders, and gingerbread, and has breweries, tanneries, leather-factories, &c. It is a principal depot for the wines of Champagne, large quantities of which are stored up in cellars, similar to those of Epervay, which see. Besides its trade in woollen manufactures and wines, it has a considerable trade in cotton stuffs, flour, and other agricultural products, &c. Under the Romans, *Durocortorum* was the cap. of Belgica II., and was distinguished as a seat of letters and philosophy. It became a bishopric before the irruption of the Franks, and received many privileges from the Merovingian kings. In 1008, Rheims successfully resisted the arms of Edward III. In 1247, a university was founded in it, which lasted till the Revolution, when it was suppressed. In 1814, it was taken by the Russians, who were soon after expelled by Napoleon, with great loss.

Among the great men of whom Rheims has to boast, the most distinguished by far is Calhoun, minister of Finance during the most splendid period of the reign of Louis XIV., born here on the 28th of August, 1610. It has also given birth to the Abbé de la Florie, the historian Velly, &c. (Hugo, *art. Marne*; Follmer, *Tallem des Oueds*; D'Anville, *Nomencl. de la Gaule*, III., &c.)

RHIN (BAS, or LOWER-RHINE), a frontier d^{pt.} of France, in the E. part of the kingdom, which, with Haut-Rhin, formerly constituted the prov. of Alsace, chiefly between the 48th and 50th d^{gs.} of N. lat., and the 7th and 8th E. long., having N. Rhodan, Bavière, and the d^{pt.} of Moselle, W. Meurthe and Vosges, E. Haut Rhin, and E. the Rhine, separating it from the Grand Duchy of Baden. Area, 491,791 hectares. Pop., in 1846, 280,579. The W. part of the d^{pt.} is covered by the Vosges mountains, and their ramifications. The average elevation is from 1,000 to 1,500 ft.; but the Hochfeld rises to 4,400 ft., and the Schenoberg to 2,000 ft. The surface declines towards the E. Principal rivers, the Ill, with its numerous tributaries, the Moder, Sava, Sarre, &c. In 1824, the arable lands were estimated at 160,000 hectares, meadows 24,000 ditto, vineyards 13,120 ditto, orchards 1,704 ditto, and woods 117,744 ditto. The marshes in the E., and the stony tracts of the W., are unsuitable for agriculture, and though the middle of the d^{pt.} be fertile and well cultivated, the produce of cere is not sufficient for home consumption. More potatoes are grown than in any of the neighbouring d^{pts.}; nearly 4,746,000 hectolitres having been produced in 1825. A good deal of tobacco is raised, and bought by the government. The annual produce of wine may be estimated at about 400,000 hectolitres. It is of a medium quality, but, speaking generally, is inferior to that of the Haut Rhin. About a half of the produce is consumed in the d^{pt.}, the rest being sent, partly to other d^{pts.} and partly to Baden, &c. Hay, wood, hemp, onions, and other vegetables, are articles of extensive cultivation. The plough is usually drawn by horses. Horned cattle are pretty numerous, but sheep are scarce. Poultry are extensively reared near Strasbourg; particularly geese, the fivers of which serve to make the *pâté de foie gras*, for which that city is so celebrated. In 1826, of 221,246 proprietors entitled to the *contrib. foncière*, 141,943 were assessed at less than 5 fr., and only 80 at 1,000 fr. and upwards. Iron mines are wrought; lead, antimony, cobalt, coal, and bitumen are met with; and salt is made from springs, in the N. and W. The d^{pt.} has manufactures of cotton yarn, muslins, vealins, and linen cloths, leather, and lery, carriages, glass wares, &c. There are many iron-forges, and fire-arms are manufactured at Mulding and Kilmersbach. Strasbourg is the seat of an extensive general commerce and transit trade. Bas-Rhin is divided into four arrondis., chief towns, Strasbourg the cap., with 22,146 hab., Savonnes, Schiltstadt, and Wissembourg. Total public revenue (1844), 12,911,200 francs. The majority of the population is Protestant.

RHIN (HAUT, or UPPER RHINE), a frontier d^{pt.} of France, in the E. part of the kingdom, formerly comprised in the prov. of Alsace; between lat. $47^{\circ} 32'$ and $49^{\circ} 18'$ N., and long. $6^{\circ} 46'$ and $10^{\circ} 30'$ E., having N. Bas-Rhin, W. Vosges and Haute Saône, S. Doubs, and the Swiss cantons of Neuchâtel, Bern, and Basle, and E. the Rhine, separating it from the territories of Baden. Area, 405,288 hectares. Pop. in 1846, 407,300. In the W. are the chains of the Vosges and Jura, one summit of the former, the *ballon d'Alsace*, rises to 4,874 ft. above the sea. The rest of the surface is mostly plain. Except the Rhine, the Ill is the only navigable river, but the canal between the Rhine and Rhone intersects the d^{pt.} in its whole length. As in Bas-Rhin, the most fertile portion of the surface is in the centre of the d^{pt.}, where agriculture is in a pretty advanced state. In 1826, the arable lands were estimated to comprise 168,571 hectares; meadows, 24,000 do.; vineyards, 11,141 do.; orchards,

The affluents of the Rhine are very numerous; but the chief tribes belong to the portion below Basle. The only navigable affluent above that point is the Aar, a stream which drains the greater part of Switzerland, and brings down nearly an equal volume of water with the Upper Rhine itself. It rises in the great mass of St. Gothard, passes through a narrow valley, in which is the cataract of Aarfall, 150 ft. in height, afterwards enters the lake of Brienz, and thence, after passing through the lake of Thun (1,875 ft. above the sea) runs past Berne, and enlarged by different tribes, bringing down the waters of lakes Lucerne, Wallendstadt, Zurich, &c., joins the main river at Coblenz (47° 26' N., and 8° 18' E.), with a wide and powerful current. Its chief affluents are the Reuss and the Limmath; the former rising on the N.W. side of Mount St. Gothard, receives the waters of lakes Lucerne and Zug, while the latter rises in the Oberland Alps, and runs through the lake of Zurich, both joining the Aar on its E. bank, about a mile from each other; both are navigable except during the spring floods, but owing to the rapidity of the current boats ascend empty.

Below Basle the Rhine is joined by many large tribes, the most important of which enter from the E. or right bank. The first of these is the Neckar, which falls into the main river at Mannheim, about 214 m. below Basle. It rises in the Black Forest, in about lat. 48° N., and 9° 30' E., and has a very tortuous course, first N.E., subsequently N.N.W., and lastly W., of more than 180 m. It is navigable for large barges up to Heilbronn, and for small craft as far as Stuttgart. The Mayn, which enters the Rhine at Mayence, or Mainz, about 30 m. below Frankfort, which is on its N. bank, is a most important tributary. Large river barges, vessels of 100 tons burden, ascend as high as Kitzingen, which is 165 m. from the mouth: its entire course is estimated at 220 m. (See Mayn.) The Lahn joins the Rhine about 48 m. below Mayence; it is about 140 m. long, but is not navigable above Limburg, 24 m. from the mouth. The Ruhr and the Lippe are two other considerable tribes, on the E. side; both navigable for about 100 m. The principal affluent on the W. bank is the Moselle, which rises on

pent between lofty and craggy mountains, and resembles rather a succession of lakes than a river. Here, indeed,

The river nobly foams and flows,
The charm of this enchanted ground,
And all its thousand turns disclose
Some fresher beauty varying round.

(Ottob. Harold.)

"These mountains, however, are after all only mountains in miniature. They have often, indeed, the steepness, rudeness, and overhanging ridges of the mountains bordering the Rhone; but, as compared to them in size, they are but molehills. The groves on the hill-sides are few and far between; but there is no grove without a church spire rising in the midst, and overtopping the trees. Frequently a daring and fantastic cliff, crowned by an ancient castle, frowns over the river, or rises majestically from the brow of the steep; but the woods, unlike those of the Rhone, look like plantations, and the vines obtrude an unceasing idea of the artificial." (*Letitia Ritchie's Travelling Sketches on the Rhine*, p. 79.)

The Rhine, with its various affluents, comprises a navigation of about 1,500 m., and, in a commercial point of view, is perhaps the most important river in Europe, owing to the numerous states to which it affords a water conveyance. The following table exhibits the extent of the states, or portions of the states, included within the valley of this great river:—

Switzerland	-	12,400 sq. m.	France	"	21,157 sq. m.
Prussia	-	15,000	Other Germ. States	-	9,041
Austria	-	800	Belgium	-	3,100
Baden	-	4,844	Netherlands	-	6,800
Bavaria	-	10,800			
Wurttemberg	-	5,280			55,228

The navigation of the Rhine has always been of considerable importance, but since the employment of steamers, and the abolition of the tolls, and other political obstacles to its free use, its importance as a channel of navigation and importance has been immeasurably increased. Vessels of large burden ascend the river to Cologne, and Strasburg is reached by those of 80 or 90 tons. Recently, however, steamers have been regularly established on the Upper Rhine, between Strasburg and Basle, and an astonishing increase has taken place in the number of passengers, and the quantity of goods passing up and down the river. In 1837, for example, the number of passengers conveyed along the Rhine, in the Prussian territories, amounted to only 21,452; whereas, in 1836, they amounted to 146,961, and now (1841) exceed 200,000! The increase in the quantity of merchandise conveyed along this great international highway has been equally great; and its importance will, no doubt, be still more rapidly increased by the opening of railways, and improved methods of communication with the great cities on its banks.

Besides the goods conveyed up and down the Rhine in steamers and sailing vessels, immense quantities of timber are sent down in the form of rafts. The smaller rafts from the Upper Rhine, and the smaller affluents of the river, used formerly to rendezvous at Namsdy, near Andernach, where they were consolidated into rafts of a larger size, that were sent down the river to Dordrecht, where they were generally broken up, and the timber sold and forwarded to its final destination. Of late years, however, the plan of constructing very large rafts has begun to fall into disuse, though, as they are still sometimes met with, the reader may not be displeased to have them described.

"A little below Andernach the little village of Namsdy appears on the left bank, under a wooded mountain. The Rhine here forms a bay, where the pilots are accustomed to unite together the small rafts of timber floated down the tributary rivers into the Rhine, and to construct enormous fleets, which are navigated to Dordrecht, and sold. These machines have the appearance of a floating village, composed of 12 or 16 little wooden huts, on a platform of oak and deal timber. They are frequently 800 or 900 feet in length, and 60 or 70 in breadth. The rowers and workmen sometimes amount to 700 or 800, superintended by pilots, and a proprietor, whose habitation is superior in size and elegance to the rest. The raft is composed of several layers of trees, placed one on the other, and bound together: a large raft draws not less than 6 or 7 feet of water. Several smaller ones are attached to it, by way of protection, besides a string of boats loaded with anchors and cables, and used for the purpose of sounding the river and going on shore. The domestic economy of an East Indian or an English man of war is hardly more complete. Poultry, pigs, and other animals, are to be found on board; and several butchers are attached to the suite. A well supplied boiler is at work night and day in the kitchen; the dinner hour is announced by a basket stuck on a pole, at which signal the pilot gives the word of command, and the workmen run from all quarters to receive their meates. The consumption of provisions in the voyage to Holland is almost incredible; sometimes amounting to 40,000 or 50,000 pounds of bread; 15,000 or 20,000 of

172,091 dollars, and that of the imports to 237,078 do. In the same year there belonged to the state 43,423 tons shipping. PROVIDENCE (which see) is the chief commercial town; and with Newport, the cap. and seat of government, Bristol, Warwick and Coventry are the other principal towns. Rhode Island is the only state in the Union without a written constitution; it continues to be governed by the provisions of the old royal charter. The governor and lieutenant-governor are chosen annually; and with 31 other members, compose the senate. The House of Representatives consists of 59 members, elected annually. The General Assembly, composed of these two chambers, meets once a year. The judicial power is vested in a supreme court, and a court of common pleas for each of the five cos. in the state. The judges, who receive no fixed salary, continue in office till removed by a vote of the General Assembly. The state appropriates 25,000 dolls. a year for the support of common schools; a larger sum is raised by the towns for the same purpose, and the instruction fund receives considerable aid from private contributions. The most numerous religious sects are Baptists and Congregationalists. The militia of the state consists of all able-bodied males between 16 and 45 years of age, with but few exceptions. There were 63 banks in Rhode Island in 1849, the aggr. capital of which amounted to 11,340,308 dolls. This state was first settled, in 1636, by a person of the name of Williams, banished from Massachusetts, on account of his religious opinions. Williams obtained a charter for Rhode Island and Providence Plantations in 1644; but, in 1653, the present ruling charter was granted by Charles II. Rhode Island suffered greatly during the revolutionary war. It sends two representatives to congress.

RHODES, a famous island of the Mediterranean, off the S.W. coast of Asia Minor (an. *Lydia* and *Cornu*), 10 m. S. Cape Volpe; the city of Rhodes, at the N.E. extremity of the island, being in lat. $36^{\circ} 27' 53''$ N., long. $28^{\circ} 19' 51''$ E. It is about 45 m. in length, N.E. and S.W., and is, where broadest, about 18 m. across. Pop., according to Savary, 36,500, of whom rather more than a third are Greeks; but Turner says it does not exceed 20,000. Probably it may be estimated at about 25,000, a number that would have been insufficient in antiquity to have peopled one of its three cities. A chain of mountains runs lengthwise from one end of the island to the other; their highest summit, Mount Artemis (an. *Atabyras*, on which was a temple of Jupiter), commanding a noble view of the island and of the adjacent shores of Asia Minor. In antiquity this mountain chain was covered with dense forests of pine, whence the Rhodians drew supplies of timber for their fleets, and in modern times it has supplied considerable quantities for the dockyards of Constantinople. Speaking generally, the soil in the lower parts is dry and sandy; but it has some fine valleys, and is well watered by the numerous streams that descend from the mountains. In antiquity it was famous for its fertility.—

A region pregnant with the fertile seed
Of plants, and herbs, and fruits, and food for grain:
Each verdant hill with number'd flocks does feed;
Unnumber'd men possess each flowery plain.
PURDIE, by Water: Olympic Odes, No. 7.

But, owing to the insecurity and extortion of which the inhab. have been long the victims, its agriculture is in the most depressed state, many of its finest fields being allowed to lie waste, and the island not producing corn sufficient even for its scanty population. Its wheat is still, however, of the finest quality; but, according to the statement of Mr. Turner, its wine, which he calls "tolerable, red, and sharp," must have sadly degenerated from that mentioned by Virgil as being fit for the feasts of the gods!—

Non ego te, Dile et membra accepta secundo
Transieris, Rhodis, et tunc, tunc, tunc, tunc,
Gurg. lib. II. lin. 101.

It also produces oil, oranges, citrons, and other fruits; and, but for the grinding despotism by

any. The engines of the columns are mostly from the same material as the Libyans for the and other engines used by Demetrius in the (which he gave up to them). It may be worth noting the fact, mentioned by Strabo that this is the only example to be found in antiquity of shipment of marble for the exchange of prisoners, as on the *Parthenon of Athens* (Libyans were subsequently ranked among the of the cities of Rome; they required tribute to make an altar on their city and continued their liberty till the reign of Vespasian, when was made a Roman province. The island was by the Romans but having been recovered by its conquerors, it was presented, in 1081, by the Emperor, to the knights of St. John of Jerusalem held it till 1522, when, after a desperate resistance taken by the Turks, under whose barbarous oppression it has sunk to the miserable condition we now find it. "Beauty and richness, a fertility of soil variety and abundance of natural agricultural produce, a situation favourable for commerce and a prosperous trade, nothing is to this fine island, except to be delivered from a, who possess, to an extent a degree, the fatal misfortune the most happy state into a spot to and desolate." (Lambert's *Travels in Greece* 1804, 1805, 1806, 1807, 1808, 1809, 1810, 1811, 1812, 1813, 1814, 1815, 1816, 1817, 1818, 1819, 1820, 1821, 1822, 1823, 1824, 1825, 1826, 1827, 1828, 1829, 1830, 1831, 1832, 1833, 1834, 1835, 1836, 1837, 1838, 1839, 1840, 1841, 1842, 1843, 1844, 1845, 1846, 1847, 1848, 1849, 1850, 1851, 1852, 1853, 1854, 1855, 1856, 1857, 1858, 1859, 1860, 1861, 1862, 1863, 1864, 1865, 1866, 1867, 1868, 1869, 1870, 1871, 1872, 1873, 1874, 1875, 1876, 1877, 1878, 1879, 1880, 1881, 1882, 1883, 1884, 1885, 1886, 1887, 1888, 1889, 1890, 1891, 1892, 1893, 1894, 1895, 1896, 1897, 1898, 1899, 1900, 1901, 1902, 1903, 1904, 1905, 1906, 1907, 1908, 1909, 1910, 1911, 1912, 1913, 1914, 1915, 1916, 1917, 1918, 1919, 1920, 1921, 1922, 1923, 1924, 1925, 1926, 1927, 1928, 1929, 1930, 1931, 1932, 1933, 1934, 1935, 1936, 1937, 1938, 1939, 1940, 1941, 1942, 1943, 1944, 1945, 1946, 1947, 1948, 1949, 1950, 1951, 1952, 1953, 1954, 1955, 1956, 1957, 1958, 1959, 1960, 1961, 1962, 1963, 1964, 1965, 1966, 1967, 1968, 1969, 1970, 1971, 1972, 1973, 1974, 1975, 1976, 1977, 1978, 1979, 1980, 1981, 1982, 1983, 1984, 1985, 1986, 1987, 1988, 1989, 1990, 1991, 1992, 1993, 1994, 1995, 1996, 1997, 1998, 1999, 2000, 2001, 2002, 2003, 2004, 2005, 2006, 2007, 2008, 2009, 2010, 2011, 2012, 2013, 2014, 2015, 2016, 2017, 2018, 2019, 2020, 2021, 2022, 2023, 2024, 2025, 2026, 2027, 2028, 2029, 2030, 2031, 2032, 2033, 2034, 2035, 2036, 2037, 2038, 2039, 2040, 2041, 2042, 2043, 2044, 2045, 2046, 2047, 2048, 2049, 2050, 2051, 2052, 2053, 2054, 2055, 2056, 2057, 2058, 2059, 2060, 2061, 2062, 2063, 2064, 2065, 2066, 2067, 2068, 2069, 2070, 2071, 2072, 2073, 2074, 2075, 2076, 2077, 2078, 2079, 2080, 2081, 2082, 2083, 2084, 2085, 2086, 2087, 2088, 2089, 2090, 2091, 2092, 2093, 2094, 2095, 2096, 2097, 2098, 2099, 2100, 2101, 2102, 2103, 2104, 2105, 2106, 2107, 2108, 2109, 2110, 2111, 2112, 2113, 2114, 2115, 2116, 2117, 2118, 2119, 2120, 2121, 2122, 2123, 2124, 2125, 2126, 2127, 2128, 2129, 2130, 2131, 2132, 2133, 2134, 2135, 2136, 2137, 2138, 2139, 2140, 2141, 2142, 2143, 2144, 2145, 2146, 2147, 2148, 2149, 2150, 2151, 2152, 2153, 2154, 2155, 2156, 2157, 2158, 2159, 2160, 2161, 2162, 2163, 2164, 2165, 2166, 2167, 2168, 2169, 2170, 2171, 2172, 2173, 2174, 2175, 2176, 2177, 2178, 2179, 2180, 2181, 2182, 2183, 2184, 2185, 2186, 2187, 2188, 2189, 2190, 2191, 2192, 2193, 2194, 2195, 2196, 2197, 2198, 2199, 2200, 2201, 2202, 2203, 2204, 2205, 2206, 2207, 2208, 2209, 2210, 2211, 2212, 2213, 2214, 2215, 2216, 2217, 2218, 2219, 2220, 2221, 2222, 2223, 2224, 2225, 2226, 2227, 2228, 2229, 2230, 2231, 2232, 2233, 2234, 2235, 2236, 2237, 2238, 2239, 2240, 2241, 2242, 2243, 2244, 2245, 2246, 2247, 2248, 2249, 2250, 2251, 2252, 2253, 2254, 2255, 2256, 2257, 2258, 2259, 2260, 2261, 2262, 2263, 2264, 2265, 2266, 2267, 2268, 2269, 2270, 2271, 2272, 2273, 2274, 2275, 2276, 2277, 2278, 2279, 2280, 2281, 2282, 2283, 2284, 2285, 2286, 2287, 2288, 2289, 2290, 2291, 2292, 2293, 2294, 2295, 2296, 2297, 2298, 2299, 2300, 2301, 2302, 2303, 2304, 2305, 2306, 2307, 2308, 2309, 2310, 2311, 2312, 2313, 2314, 2315, 2316, 2317, 2318, 2319, 2320, 2321, 2322, 2323, 2324, 2325, 2326, "Here let us sweep
The boundless landscape.
Heavens! what a goodly prospect spreads around,
Of hills and dales, and woods and lawns, and spires,
And glittering towns and gilded streams, till all
The stretching landscape into smoke decays."
Thomson's *Summer*.

The church is a respectable structure, with a low embattled tower, and, till 1658, was a chapel-of-ease to Kingston, to the rector of which par. the patronage still belongs. It has been much enlarged and repaired within the last century; and contains the remains of Thomson, the poet of the *Seasons*, who died here on the 27th of Aug. 1748, of Dr. Moore, author of *Zeluco*, and of *Views of Society in France, Italy, &c.*, Gilbert Wakefield, the scholar, Kean, the actor, &c. A new district church has also been recently erected in the pointed style. There is a Rom. Cath. chapel, and the Independents, Baptists, Wesleyan and Calvinist Methodists, have places of worship, to most of which Sunday-schools are attached. A charity-school, founded here in 1713, and subsequently endowed, furnishes gratuitous instruction to about 250 poor children, 60 of whom receive clothing. There are also three sets of almshouses, with pretty considerable endowments, and numerous money charities. A theatre is open during summer, and there are several excellent hotels, that on the hill, already alluded to, being a very extensive establishment in a magnificent situation.

Richmond is infinitely more a place of pleasure than of business, though it has a considerable retail trade for the supply of the resident families and visitors. It is a principal resort of visitors from London during the summer months, conveyed thither partly by railway and partly by steamers and row boats: on the whole, however, the influx of visitors to Richmond, at least of the middle and lower classes, has materially diminished since the establishment of steamers on the river to Greenwich, Woolwich, Gravesend, &c.

Richmond park, the principal entrance to which is at the W. end of the terrace contiguous to the Star and Garter Hotel, formed by Charles I., comprises an area of 2,253 acres, being about 8 m. in circ. It consists mostly of poor soil; but has a great variety of surface, is well stocked with deer, and perfectly open to the public. The great lodge, which stands on rising ground, commanding a fine prospect, was built by Sir R. Walpole, ranger during the reigns of George I. and II., at an expense of 14,000*l*. Here, also, is a new or stone lodge, built for a hunting seat by George I., and given by George III. to Lord Sidmouth, by whom it was occupied till his death.

What is called the *Old Park* extends along the Thames from Kew to Richmond, and includes the royal gardens and pleasure-grounds attached to Kew Palace (see *Kew*). This park is, however, inaccessible to the public, except on certain days; and is considered as belonging rather to Kew than to Richmond.

The *Green*, at the bottom of the town, forms a parallelogram almost as large as Lincoln's Inn Fields; it is used in summer for playing matches at cricket, bowls, &c.: on one side of the green is a handsome public walk.

Richmond (formerly called *Sæcen*) was for centuries the site of a royal palace; but at what period it was erected is uncertain, though it became a fixed residence of royalty as early as the 14th century. Henry V. rebuilt it in a magnificent style. Henry VII. held a tournament here, in 1492, soon after which, the building having been destroyed by fire, a new palace was erected by that monarch, who gave the manor its present name, being that of his own title, previously to his accession to the crown: he died here in 1509. But its principal distinction consists in the fact, that when the emperor Charles V. visited England in 1523, he was lodged in this palace. Queen Elizabeth was imprisoned in it by her sister Mary, and it afterwards became one of her favourite palaces, and here she died, on the 24th March, 1603. During the commonwealth, the palace was sold by the parliamentary commissioners for 10,783*l*.; and the whole appears to have been then dismantled and demolished, nothing now remaining except a few of the out-offices, its site being occupied by several modern mansions held on lease from the crown. On the N. side of the palace once stood a monastery, founded by Henry V., for Carthusian monks, the revenues of which, at the dissolution, were estimated at 963*l*. A Franciscan convent, founded here in 1499, by Henry VII., was suppressed with the other in 1534.

The custom of Borough English, by which, in the event of the father's dying intestate, lands descend to the youngest son, or, in default of heirs male, to the youngest daughter, prevails in the manor of Richmond.

RICHMOND, a city and port of entry of the U. S. of N. America, cap. state of Virginia, on James River, about 150 m. from its mouth in Chesapeake Bay, and 106 m. S.S.W. Washington; lat. 37° 30' N., long. 77° 31' W. Pop. in 1830, 16,060; in 1840, 20,153, and inc. its suburb of Manchester, on the opposite bank of the river, it may now (1850) have 30,000 inhabs. "The

situation of Richmond is very striking. The town is built on rising grounds of various shapes, descending to the eastward; but though it possesses every facility for being kept free from filth, it is the dirtiest city, with the worst kept pavements and streets, that I have seen in this country." (*Stuart, Three Years in America*, ii. 72.)

The chief street is handsome and spacious; and there is a fine square, covering about 10 acres, planted with trees, and laid out in gravel walks. In this square is the capitol, an elegant building on the model of the *Maison carrée* at Nîmes, erected shortly after the war of independence. It has a statue of Washington, by Houdon. A public library has been established in the senate hall, which has also a portrait of Jefferson. Near it is the city hall, a neat Doric structure. The churches are numerous, and one occupies the site of the theatre destroyed by fire, with great loss of life, in 1811. The Virginian armory, the penitentiary, and a new theatre, include the other chief objects of notice. The city is abundantly supplied with water from three reservoirs. Richmond is favourably situated for commerce. It stands at the head of the tide-water, in James River, and is connected by James River Canal with Buchanan, 175 m. distant, and by railways with Aquia Creek and Petersburg. It is consequently the natural dépôt for the wheat, hemp, and other produce of a large extent of country. Immediately above the city are some falls, beyond which the river is navigable by boats for upwards of 200 m. The falls supply valuable water power, which is used to work flour, cotton, paper, and rolling mills. Richmond has also a cannon foundry, tobacco factories, &c. The suburb of Manchester is connected with Richmond by two bridges; and with some coal-mines, 13 m. distant, by a railway. But, notwithstanding its numerous advantages, neither the foreign trade nor the shipping of Richmond is so considerable as might have been expected. There belonged to the port, in 1849, 10,332 tons shipping.

RICKMANSWORTH, a market-town and par. of England, co. Herts., hund. Cashio, on the Gade, 18 m. N.E. London. Area of par., 9,740 acres. Pop. in 1841, 5,026. The parish church has been rebuilt within these few years, with the exception of the embattled tower, which belonged to the old church. The living, a vicarage, in the patronage of the Bishop of London, is worth about 510*l*. a year. It has an endowed national school, and other minor and Sunday schools, and two almshouses. It is governed by two constables and two head-boroughs. In its vicinity are several streams, on which considerable flour and paper mills have been erected. Its trade is facilitated by the Grand Junction canal, which passes close by the town. Moor Park, a seat of the Marquis of Westminster, in the vicinity, was once the residence of Cardinal Wolsey; but it has since been rebuilt in the modern style; the grove, belonging to Lord Clarendon, and other seats, are also in the immediate neighbourhood.

RIGA, an important city and river port of European Russia, cap. of Livonia, on the Dwina or Duna, about 9 m. from its embouchure in the gulph of Riga, lat. 56° 57' 12" N., long. 24° 0' 4" E. Pop. in 1835, including the garrison of 10,000 men, 67,338. About two thirds of the resident population are Lutherans, the rest consisting of members of the Russo-Greek church, Catholics, &c.

Riga is strongly fortified. It consists of the town, properly so called, and the suburbs; the former being entirely inclosed by the fortifications. Streets in the town narrow, crooked, and houses generally brick: in the suburbs, which are much more extensive, the streets are broad and regular, and the houses mostly of wood. One of the suburbs lies on the left bank of the river, the communication with it being maintained by a floating bridge about 2,400 ft. in length.

Among the public buildings are the cathedral, consecrated in 1211, and rebuilt in 1547; the church of St. Peter, built in 1406, with a tower 440 ft. in height, being the most elevated in the empire, and commanding a fine view of the city and adjacent country; the castle, the seat of the chancery, and of the general and civil governors; hall of the provincial states; town-house; exchange; arsenal, &c. A magnificent column, surmounted by a colossal bronze Victory, was erected in 1817, by the mercantile body, in honour of the emperor Alexander and the Russian army.

Among the literary establishments are a gymnasium, a lyceum, a school of navigation, and various elementary schools, a public library, an observatory, a society of Lettonian literature, &c. Manufactures of no great importance, though, of late, materially improved. In 1835 there were in the city 25 different manufacturing establishments, employing in all 1,297 workmen, of which those of cotton, cloth, and rugs, were the most important. There are also various sugar-houses, tobacco manufactories, breweries, &c.

Owing to her situation on a large navigable river, Riga is the entrepôt of an extensive country; and is, in respect of foreign commerce, the next town in the Rus-

erecting numerous specimens of the tree plant. Near the Imperial palace is the public library, containing from 50,000 to 75,000 vols. Several daily and weekly newspapers issue from the Rio press, but they are said to be, without exception, the most worthless publications of their class any where to be met with. The police and health of the city have been materially improved within the last dozen years.

The market-place consists of a collection of dirty booths, for the sale of vegetables, which are at once abundant, excellent, and cheap. The farina of the *Jandupha Manihot* is here the grand substitute for bread stuff, and is extensively used by all classes, forming, with beans, the principal food of the negroes. The Yam supplies the place of the potato, and the finest oranges are sold at from 10 to 20 cents per 100. Butcher's meat is sold in shops, scattered up and down the city. The beef, though wholly without fat, is tender. Pork is good, mutton bad and dear. Fish abundant and good. The slave-market, described by Basil Hall and others, no longer exists, but the clandestine importation of slaves is still carried on to a very considerable extent. (Three Years in the Pacific, 1 100.) Slaves, however, are speaking generally very indulgently treated. "We may," says a Rio circular, "assure our philanthropic friends abroad, that as regards the slaves, they are here better fed, better clothed, are on the whole better treated, laugh more and weep less, than the major part of the labouring poor in Europe."

Coffee.—The trade of Rio is very extensive, and has increased rapidly during the last few years. It is now by far the grandest mart for the export of coffee. The shipments of this important article which, in 1800, amounted to 37,500 bags, have increased with such unexampled rapidity that, in 1847, they amounted to above 1,200,000 bags, that is (taking the bag at 14 lbs.), to 264,100,000 lbs., or 112,280 tons, being equal to all the exports of coffee from all the other parts in the world, hitherto excepted! Sugar was formerly an important article of export from Rio, but lately it has been decreasing, and does not now exceed 6,000 casks (16 cwt. each), the exports of sugar from Santos, which used to be considerable (10,000 tons), have, also, been lately decreasing (see Santos). The other great articles of export from Rio are hides, rice, tobacco, rum, tannin, bromelain, madder bark, and other inferior articles. The export of cotton has almost entirely ceased; and that of gold, diamonds, &c., is mostly clandestine, and not very considerable. We omit.

Arrivals and Departures of Shipping at Rio de Janeiro, Oporto, and Foreign, in each Year from 1845 to 1849 Inc.

Year.	Oporto.				Foreign.			
	Arrivals.		Departures.		Arrivals.		Departures.	
	Flags.	Tons.	Flags.	Tons.	Flags.	Tons.	Flags.	Tons.
1845	5,373	155,379	5,380	179,120	578	204,200	581	174,200
1846	5,550	160,700	5,400	191,330	581	204,210	1,000	311,700
1847	5,587	160,340	5,775	193,700	581	204,210	900	290,000
1848	5,588	162,100	5,500	190,000	1,100	300,000	1,000	300,000
1849	5,587	162,336	5,500	190,000	1,100	300,000	1,100	300,000

Of the vessels which arrived in 1849, 793 had on board cargoes for the port, 500 were en route for California, 100 were in ballast, and 100 had on board cargoes for other destinations. Among the 793 vessels with cargoes for the port were 120 American, 120 English, 60 Portuguese, 60 Brazilian, 60 Danish, 60 French, &c.

The currency of Rio, and of Brazil generally, is in a very vitiated state. The par of exchange, when the silver currency was maintained, was 64d., and the current rate was usually higher, but for some years past, owing to the introduction of paper and copper, the exchange has fallen, so that its average rate in Rio, in 1848, was 50d.

Harbour.—As already stated, the harbour of Rio is one of the finest in the world. Its entrance is marked by a remarkable hill, in the form of a sugar loaf, 900 ft. in height, close to its W. side, while on the opposite side of the bay, at the distance of about 1½ m. is the fort of Santa Cruz, on which is a light-house. There is, also, a light-house having the lantern elevated about 300 ft. above the sea level, on *Ilha Rasa* (Flat Island), about 10 m. S. from the mouth of the harbour. Ships may enter either by night or day there being no obstruction or danger of any kind. The water in the bay is sufficient to float the largest ships of war, and it is extensive enough to accommodate all the navies of all the countries in the world.

RIO (an *Rio-nagras*) a town of France, dep. Pyr.-do-Dôme, cap. around, on a hill, 6 m. N. by S. Clermont. Pop., in 1846, ex. com., 9,300. It is well built; but the houses are mostly in an antiquated style, and being wholly constructed of Volvic lava, with which it is also paved, it has a singularly sombre appearance. It has several handsome public buildings, and its churches, hospitals, the various public offices, and the sub-prefecture, are good buildings. One of its promontories is surrounded with a chain of Donis.

Riom is the seat of a royal court for the dep. Pyr.-do-

An Account of the Quantity of Coffee exported from Rio in the following Years:—

Year.	Cms.	Year.	Cms.
1844	9,300	1846	9,310
1845	11,200	1847	9,311
1846	9,370	1848	10,340
1847	9,376	1849	9,370
1848	14,300		

Of the quantity shipped in 1847, were to the U. States, 700,700 bags; Hamburg, 204,310 do.; Antwerp, 127,000 do.; Trieste, 110,300 do.; and to other parts, 400,000 do.

Sugar.—Quantity of Sugar in Cms exported from 1841 to 1849 Inc.:

Year.	Cms.	Year.	Cms.
1841	9,300	1846	9,310
1842	11,200	1847	9,311
1843	9,370	1848	10,340
1844	9,376	1849	9,370
1845	14,300		

Hides.—Quantity shipped from 1841 to 1849 Inc.

Year.	Cms.	Year.	Cms.
1841	100,100	1846	100,100
1842	100,100	1847	100,100
1843	100,100	1848	100,100
1844	100,100	1849	100,100

There were also exported in 1849, 11,100 half-skins hides, 200,000 ox and cow horns, 4,000 pipes rum, 20,000 rolls tobacco, 30,717 bags rice, 20,000 planks macramé, 9,343 barrels tannin, and 11,076 lbs. bromelain.

The principal article of legitimate export consists of coffee goods, the value of which amounts to full one-third of the total value of the exports. Next to coffee are cotton, linen, and silk manufactures, wines, jewelry, and ironmongery, flour, meat, fish, butter, and other articles of provision, spirits, oil, medicines, paper, and a host of other articles. The imports of slaves into the bay of Rio and the adjoining prov. are sometimes very extensive.

Dôme, Allier, Cantal, and Haut-Lain; and of trifles of primary fertilisers and condiments. It produces cotton and linen cloths, candles, leather, and tawdry; and has a large trade in agricultural produce. It was formerly the cap. of Auvergne, and the residence of its dukes, some remains of whose castle still exist, and it continues to rank as the second town within the ancient limits of that province. Among the distinguished individuals belonging to Ripon may be specified Gregory of Tours, and the learned Jacinto J. and A. Struand. (Hug. art. *Pap-de-Dôme*, *Dur Gég*, &c.)

RIPON, a city and town, bar and market-town of England, N. riding on York, lower div. wap. Clere, on the Ure, close to its confluence with the Wharfe, both of which are here crossed by stone bridges, 50 m. N. W. York. Pop. of par. bur. (which comprises the township of Ripon with part of the district of Sandesley) in 1841 5,397. The appearance of Ripon is that of a very respectable and wealthy country town. It is increasing in population, and, though it has no manufactures itself, there is an extensive manufactory of millstons in Sandesley. The neighbouring country is rich and well wooded, containing many objects of local interest and interest, and this may, perhaps, account for the fact, that of late years many respectable families have been induced to settle here. The town has, therefore, increased in importance as a residence for persons of that class. (Par. Bound Report.) The streets are irregularly laid out, but clean, and well lighted with gas, many of them meeting in the market-place, a spacious square surrounded with good shops, &c., having in its centre an obelisk 90 ft. in height, surmounted by the city arms, and on its S. side a particularly handsome town-hall, comprising courts, offices, and a handsome room for balls and public meetings. Ripon cathedral, erected in 1085 into a cathedral, and built in the 14th and 15th cen-

tain, is said to be one of the best proportioned churches in England. It is a cruciform structure, with a tower rising from the intersection of the nave and transepts, beside two others (each 118 ft. in height) at the W. end. Its length, from E. to W., is 265 ft.; breadth of choir and aisle, 67 ft., and length of transepts, 120 ft. "This remarkable edifice," says Mr. Brim, "contains various parts worthy of attention, particularly in W. front, a very fine specimen of bold early English, and except the battlements and pinnacles, without alteration. A part of the church is Norman, and a great portion of the transepts but little later. The choir is partly Norman and S. of it is a Norman crypt, above which are some Norman buildings used as vestries. At the E. end of the choir, which is easily distinguished by heavy modern galleries, is a decorated S. window of fine light with very elegant tracery. The aisle is very light, exhibiting some extremely fine composition, and there is a considerable quantity of good carved work, both in wood and stone." The chapter comprises a dean, subdean, and six canons, who divide among them a net revenue of £331. Ripon was erected into a bishopric in 1083, the diocese comprising most of the parishes of the W. riding, with the County of Richmondshire in the N. riding. The annual revenue of the see is £4,500, chiefly derived from the surplus fund formed out of the deductions from the revenues of the larger sees. Trinity church, built and endowed in 1855 at a cost of above £3,000, is a Gothic rectory structure, with lancet windows, and has accommodation for upwards of 1,000 persons. The Wesleyan Methodists have two places of worship, and there one each for Independents and Primitive Methodists. The town has several Sunday schools, besides which are national schools both for boys and girls, and an endowed blue-coat school. A grammar-school, founded 1554, has an endowment producing about £700 a year. A free for Latin, Greek, and English grammar, is the gift of all residents, besides whom the master may receive boarders and pay-scholars. The town has several almshouses, many charities, &c.; and a dispensary furnishes relief to the sick poor. A mechanics institute, scripture library, and news-rooms, are comprised in a public rooms; a large and rather handsome building, erected by subscription, having attached gardens and acre-grounds. A theatre was built in 1798; but it has been converted into a depot and riding school for the 1st Hussar cavalry. The town was formerly celebrated for its manufacture of cloth, and the expression, "as true steel as Ripon is," was once proverbial for men of integrity and fidelity. It had also a considerable manufacture of iron-plate; but both these branches of industry have ceased to exist. Loom-weaving, making, and so on are pursued to some extent; and, as seen above, dresses and suitcases are made in pretty large quantities. It is a large staple for wool, bought up here by shippers of Leeds, Halifax, &c. and it has an excellent market. In 1797, the Ure navigation was brought up to the town, which is thus rendered necessary for the carrying of 30 tons. The Knaresborough and Clapham company and Wetherby banking company run their boats here, and, in addition to these, there are two boats and a savings' bank.

Ripon is a bar, by prescription, but removed a charter from it. Under the Municipal Reform Act it is governed by a mayor, 8 aldermen, and 12 councillors. Corporation revenue in 1847-8, £364. The bar has a court of the peace under a recorder, a county court, which 446 plaints were entered in 1848; and a coroner's court held by the dean and chapter, having jurisdiction over the district called "cesson de" Ripon.

Ripon is in the H. of C. since the reign of V. I., the right of election being previously to the Act, in the holders of burgage tenements all held, for many years, been in the possession of a individual. The limits of the par. bar, as by Boundary Act, comprise the entire township with a part of the township of Almsbury. Large Rag electors in 1848-49, 225. Large a Thursday, abounding with all kinds of agriculture, and six yearly fairs.

It derives its name from its position on the river Ure; but whether it be of Roman or Saxon origin is wholly unknown. A monastery, in A. D. 651, attained considerable celebrity; it was destroyed by the Scotch in the reign of E. I., and was not afterwards restored.

RIVE-DE-GIER, a rapidly increasing town of France, dep. cant., on the Gier, a tributary of the Loire, head of the canal of Orléans, and on the R. St. Etienne to Lyons, 13 m. N. E. the town. S. W. the latter. Pop. in 1846, 10,000. It has since considerably increased. It was fortified, but its works have been destroyed, principally remarkable for its commercial and manufacturing importance, and for its growing prosperity of the

country along the Rhone (which see), and the districts round Lyons and St. Etienne. It has extensive manufactures of glass ware; and its coal-mines furnish a large proportion of the coal required in the hardware factories of St. Etienne. It has also hardware manufactures of its own. The offices of the Gier Canal company and the noble reservoir belonging to that canal, are the most remarkable public works at Rive-de-Gier. (Hug. &c.)

ROANNE (supposed to be the *Reduana* of Ptolemy), a town of France, dep. Loire, cap. arrond., on the Loire, here crossed by a new bridge, 30 m. N. Moulins. Pop. in 1836, 10,000. It is a pretty, well-built, open, struggling town, with a good quay, a large hospital, a handsome theatre, and a commercial college, having a good library and cabinet of natural history, &c. It is the seat of a tribunal of original jurisdiction, and a chamber of manufactures, and is a depot for the manufactures of Lyons and the S. E. of France, passing to the central and S. W. depes. It also manufactures textiles, cottons, and woollen fabrics, and has some trade in

wool, a small theatre, a commodious goal, and work-houses. The parish church, a structure of Norman and early English architecture, with a square pinnacled tower, stands on an eminence, to which there is an ascent from the lower part of the town by a flight of 135 steps. The living is a vicarage, of the annual value of £1,700, in the gift of the Archbishop of Canterbury. The town has also two episcopal chapels; and within the par. are six others, chiefly in the patronage of the vicar. Here is a Rom. Cath. chapel, and 13 places of worship for different denominations of dissenters, among whom Methodists, Independents, and Baptists are the prevailing bodies. Each church and chapel has a Sunday-school, attended by great numbers of children. The town has a large national school, another well-endowed establishment, called the *Maison d'école*, for the gratuitous education of 60 boys and 30 girls; a free grammar-school, founded in 1664, and attended by about 60 boys (who, owing to the endowment of the endowment, pay a fee of 6s. a year); an endowed girls' school, and numerous money charities. A dispensary and ladies' charity furnish relief to the sick poor; besides which, there are infirmary, and other religious associations, a literary society, an horticultural society and a savings' bank.

Rochdale is a principal seat of the woollen and cotton manufactures, especially the former. The woollen articles produced here consist principally of hosiery, shawls, and kerseys; and those of cotton of strong cottons, flannels, &c. In 1835, there were in the parish (exclusive of Saddleworth township) 50 woollen mills, 50 cotton, and one flax mill, propelled by an aggregate steam power of 1,500 horses, employing, in all, 5,740 hands, of which 3,130 belonged to the cotton trade. There are also numerous hand loom weavers, though power-looms have been extensively introduced within the last few years. Hat-making is pursued on a pretty considerable scale, and numerous hands are employed in the town and neighbourhood in making machinery. The Manchester and Liverpool District Banking Company have a branch here, and there are two private banks. Coal and stone abound in the neighbourhood, and the par. comprises 10 collieries. Iron ore has been found in considerable quantities in Saddleworth township, and flags are quarried at Spotland. Rochdale has means of communication with Manchester and Liverpool westward, and with Halifax, Leeds, &c. eastward, both by canal and railway. The Rochdale Canal, which passes near the town, uniting westward with the Duke of Bridgewater's Canal, and eastward with the Calder and Rhine Navigation, 30 m. in length, cost upwards of £80,000, and is supplied, at its summit level, by large reservoirs, one of which covers 120 acres. It was opened in 1804, and the daily traffic may amount to 1,400 tons. The Manchester and Leeds Railway passes through the district, and in Calderbrook township is a tunnel 1,800 yds. long, chiefly cut through the solid rock, 80 ft. below the surface. The total length of the line is 80½ m., and the whole is now open.

Notwithstanding its pop. and manufacturing importance, Rochdale had no representative in the legislature

had precipitous edges; but excepting this, and the Capitoline hill, comprising about 16 acres, the rest have an easy ascent, and are, in fact, mere eminences. No doubt, however, owing to the accumulation of rubbish in the valleys, and the lowering of the hills by rains, the digging of foundations, &c., the elevations of the latter must have been much more striking in antiquity than at present. The seven hills, properly so called, on the E. bank of the Tiber, were included in the city so early as the reign of Servius Tullius; but at a later period the *Mons Pincius* (*Pincian hill*), to the N.E., and the *Mons Vaticanus*, and part of the *Mons Janiculus*, on the W. side of the Tiber, were enclosed within the city walls. The hills consist chiefly of volcanic tufa intermingled with thin beds of travertine, making good building stone, as well as of silicious sand, and a few layers of pumice and scorix; while the low ground which has been raised several feet above its ancient level, apparently by the deposits left by frequent floods, is covered with calcareous sands, marls, clays, or silt.

Rome is divided into 14 districts, or *Rioni*, 11 of which are in the portion now inhabited; but the more popular, and for general purposes more intelligible, distribution of the city is into a central portion on the low ground E. of the Tiber, the ancient Campus Martius, a division to the E. of the latter, on the Pincian, Quirinal, and Viminal hills, and a third division on the W. side of the river. The first of these quarters is the chief seat of bustle and trade: it is intersected by the Corso, and has some other good streets. On the N.W. side of the Capitol is the meanest and dirtiest part of the city, chiefly inhabited by Jews, and many degrees worse than Monmouth Street or Houndsditch in London. The upper part of the city on the Pincian and Quirinal hills is less densely covered with houses, and chiefly comprises palaces and villas, churches, convents, and gardens; it is intersected near the pope's palace on the Quirinal hill by two fine avenues, crossing each other at right angles, and having four fountains at the point of intersection. Between the Quirinal and Esquiline hills are several streets inhabited by the lower orders, and extending to the Via Vaccina, a rather broad thoroughfare leading to the Roman forum. Beyond, N., E., and S., are gardens and fields, studded here and there with villas, churches, and ruins, including the baths of Diocletian and Titus, and the Colosseum. That portion of Rome which lies on the right or W. bank of the river, consists of two parts: the Vatican, northward, in which are comprised the castle of St. Angelo and St. Peters, the glory not merely of the eternal city but of Christendom; and the Trastevere or ancient Janiculum, southward, which has the street, called from its length (nearly 1 m.), Via Longara, a botanic garden, and the Villa Corsini.

Rome, meaning the modern city (as we shall afterwards notice the ruins), is dull, dirty, and, with a few striking exceptions, meanly built: "Indeed," says Mr. Forsyth, "whichever road you take, your attention will be divided between magnificence and filth." (*Italy*, p. 124.) Most of the streets are narrow, crooked, and badly lighted with melancholy-looking *reverberes*, or else by lamps hung over the statues of the Virgin, which seem to be indispensable to all considerable houses. From this general censure, however, must be excepted the Corso, already alluded to, extending, in a straight line, more than a mile, from the Porta del Popolo to the foot of the Capitoline hill, and which, in the greater part of its extent, is 50 ft. wide, with *trottoirs* at the sides, which, however, are so narrow, and so often encroached on, as to be, in fact, of little service: it is lined with many handsome palaces, some of which may vie in grandeur with the noblest in Italy. Two other streets, the *Strada di Ripetta* and the *Strada del Babuino*, diverging from the open space before his holiness' palace, are long, straight, and tolerably wide. These three streets are crossed by a line connecting the bridge of St. Angelo with the Pincian hill, and forming one of the most bustling thoroughfares in Rome. With these exceptions, however, the streets are mean looking, and the houses have a shabby, dilapidated appearance, wholly unworthy so celebrated a city. The private houses are usually from three to five stories in height, built of tufa or brick, and plastered over. With these are intermingled many huge old buildings (*palazzi*), contrasting most strikingly with the surrounding slight, mean tenements, by their bulk, height, and air of antique grandeur. In consequence, however, of the decay of the families to which they belong, many of them are now turned into ecclesiastical colleges or hotels, or let to foreign ambassadors or noblemen; and in those which have escaped this fate, the lower story is sometimes let for shops, and sometimes retained for stables, coach-houses, and servants' rooms. The second story is generally a picture gallery, consisting of a suite of rooms all opening into each other, and richly adorned with marble and painted ceilings. The owner of the building occupies the third story, or, if there be a fourth, the third and fourth,

throwing open his galleries to artists and all who choose to give two or three *paoli* to his servants. "The great size of many of the palaces, and the abundance as well as bold projection of the ornaments, produce, indeed, a general impression of magnificence; but if we can get space enough in front to examine the parts distinctly, we often turn away dissatisfied with the absurdity and disproportion they exhibit. Generally speaking, these buildings exhibit great simplicity of design, usually presenting to the street one simple continued line of surface, rarely decorated either with columns or pilasters. Ornaments round the windows are never omitted, but are generally too large, and in bad taste. The stories are generally divided by horizontal mouldings along the front, and great space is left between the ranges of windows. The whole is crowned by a large and rich cornice." Such, according to Woods (*Letters of an Architect*, i. 438.), is the general external appearance of the best among these *palazzi*, of which Rome comprises in all upwards of 300, many, of course, being very inferior both in size and architectural beauty.

Rome has not a single square; and of the piazzas or paved areas, the Piazza del Popolo, the Piazza Navona, and that in front of St. Peter's, are the only three that deserve notice. They are adorned with obelisks, statues, and fountains; but the first and last being at the extremities of the town, are lost as places for walking in or meeting friends. The fine promenade on the Pincian hill, E. of the Piazza del Popolo, is planted with trees, and commands an extensive view; but it is of small extent, and is shut at sunset. Without the walls, however, on the N.E. side of the city, is the Villa Borghese, the grounds of which, nearly 3 m. in circ., planted after the fashion of an English park, and ornamented with statues, fountains, &c., are open to the public, and constitute the favourite resort of all classes, whether on foot or in carriages. Rome, like London and Naples, is destitute of promenades sheltered from the weather, and well lighted at night, a convenience which Paris has in perfection; and another defect is the absence of elegant shops, cafés, and restaurants, that form so striking a feature in the French capital. In the number and grandeur of its public fountains, however, and in the quality of its water, Rome surpasses every city. Almost every public piazza has its fountain, and almost every fountain has some peculiarity in its size, form, or situation, to attract attention. The finest of these, and perhaps the most magnificent in the world, is the fountain of Trevi, which has a white marble basin in a vast inclosure paved with large slabs of the same material. It represents a palace of Neptune placed on a rough, broken rock, and adorned with Corinthian pillars; in the centre of the building, under a rich arch, stands Neptune in his car drawn by sea-horses; and water runs down in torrents from the rock, making, as it were, a sea at its base. In the summer the waters overflow their usual limits, fill the whole marble basin, and rise to a level with the square, which after sunset is a favourite lounge of the inhabitants. The fountain in the Piazza Navona has an obelisk in its centre, surrounded by Tritons and Naiads, seated on rocks, and spouting forth water in magnificent *jets d'eau*. The *Fontana Felice*, on the Viminal hill, discharges itself under an Ionic arcade through a rock, which a figure of Moses is striking with his rod. Other figures surround the prophet, and below are four lions hanging over the basin, as if eager to slake their thirst. These and the other fountains of the city are supplied from three only out of the numerous aqueducts which attest the luxuriance of the ancient city; and yet such is the quantity they convey, and so pure are the sources whence it is derived, that no city can boast of such a profusion of clear and salubrious water, poured forth spontaneously in *jets d'eau* without the aid of expensive machinery, as at Versailles, St. Cloud, and Chatsworth.

But, after all, water at Rome would seem to be provided rather for show than for use. Forsyth says that when he visited the city, the fountain of Trevi was inaccessible from filth! (P. 124.) There is, generally, in fact, a great deficiency of cleanliness, and a limited consumption of water, in all cities supplied by fountains, and wherever, indeed, it is not conveyed by pipes into private houses, and placed, as it were, under the hand of the occupiers.

The great glory of modern Rome consists in the magnificence of her churches, or rather in the matchless structure of St. Peter's.

"— thou, of temples old, or altars new,
Standest alone — with nothing like to thee —
Worthiest of God, the holy and the true.
Since Zion's desolation, when that He
Forsook his former city, what could he,
Of earthly structures in his honour pl'd,
Of a sublimer aspect? Majesty,
Power, Glory, Strength, and Beauty, all are aid
In this eternal ark of worship undefil'd."

This magnificent fabric occupies the site of an older structure raised by Constantine the Great. Pope Julius II. laid the first stone of the new building on the 18th

built on the site of an older structure in the beginning of the 14th century. Its front, consisting of a magnificent colonnade, is certainly impressive, notwithstanding its numerous faults. There are 5 entrances; that in the centre having a bronze door taken from the Temple of Peace in the Forum; and on the top of the façade are 15 statues of our Saviour, and various saints. The interior is divided into 5 aisles, and in the pillars of the nave are colossal statues of the Twelve Apostles: this church comprises also a chapel of the Corsini family, in the form of a Greek cross with a central dome, gorgeously decorated with marbles, gilding, and pictures, and said to be one of the richest in Rome. Adjoining this church is a palace, which, after having been for many centuries the residence of the popes, was converted, in 1683, into an hospital for the poor; and at no great distance is the Scala Santa, a building celebrated for containing a staircase of 28 white marble steps, alleged to have belonged to the palace of Pilate at Jerusalem, and which orthodox Roman Catholics esteem a meritorious act of piety to ascend on their knees; indeed, so great is the number of the devotees, that, with a view to the preservation of the steps, they have been covered with planks of wood. At the top is a painting of our Saviour at the age of twelve, begun by St. Luke, but finished by miraculous agency! (*Burton's Rome*, ii. 177.) The church of St. Paul's, outside the walls, one of the handsomest in Rome, and in many respects superior to that of St. John Lateran, was burnt down in 1823, and is now in course, though very slowly, of being rebuilt. The basilica of St. Maria Maggiore is a very fine and large edifice; but the profusion of its ornaments takes from the unity of the main design, and the narrow brick tower, rising above the whole, is in very bad taste. The interior has three aisles, the central one being lined by 36 Ionic pillars of white marble, which have a very beautiful effect: they are undoubtedly ancient, and may have belonged to the temple of Juno Lucina, that formerly stood here. A chapel in this church, belonging to the Borghese family, deserves notice for the richness of its decorations. The church of St. Pietro in vincolo, originally erected about a.d. 420, but since wholly rebuilt, presents to the eye a noble hall, supported by 20 Doric columns of Parian marble, open on all sides, adorned with some beautiful tombs, and terminating in a semi-circle behind the marble. But it is principally remarkable for its containing the tomb of Julius II., illustrated by the noble statue of Moses by Michael Angelo.* The other churches are so numerous that it would be an almost endless task to describe them: many of them command admiration from the splendour of their decorations and the articles of *virtù* which they contain; but perhaps the finest and most worthy of attention from the stranger are those of *Santa Agnese*, in the Piazza Navona, *San Carlo al Corso*, *San Ignazio*, the *Santi Apostoli*, the *Chiesa di Gesù*, and the *Chiesa Nuova*; all of which are abundantly rich in marbles, gilding, &c., though not always disposed in the best taste.

The Vatican, the most ancient and by far the most celebrated of the papal palaces, is a mass of buildings erected at various times by different popes, said to cover a space about 1,200 ft. in length by 1,000 ft. in breadth, and to comprise above 4,000 apartments. "The effect," however, says Burton, "is any thing but pleasing: from no point of view does it present any extent of front or magnificence of design; while its proximity to St. Peter's interferes most unfortunately with the view of that building." (ii. 255.) The interior consists of a suite of galleries of small breadth, which, if placed in a continuous line, would extend two miles in length. It contains a countless multitude of inscriptions, statues, busts, reliefs, urns, sarcophagi, and vases, to say nothing of its literary and numismatic treasures, its books, MSS., drawings, the number of which the visitor can only guess at by counting the presses that conceal them from his sight. Taken altogether, it is by far the richest museum in Europe, and the precious objects it contains are magnificently lodged; for when the church was rich, she patronised the arts liberally both by buying and building, and even now the posthumous benevolence of popes and cardinals occasionally expends itself in erecting a new gallery or embellishing an old one. (*MacLaren*, p. 174.) The collection of sculptures is beyond all comparison the largest and most valuable in Europe, comprising, among other great works, the unequalled group of Laocoon and his sons, which even Michael Angelo despaired of being able to restore, the celebrated Apollo Belvedere (found at Antium, near the close of the 18th century), the well-known group of the Nile and his offspring, the Belvedere Torso of Hercules and Hebe, a noble statue of Adonis, and another of Marcellus, with an excellent bust of Pius VII. by Canova. The library of the Vatican is alleged to comprise about 80,000 printed books and 25,000 MSS.; but, in point of fact, its literary riches are unknown, the

catalogues having never been completed. There is reason, however, to think that its collection of ecclesiastical MSS. immeasurably surpasses any other in Europe; but it is very deficient in works of modern literature; and its value can be fully appreciated only by the churchman and the antiquary. The picture-gallery, which is by no means extensive, is, as compared with the collections now noticed, quite of modern creation. The frescoes of Raphael and Michael Angelo, indeed, have long adorned the walls of the Vatican; and the works of the former occupy three open galleries, called the *Loggie di Raffaello*, which go round three sides of a square court; but the oil-paintings have been collected wholly by Pius VI. and subsequent pontiffs, including the present pope, to whom we are indebted for the completion of the gallery. It comprises several of the *grand* productions of the Italian schools, including among others the "Transfiguration," by Raphael, usually considered his *chef-d'œuvre*, and the noblest work of art in the world; the "Madonna di Foligno" by the same master, the "Communion of St. Girolamo" by Dominichino, the "Martyrdom of St. Sebastian," perhaps Titian's very best work, the "Madonna of Monte Luca" by Giulio Romano, &c. The Vatican has two chapels, the most celebrated of which, known as the Sistine Chapel, was built by order of pope Sixtus IV.; its walls and ceiling were covered during the pontificates of Julius II. and Paul III. with frescoes from the masterly hand of Michael Angelo. Behind the altar is the magnificent painting of the Last Judgment, the theme of so much eulogy and so much criticism; and on the ceiling are represented the Creation, the Deluge, and other scriptural subjects, the windows being adorned, somewhat inconsistently, with full-length figures of Prophets and Sibyls. It is a very large and lofty oblong room, with scarcely any of the furniture of a chapel: it is used on few occasions, except during the Holy week, when the *Tenebræ* and the "overwhelming" *Miserere* of Allegri are sung by the papal choir. In this chapel also the cardinals meet in conclave for the election of a new pope. The *Sala Regia*, a hall of great size and good proportions, connects the above-mentioned chapel with another dedicated to St. Paul, which, like the first, is painted in fresco by Michael Angelo, and used only on great festivals. The Vatican is now seldom inhabited by the pope, except during the grand festival of Easter, the present abode of the pontiffs being on the Quirinal Hill (now called Monte Cavallo, from the two horses on its summit, taken from the baths of Constantine). This palace, which was begun by Paul III., presents two long fronts, plain and unadorned, like those of most of the other palaces, the court within being upwards of 300 ft. in length by 165 ft. in width, three sides being surrounded by porticoes, and the fourth having a double row of arcades surmounted by a clock tower. The grand staircase on the side to the right of the gateway conducts to the papal apartments, the gallery, and the chapel, all of which are on a grand scale, and adorned with fine paintings, especially those by Guido, which ornament a small private chapel. The adjoining gardens are spacious, refreshed by several fountains, and shaded by groves of laurel, pine, ilex, and poplar; but little attention being paid to them, they have a shabby, neglected appearance, made only more apparent by their great size. In front of the palace stands an Egyptian obelisk, flanked on either side by the statues of the horses which, as already stated, give the hill its present name. The Lateran Palace, near the church of St. John Lateran, has three lofty fronts of great extent and simplicity: a few apartments are reserved for the pope, when he comes to perform service at St. John's; but the rest is used as an hospital for 250 orphans.

Among the public buildings of modern Rome, the *Campidoglio*, or modern capitol, deserves notice, as being one of the best architectural works of Michael Angelo. The road to it is by a labyrinth of narrow dirty streets, leading from the Corso to two flights of steps, at the foot of one of which are two basaltic lions. At the top are colossal equestrian statues of Castor and Pollux, on a line with which stand several other statues and trophies. Opposite the steps of the senator's palace, the two other sides being occupied by the Palazzo de Conservatori and the Museo Capitolino, the garden of which overhangs the Tarpelan rock,

"Steepest goal of treason's race,
The precipitous whence the traitor's leap
Cured all ambition."

But, owing to the accumulation of soil at the bottom, this leap might now be taken without any very extraordinary risk.

The ancient buildings, to be noticed in the sequel, are nearly all gone; but there are many statues, and one in particular, a bronze equestrian figure of M. Aurelius, occupying the centre of the Piazza del Campidoglio, demands attention, not only on account of its beauty, but its acknowledged antiquity. In fact, quite enough is still furnished both by Nature in the commanding position of

* The magnificent ode or sonnet of Zappi, inspired by the contemplation of this statue, may be seen, with a spirited translation, in *Roscoe's Life of Leo X.*, iv. 229., 3d edit.: it is also given with a different translation in *Burton's Rome*, ii. 234.

the hill, and by Art in the various architectural embellishments formed principally of ancient materials, to call up in the mind of the classical student those bye-gone days when decrees issued from the capitol fraught with the destinies of a subject world.

"Ages and realms are crowded in this space,
This mountain, whose obliterated plan
The pyramid of empires pinnacled.
Hither the kingdoms and the nations came
In suppliant crowds to learn their doom."
Childe Harold.

The Capitoline Museum comprises a few and not very valuable paintings by the old masters; but on the other hand, the collection of statues and marbles includes some of the most precious relics of ancient art, among which may be mentioned the "Dying Gladiator," the misnamed "Antinous," and the splendid group of "Cupid and Psyche." (*Conder's Italy*, iii. 347.; *Macclaren*, p. 160—162.) The only other government buildings requiring notice are the new post-office, in the Piazza Colonna, near the Corso, and the castle or citadel of St. Angelo: the central tower of the latter was built by Hadrian (thence called *Moles Hadriani*) for a mausoleum, and was unquestionably the most superb sepulchral monument ever raised in Rome. It began to be used as a fortress when the city was attacked by the Goths: its defences were strengthened by various pontiffs, the last and greatest improvement having been made by Urban VIII., who completed the fosses and bastions towards the meadows. It is now used as a state prison and house of correction, but is better known to foreigners as the place whence are discharged the magnificent fireworks of the Easter festival.

Rome, as previously seen, comprises a great number of palaces, with the general plan of which the reader is already acquainted; but a few deserve more particular notice. The *Colonna* palace, in the square of its own name, fronting the Corso, is entered by a noble painted staircase, leading to a gallery which, in point of size and architecture, is the finest in Rome: the roof of the saloon is supported by polished columns of *giacinto antico*, and the ceiling displays the battle of Lepanto, the event of which raised a Colonna to the honour of a Roman triumph. The collection of pictures, however, is about the worst of any in Rome. (*Williams's Letters*, ii. 80.) The *Borghese* palace is also a very splendid building, remarkable for its extent, its porticoes, its granite columns, and its long suite of apartments, being still more distinguished by the well-supported magnificence it pervades every part, and gives the whole mansion, on the ground-floor to the attic, an appearance of fitness, order, and opulence." These are the words of Stace; and, according to later writers, this palace is present equally well kept up. The collection, which, contrary to the usual rule, is on the ground-floor, comprises nine large rooms, and ranks among the first in the city. The *Doria* palace, in the Corso, has three vast halls, and comprises a spacious court, surrounded by colonnades: the gallery is particularly rich in paintings of the Italian and other schools, including many landscapes by Gaspar Poussin and Claude; in fact, nowhere in Rome is there so varied a collection, or one so well suited for the purposes of study. (*Rome in the 19th Century*, iii. 6—14.) The *Barberini* palace, one of the best buildings in modern Rome, built from the designs of Maderno, Bernini, and Borromini, consists of a projecting centre, surmounted by a square tower and two smaller wings; it comprises, also, statues and paintings, a noble library, freely open to the public. The *Farnese* palace, a structure, to erect which the Colosseum and the baths of Marcellus were despoiled of their choicest ornaments, had formerly a magnificent and, in some respects, unrivalled collection of ancient sculpture, painted books. But the king of the Two Sicilies having added to the rich inheritance of this illustrious family the collection has been carried to Naples. On the wing of a gallery belonging to the *Rospigliosi* in the Monte Cavallo, is the famous *Aurora*, the work of Guido, which the beautiful engraving by *Winkelman* must have made familiar to many of our readers. The *Capitoline* and *Corfini* palaces, and others too numerous to be mentioned, deserve attention for their architectural merits and the treasures of art with which they are furnished.

besides its palaces, has numerous *villas*, both old and without the present walls, built chiefly by a family, whose riches, taste, learning, and leisure, enabled them to create these beautiful retreats. The *Villa Pamphili* has already been mentioned as including the *St. Peter's* grounds that form the favourite resort of the Romans, and the mansion, with its collection of statues and marbles, is equally beautiful. The *Villa Ludovisi*, outside the Porta Salaria, is of exquisite beauty, and was purchased by Cardinal Albani, one of the prominent antiquaries of modern times: it was here that his patronage, Winkelman pursued those

studies that enabled him to write his history of ancient art. The collection, once far more extensive, is said to be extremely choice; in fact, it does not contain a single mediocre piece. The villas *Aldobrandini*, *Pamphili*, *Lenti*, and *Ludovisi*, are all, more or less, adorned with frescoes and ancient statuary; besides being well situated and surrounded with fine gardens. The magnificent *Medici villa*, on the Pincian hill, is now appropriated to the use of the French Academy.

The Tiber, including its windings, runs for three miles through Rome. The greatest breadth of the stream within the walls is only about 400 ft., and the smallest 200 ft., the average being somewhat less than one third the breadth of the Thames at London Bridge, and considerably less than that of the Clyde at Glasgow. It is deeper, however, than the Clyde, and has certainly a larger volume of water.

"Vorticibus rapidis et multa flavus arena
In mare prorumpit." *Virg. Æn. vii. 51.*

It well merits the epithet of *flavus*, as it is not only discoloured, but loaded with yellow mud beyond almost any other river; and this is not the consequence of accidental floods, for its waters are scarcely ever clear, and hence, no doubt, its ancient name *Albula*. Its banks are low and tame, consisting for the most part of crumbling soil, without quays, and at many places without even protecting walls; and they are not ornamented by a single promenade or decent street. (*Macclaren*, p. 150.) There are only two places where there is a sort of quay, or landing-place, one called *Ripetta*, on the E. bank, above the bridge of St. Angelo, where boats from the inland prov. land wine, provisions, &c., and the other at the S. end of the city, on the opposite bank, called the *Porto di Ripa Grande*, where sea-borne vessels land their cargoes, and where there is a line of warehouses, and a custom-house. Three bridges cross the river within Rome; that most northward is the *Ponte St. Angelo* (anc. *Pons Ælius*), built by Hadrian, and restored in its present form by Clement IX.: it is a structure of no great beauty, having a balustrade, on the top of which are several hideous-looking figures of angels. The next, proceeding southward, is the *Ponte Sisto* (anc. *Pons Janiculumensis*), built by either Trajan or Antoninus Pius, and rebuilt by Sixtus IV., in the 15th century. About half a mile lower down is the island of San Bartolomeo, the ancient *Insula Tiberina*, of oblong shape, about 1,000 ft. in length, and 300 ft. in breadth, united with the E. bank by the *Ponte San Bartolomeo* (anc. *Pons Cestius*), and with the W. bank and the district of Trastevere by the *Ponte di quattro Capi*, so called from a head of Janus Quadrifrons that formerly stood there; it is the *Pons Fabricius* of antiquity, and was constructed *anno 61, B.C.* Within Rome, also, are the remains of three ancient bridges, the principal being the *Pons Triumphalis*, so called from the circumstance of the triumphal processions crossing it on their way to the capitol: it is now entirely destroyed, but the piers of it may be distinguished by the agitation of the water a little below the bridge of St. Angelo. About half of the *Pons Palatinus*, the most ancient bridge of Rome, is still standing, a few yards below the island of San Bartolomeo, and a continuation has been made of wood for the accommodation of foot passengers. The *Pons Sublicius* or *Emilius*, the most southerly of the old Roman bridges, has long disappeared. The Tiber is now, as it was in Virgil's time, subject to very high and also frequent floods, the water sometimes rising as high as the Piazza di Spagna, and very frequently laying under water all the streets in the busy quarter near the river. On the *Porto di Ripetta* are two pillars which mark the height of the different floods for some centuries past; and it appears from it that they have all happened between the months of November and February. The frequency of these inundations gave rise to various projects for preventing them, and Aurelian caused the banks to be raised and its channel cleared, though with what success we are not informed. The vast accumulation of soil, however, by which the surface of modern Rome is raised so many feet above the ancient city, must, undoubtedly, make it less liable to suffer from floods now than formerly. (*Burton*, i. 296.)

The CLASSICAL MONUMENTS of Rome are very numerous, their interest depending on their beauty, grandeur, and singularity, their intrinsic merits, or on the events and personages historically associated with them. Those who expect gratification from the first source will, in many instances, be disappointed, as the greater number present little to please the eye or gratify the taste. The *aqueducts*, for example, those astonishing efforts of human industry, which stretch across the Campagna in various directions, exhibit their real greatness only to the understanding. To the eye, these works (of which there seem to have been 14, coming from 9 different sources,) present merely a series of naked brick arches, scarcely larger than a house-door in span, or higher than a park-wall, and without any sort of ornament. Near the

mountains, and in crossing valleys, they may be lofty; but in the vicinity of the city they are low and tame. Three only now remain in a state fit for use, viz. the *Aqua Vergine*, *Aqua Salvia* (near the *Colonna Traiana*), and the *Aqua Salaria*, which supplies the *Janiculum*. The Roman roads, also, skillfully built of large stones, may be called great works for their expense and utility, but they have no external attractions. The same remark applies to the *Claudia*, of which a fine idea is conveyed by sailing them across. They were rather drains made to carry off the stagnant water of the pontifical marshes, which occupied much of the low ground near the Tiber, and the spaces between the *Aventine*, *Palatine*, and *Capitoline* hills. They were constructed at a very early period (according to some, in the time of the kings), for the obvious reason, that the marshes separated the first inhabited parts of the city from each other and their distinction became indispensable. The height and width of the *Claudia* marshes, are equal, each measuring 144 ft. a view of it may be obtained at its mouth, where it flows into the Tiber a little below the *Pons Sublicus*, another portion being visible near the Arch of *Janus Quadrifrons*.

The baths, as they now exist, are an assemblage of naked, half-draped brick walls, which surprise by their huge size and the extent of ground they cover. We know of the former existence of eight thermæ, created by different emperors, and the remains of three remain in considerable masses, those of *Titus*, *Caracalla*, and *Diocletian*, the ruins of the first two of which are in vineyards, a great part of the last having been transformed by *Michael Angelo* into the church and monastery of *Santa Maria degli Angeli*. Bath consists of a labyrinth of apartments, the use of some of which antiquarians have scarcely been able to conjecture. *Caracalla's* baths covered an area of 35 English acres, a space nearly three times the size of *Lincoln's Inn Fields*, in London.

But we must keep in mind the multifarious nature of these establishments, which included not only baths, with their *caldaria*, *frigidaria*, *tepidaria*, &c., but peristyles and gardens, libraries, lecture and conversation rooms for the philosophers, academies and halls for declamation, gymnasia for the "lucy," theatres for the gay, temples for the devout, and, most probably, wine shops or places of refreshment for all; in fact, they were less baths than places of universal recreation. The Roman citizen left his home early and only returned at night to his bed, spending the day chiefly in the forum, the courts of justice, or at the baths. The latter establishments seem to have combined the uses of our coffee-house, smoking-room, library, lecture-room, and theatre, as well as baths. We may call them, indeed, national clubs, supplied with every species of amusement. It is this circumstance which gives them their interest. We cannot tread these ghastly chambers, where an armed mob fell on the one side the side of our own steps, without thinking of the estimated throng that once passed them, the crowd of Roman citizens of all grades and classes, from the emperor to the mendicant who received his monthly dole of wheat from the public granaries, the foreigners from every clime, priests, tax-gatherers, slaves, patricians, litigants, soldiers, parasites, who came to the seat of empire for business or pleasure. All these must have resorted to the baths, come for ab-

monitions to those who have deserved well of their country, and constituted to maintain the reputation of Italy.

The great wonder of ancient Rome, however, is the *Faustian amphitheatre*, now the *Colosseum*, or more properly *Coliseum*, unquestionably the most august relic in the world, and by far the largest amphitheatre of which we have any knowledge.

"*Great Circus only takes amphitheatre.*"

From the south from Imperial age, 18th century.

It consists of a vast ellipse, the length of the longest diameter measured from the outside of the outer wall being about 680 ft., and that of the shortest 415 ft., so that it covers about 45 English acres of ground. The largest diameter of the arena has been variously given as from 227 to 300 ft., and the shortest as from 165 to 190 ft., the space between the arena and the outer wall (from 245 to 167 ft.) being occupied by the walls, corridors, and seats that rose tier above tier from the wall round the arena nearly to the top of the outer wall. The latter which is about 170 ft. in height, consists of three rows of radial arches rising one above another, exclusive of which, it had, when perfect, upper works of wood. This colossal amphitheatre is said to have had seats for 57,000 spectators, and standing room for 20,000 more! There is truly, therefore, but little of exaggeration in the statement of *Adrian* that the amphitheatre

"*as its seats above occupied Rome.*"

And last, moreover, outside in its work.

The arena was sufficiently extensive for the exhibition, on the grandest possible scale, of the bloody sports that delighted the ancient Romans; and here hundreds, and even thousands, of gladiators and of wild beasts have frequently contended in vain.

"*Barbaric to make a Roman battle!*"

This magnificent relic has been much damaged by earthquakes, lightning, and the destroying influence of time; but it has suffered incomparably more from the injuries inflicted upon it by the successive masters of Rome. In the 13th century it was corrupted as a fortress, and in the course of the next century it became, what it long continued to be, a common quarry, whence materials were taken to build a large portion of the modern city (*Shakespeare's Illustrations of Childe Harold*, p. 255-256). In consequence of these lengthened devastations, "not a single step is now remaining of all the seats of stone which rose in regular succession from the arena, but the wall which surrounded it, to prevent the escape of the wild beasts, is nearly entire. The interior presents a most complete scene of destruction. By means of broken staircases, we may climb up a considerable height, and almost be lost in the labyrinth of ruins. It is from such a view of these remains that the best idea of their vastness is formed, and if viewed by moonlight, when the shattered fragments of stone, and the chains which grow upon them, are seen at a distance in alternations of light and shade, the mind receives mingled impressions of grandeur and melancholy which, perhaps, no other prospect in the world could produce." (*Baron's Rome*, 2. 14-15). At length, however, it was put to the question of this most splendid relic of Imperial Rome. "Bonaparte XIV. considered the spot which pervasion and battle had stained with the blood of so many Christian martyrs" (*Gibbon*, 21. 4th). And subsequent pontiffs have repaired and strengthened portions of the existing ruins.

The pile speaks powerfully to the imagination, through the bloody rim once adorned to it. It was the scene of those savage fights of gladiators, those combats of wild beasts which were unknown among other ancient nations, and have fixed a brand of infamy on the Roman name. The interior has been carefully cleared out, and the boundaries of the arena which was so often marked with blood are distinctly seen. When we stand among the broken arches of this vast edifice, now the shade of bats and owls, silent in the grove, and with not a single building near it, our thoughts are irresistibly carried back to the thousands of all ranks and both sexes who once filled its ample branches, to the roar and yell of the wild animals tearing each other, the shrieks of the slaughtered human beings, and the shouts of the blood-thirsty multitude now applauding the blow which took away a fellow-creature's life, and now calling out for fresh victims. These cruel exhibitions were characteristic of Rome, both republican and imperial. The Greeks, wherever they established their power, carried with them the elevated sentiments and graceful mirth of the stage, and you may trace the domination of the Romans over the ancient world, by the amphitheatre built

"*State of entire decay and ruinous state!*
"Imperial, yet perfect, with its circle of seats
"In ruins appearing to all eyes —
"To get a walk."

its beauty consists in its admirable proportions; and its surface, 110 ft. in length, by 64 ft. in depth, supported by 16 Corinthian columns of white marble, has a most majestic appearance. The portal is more than finished. It is particularly the most sublime result that was ever produced by so little architecture" (*Forster*). The dome is of great extent, and has a central aperture, from which the building receives its entire light. The *Faustian* has been stripped of every thing that could be taken away, in order to furnish materials for the embellishment of *St. Peter's*. It is now made the receptacle of

"*The amphitheatre of Pompeii and Vercelli, in the lower ages, were destroyed, or decayed, from the ruin of the building, and not, as has been supposed, decay, from a natural decay of stone, exposed to heat and cold.*" (*Baron's Illustrations of Rome*, 2. 14-15.)

for the gratification of their ferocity." (*Macaulay's Notes*, 116-1.)

The Romans, always fond of shows and games, were especially attached to those of the Circus.

— *Don't think our critics ought, From a Chronicle.*

JUVENAL, Sat. 10. v. 81.

There are said to have been at one time no fewer than 15 circuses in the city and its environs. The principal of which were the Circus Maximus, Circus Agonalis, and the circuses of Nero and Caracalla. Of the Circus Maximus (which Ausonius Marcellinus describes as being at once "the temple, the dwelling-house, the public meeting, and all the hopes of the ancient Romans"), there are now no remains; but Pliny informs us that it was capable of accommodating 250,000 spectators; and Juvenal, using, perhaps, a poet's licence, goes the length of saying,

"Totum hinc Romanæ Circus capit."

The form of the Circus Agonalis (supposed to have been built by the Emperor Severus) may be traced in the Piazza Navona; and even the round end is not lost: it is about 750 ft. in length; and the races held here during the Carnival forcibly remind us of the uses to which it was formerly devoted. The Circus of Caracalla, outside the gate of San Sebastian, has its walls still entire, though the seats have fallen in, leaving a kind of terrace along the whole length of the walls. It appears to have been 1,678 ft. in length, 435 ft. in width, and to have been capable of accommodating 20,000 spectators. Of the other Roman ruins (excepting those of the forum and capitol), the two columns of Trajan and Constantine, and the three triumphal arches of Titus, Constantine, and Severus, principally deserve attention, from their beauty and the taste displayed in their execution. The column of Trajan, erected to commemorate that emperor's successes in Dacia, is 115 ft. 10 in. in height, and including the statue of St. Peter, which Sixtus V. had the taste to substitute for that of its illustrious under. A spiral staircase leads to the balustrade at the top; and the exterior is adorned with sculptures in bas-relief, spirally arranged round the column, representing the victories and achievements of the emperor. Napoleon's pillar at Paris is a good imitation of that of Trajan. The pillar of Antonine (or, more correctly, of Aurelius, for he erected it), in the Piazza Colonna, is 115 ft. high, and is now surmounted by a colossal statue of St. Paul; the bas-reliefs, similarly arranged to those of the other column, are not nearly so well executed, and the whole is much injured and defaced. The Arch of Constantine, built to commemorate his victories over the Jews, consisting of a single arch, was adorned with eight noble columns of the Composite order, and had its interior covered with sculptures, representing the emperor's triumph after the capture of Jerusalem; but it is in a state of great dilapidation, many of its rich decorations having been carried off to embellish the Farnese and other palaces: latterly, however, some attempts have been made towards its restoration. Till the time of Sixtus V., the bas-reliefs were not visible, so much soil accumulated and buried the arch; but that pope ordered it to be excavated; and there is now a passage under it at the level of the ancient pavement, and, perhaps, on the pavement itself. The arch of Constantine, at the foot of the Palatine hill, near the Colosseum, is the most noble, because the best preserved structure of the kind in Rome; but it is inferior for its chief beauty to the spoliation of the arch of Trajan, which stood in the forum of that emperor, and the senate, with equal barbarism and servility, took of its *bas-reliefs* and other rich materials, and used them to ornament the new structure. It consists of a large arch between two of smaller size, having on each side 4 fluted Corinthian columns of giallo-antico, supporting the figures of 8 Dacian captive warriors. It is adorned with the bas-reliefs taken from the arch of Trajan, and with others of later date and of very inferior quality. The soil which had accumulated round this arch was excavated in 1804, when part of the *Via Trionfale* was brought to light. The grass-grown platform on top was once, probably, occupied by the victor's triumphal car; but this has disappeared. We may state, that the paltry gateway in front of the Vatican Palace is a wretched miniature imitation of the Arch of Constantine (*Leaves of the Ancient Rome*, 327).

The Capitoline Hill, "that rock of triumph, that high seat of Rome embraced her heroes," naturally exciting a feeling of enthusiasm; but of the topography of ancient Capitol we really know next to nothing. Four temples, 15 chapels, 3 altars, the great library, an athenaeum, an arena covered with trees, the enrolment-office, all these are to be seen in a space 400 yards in length, and 200 in breadth. Of these, the last only can with precision be traced to the double row of vaults crowded with the inscription of Cælius was discovered may be believed to have extended along the

pop. of Rome. The exaggerations of Voëtius, Lipsius, Châteaubriant, and others, who give to imperial Rome 14, 5, and 3 millions of inhab., are too absurd to deserve notice. Hume, who in his masterly *Essay on the Populosity of Ancient Nations*, has discussed the question of the pop. of Rome with his usual learning and good sense, arrives at the conclusion that Rome, when in the zenith of her greatness, might have been about as populous as London in 1760; in other words, that she might then have had from 700,000 to 800,000 inhab. Gibbon estimated the pop. at 1,200,000 (v. 286., 8vo. ed.); but it would appear that the more moderate estimate of Hume is the more accurate, though the probability be that even it is beyond the mark. It appears from the very learned and elaborate researches of M. Dureau de la Malle (*Economie Publique des Romains*, liv. ii. cap. 10.) that the area of Rome, included within the walls of Aurelian, which have been traced and laid down with the utmost precision, amounts to very near 1396½ hectares, that is to about 3-5ths the area of Paris: and the fair presumption is from the numerous forums and other open spaces in Rome, the number of the public buildings, and the great magnitude of many of the private residences, that its pop., as compared with that of Paris, would be in a still less proportion. To the pop. within the walls has, however, to be added that of the suburbs, the amount of which is the subject of elaborate inquiry by the same learned critic. On the whole, he concludes, apparently on good grounds, that the pop. of imperial Rome, including its suburbs, in its most flourishing period, may be fairly estimated, allowing for troops and strangers, at between 560,000 and 570,000 (l. 403.). And although we would not be understood as agreeing with M. Dureau de la Malle in all his statements, we have no doubt of their general accuracy, and of his estimate coming very near the mark. And, in fact, how small soever it may appear when contrasted with the statements that have been long current as to its vast magnitude, a pop. of 600,000 is really immense for a city like Rome, without either manufactures or trade, and the inhab. of which chiefly depended for subsistence on the gratuitous distribution of the corn supplied by the conquered provinces.

During the troubles that devastated Italy, and especially Rome, from the 5th to the 13th century, the pop. of the city rapidly declined, and did not exceed that of a third or fourth rate town of the present day. But from the 14th century it began again to increase; and in the "golden days" of Leo X., it is supposed to have amounted to about 85,000. Towards the middle of the 17th century it was estimated at 90,000. In 1709, the inhab. amounted to 138,568; in 1740, to 146,080; in 1765, to 161,899. (Gibbon, xii. 429.) But, owing to the influence of the French occupation, they had fallen off, in 1821, to 146,000, exclusive of Jews. It has, however, again increased; and at the last census, in 1836, it had 148,903 inhab. Owing partly to the unhealthiness of a portion of the town, and partly to the celibacy of large classes of the pop., the deaths uniformly exceed the births; so that were it not for the influx of inhab. from all parts of Italy, and indeed, of Europe, the pop. would rapidly decline. The decrease in 1837 was chiefly attributable to the ravages of the cholera.

The *inhabitants*, generally, are of a very mixed race; and it would be absurd to suppose, after so many changes, that they possess any considerable portion of ancient Roman blood. The men of the working and middling classes are generally stout and good-looking; though what are called Roman faces seem to be rarer than in England. The women, though good looking when young, soon become coarse; and, being large-boned, have a haggard appearance on losing their plumpness in old age. The men wear hats with crowns like a sugar-loaf, very wide cloaks wrapping round and round like a Scotch plaid; pieces of cloth tied about the legs with cords, instead of stockings, and sandals in lieu of shoes. The women generally wear a scarlet spencer with sleeves; and, for a head-dress, a piece of white linen, thickened on the crown by numerous folds, and with the end hanging down behind to the shoulders. Want of cleanliness is a common vice. The streets, public places, houses, and persons of the bulk of the pop., would all be improved by scrubbing, washing, and combing. Some of the most interesting objects are inaccessible from the accumulation of filth; and the appearance of the monks is absolutely disgusting; they are not redolent of holiness, but of dirt and vermin.

The cardinals and bishops being (under the pope) the rulers of the country, constitute the court-party, and claim the highest rank, after whom come the lay-nobility, subsisting on the revenues of their estates. The priesthood forms a very numerous portion of the inhab.; for, besides 37 cardinals and bishops, it appears, according to the census of 1836, that there were then in the city 3,490 priests and monks, besides 1,394 nuns. The civil nobility, with a few exceptions, are few in number, poor, and without power or influence. The lawyers, who are divided into 4 classes (correspond-

ing nearly with king's counsellors, barristers, attorneys, and notaries), form a pretty extensive section. After them rank the artists, a very numerous body, with a good deal of influence in society; and next to those are the *mercanti di Campagna*, a wealthy class, who farm extensively, and have warehouses at Rome for the sale of their produce. Rome has about 5,500 shops; but their owners, with some few exceptions, rank below the classes above described. The foreigners, a mixed multitude, among whom the English and Russians are the most numerous, and, generally speaking, the best informed, constitute a class of themselves; enjoying also, in consequence of their wealth, many peculiar privileges. The police exercises no inquisitorial powers; and foreigners may live as they please without attracting attention, and do, with impunity, what would not be permitted to natives. To this circumstance, as well as to the fascinations of antiquity and modern art, we may attribute the visits of foreigners; for, of the English at least, a large proportion are led by motives very different from a love either of the fine arts or classic lore. (Maclaren, p. 145.) With respect to morals, it is admitted on all hands that they are extremely lax. The common people are intelligent, and obliging, but passionate; and, on the slightest provocation, strike at each other with knives. Revenge and jealousy often lead, among the lower orders, to assassinations; rendered more frequent by the almost perfect impunity with which they may be committed. The statements as to conjugal infidelity are, perhaps, exaggerated; though the circumstances under which society is placed, the swarms of priests, monks, and others, having no excitement but that of intrigue, leave no doubt as to the prevalence of licentiousness, and the general corruption of morals. The modern Romans are prone to falsehood. "They never speak truth," says Mr. Maclaren, "at the expense of their own interest; and in the courts it is asserted that any quantity of false evidence may be got for money. Cheating, in all its forms, is practised by high and low; and provided it be cleverly done, and successful, they feel a pride in telling it. The judges and functionaries of all kinds have the reputation of being very corrupt. The higher classes are slaves to their vanity, and their indolent pleasures; the lower to the most abject superstition. This character, however, chiefly belongs to the past or passing generation. A large proportion of the young Romans in the middle and upper classes are described as liberal, gentlemanly, and honourable; but they, and indeed the educated classes generally of all ages, are Deists. They speak with contempt of the mummeries and pious frauds they daily witness, but go once a year to confession in order to avoid scandal. The Romans have, however, their redeeming qualities: they are very sober, social in their habits, fond of their children, and obliging to strangers. There is no town, perhaps, where foreigners feel so much at ease. They may dress as they please, live as they please, and indulge in all their personal tastes and eccentricities, without being annoyed, or even stared at. In private lodging-houses strangers often meet with much genuine and gratuitous kindness. Many of their vices may be ascribed to the operation of a bad political system on minds naturally acute and active; for falsehood, hypocrisy, and craft are the natural fruits of a government which crushes liberty of thought." (Maclaren's Notes, p. 82.)

The manners of the upper classes are indicative of extreme indolence. They rise late, and are never to be seen until four in the afternoon, when they take a drive up and down the Corso, which, narrow as it is, may be termed the Hyde Park of Rome; after which, they resort to *soirées* in private houses, for the theatres are open only during the carnival. To walk in Rome is quite unfashionable; and a carriage of some kind or other is quite indispensable, even to those of the noblesse or gentry whose limited income denies them a comfortable meal. Dancing, conversation, and cards are the chief evening amusements; dinner-parties are almost unknown, and suppers are only given on great occasions. In the month of May, all the inhabitants that can afford it, go to the country for 2 months, and again in October for the same period, the air of the Campagna being then purified by the rains of April and September. On these occasions, they hire a house or lodging in one of the petty towns 10 m. or 15 m. from Rome; and their principal amusement during their *villaggers* consists in fishing and bird-catching; the chase, in any of its noble forms, being little followed.

The public amusements consist of theatrical representations, concerts, and religious ceremonies, with occasional frolics at the carnival and other festive seasons. There are three theatres, two of which, the opera seria and opera buffa, are open during a great part of the year; but the performances are of a very mediocre description; the concerts have little to recommend them, and among the people at large, music forms but a small part of their enjoyment, though a few wandering harpers (*carciataieri*) may sometimes be found trying

this period being successful in war, added considerably to their previously confined territory. The public and private vices of Tarquinius Superbus led (*anno* 510 B. C.) to the abolition of kingly government, and the establishment of the republic, under 2 consuls, annually chosen, originally from the patricians only, but afterwards from either patricians or plebeians. The temporary ascendancy of the patrician party effected the institution (B. C. 500) of the dictatorship, by which, on extraordinary emergencies, the whole power of the state was committed to a single individual, who might act with despotical authority. In the sequel, after many delays, and much opposition, officers called tribunes were appointed by the people, who had a *veto* on the proceedings of the senate. The constitution was thus founded on the principle of a distribution of power between the aristocracy and the commonalty; and in this state it remained without any considerable change to the end of the Punic wars, the empire of Rome being in the meanwhile extended over Italy, Sicily, Corsica and Sardinia, the N. coast of Africa, and part of Spain. Amid these successes the distinction of patricians and plebeians seemed to have disappeared; but the unequal distribution of the public lands, or of those conquered by the arms of the republic, led to new, protracted, and bloody struggles between the patricians, who had appropriated to themselves the lion's share of these lands, and the plebeians, who sought to bring about their more equitable division. This occasioned the introduction by the latter of an AGRARIAN LAW; not, however, meaning by this, as is commonly understood, a law to interfere with or to effect an equal distribution of private property, but merely a law to limit the extent of the public lands held by individuals, and to subject them to a real and not a nominal rent. (*See Niebuhr, II. passim.*)

The history of the intestine troubles of Rome during the long protracted contests respecting this law, and the extension of the franchise to all Italian subjects and allies of Rome (the latter of which led to the Social War), would lead us into details quite unsuited to the nature of this work. It is sufficient here to state that the principle of representation not being adopted in the Roman constitution, it could not long survive, after the extension of the franchise to the Italians in general. The deliberations of the city assemblies were henceforth liable to be controlled by an influx of citizens from a distance, and full scope was given for the exercise of all sorts of corruption and intimidation. The soldiers, too, after they had carried their victorious arms beyond the boundaries of Italy, gradually ceased to pay their accustomed deference to the orders from Rome, and began to regard themselves rather as the servants of the generals by whom they were commanded, and to whom they looked for advancement, than of the republic. In consequence, the whole power of the state came to be engrossed by the great military leaders; and Marius and Sylla, Pompey and Cæsar, Marc Antony and Augustus, were successively masters of the Roman world. The battle of Actium (*anno* B. C. 30.) threw the whole power of the state into the hands of Augustus, and the public, weary with intestine wars and revolutions, were glad to enjoy tranquillity under his supremacy. The *imperator*, who had previously been merely the commander in chief, now began to concentrate all the powers of the state in his own person. He became, in effect, perpetual dictator, and held the sovereign power free from all constitutional responsibility. The senate, indeed, continued to exist under the emperors, and the prætors or judges retained their names; but the decrees of the former were recommended, or rather dictated, by the emperors, and the *edicts* of the latter were superseded by summary decrees called *constitutiones principum*. In this state the government of Rome remained about 400 years. The succession depended partly on the will of the reigning emperor, who sometimes appointed his successor, either by adoption, or by giving him the title of Cæsar. In the event of no successor being named by the previous emperor, the right of election devolved on the senate; but it was frequently usurped by the army and by the Prætorian guards; and sometimes rival emperors were chosen by the senate and the army, or by different armies, the pretensions of the candidates being decided in the field. Under such circumstances, and considering the degraded state of the Roman people, enervated by indolence, and corrupted by largesses, immunity from taxes, and indulgence in public shows, it may well excite surprise that the empire did not sooner fall to pieces.

Some speculative inquirers have classed the circumstance of the imperial dignity being elective among the causes that contributed to its decline; whereas it really appears to have been almost the only principle that enabled it to survive so long. In a government like that of Rome, where every thing had to be transacted directly by the emperor, a hereditary monarchy, which supposes the occurrence of minorities, was out of the question. And how unworthy soever the means by which

some of the emperors arrived at the imperial dignity, not a few of them owed it to their superior ability. Nerva, Trajan, the two Antonines, Severus, Aurelian, and other able princes, gave new vigour to the tottering fabric, and prolonged its existence.

At the close of the 4th century, the Roman dominions, which still extended from Britain on the W., to the Euphrates on the E., were divided between Honorius and Arcadius. At this time, too, the barbarians, sensible of the growing weakness of the Romans, began to harass the empire with incessant hostilities, and one country after another was lost, till at length Italy itself was invaded by the Huns, and shortly afterwards by the Heruli, whose general, Odoacer (A. D. 476), dethroned the impotent Romulus Augustulus, assumed the title of *rex*, and fixed his residence in Ravenna. Thus fell the greatest empire of the world, exactly 1,229 years after its supposed foundation by Romulus. Odoacer gave way to Theodoric, king of the Ostrogoths, and during his reign Rome and all Italy enjoyed a period of peace and prosperity. But the calm was only temporary; Belisarius, the general of Justinian, and Totila the Ostrogoth, successively took Rome, which was stripped of some of its most splendid monuments, at the same time that its inhabs. were reduced to a state of wretchedness which they had not before experienced. After having become a province, or *exarchate*, of the eastern empire, Rome passed, in 774, under the dominion of the Franks, who retained it till the deposition of Charles le Gros, in 887, after which the possession of Rome and Italy became, during more than three centuries, the subject of contention between the emperors of Germany, the numerous states into which Italy had been parcelled, and the bishops of Rome, who with the title of pope assumed a right to temporal power. Nicolas III. at length obtained from Rodolph of Hapsburg, in 1278, the grant of an independent territory, called the States of the Church; and thus began the sovereignty of the popes, which, with some interruptions, has continued to the present day. (Further details respecting this part of Roman history will be found under the head PAPAL STATES.)

ROMFORD, a market-town and par. of Essex, in the liberty of Havering-atte-Bower, on the high road from London to Norwich, 13 m. E.N.E. London, and 16 m. S. W. Chelmsford. Area of par., 3,240 acres. Pop., in 1831, 4,294. The town consists principally of a long wide street along the high road, having near its centre the market-house and town-hall, in which are held the petty sessions for the liberty. The church is an ancient structure, consisting of a nave, chancel, and N. aisle, with a tower at the W. end. The living is a curacy subordinate to that of Hornchurch, in the patronage of New College, Oxford, value 54*l.*, besides which the curate receives an annual stipend of 200*l.* (*Ecclesiast. Report.*) The Wesleyan Methodists and Baptists have their respective places of worship, with attached Sunday-schools: besides which there is a national school, partly endowed and partly supported by subscription. The town has also several almshouses and benefactions for the poor. At a little distance from Romford are cavalry barracks, erected in 1795, but now disused. The inhabs. are chiefly retail dealers or persons employed in market gardening and agriculture. The town derives, however, its principal advantage from its situation on the London road, and more recently from being one of the stations on the Eastern Counties Railway. It is also one of the polling places for the S. div. of Essex. Markets, especially for calves, well attended, on Mondays, Tuesdays, and Wednesdays; fair, June 24. for cattle and horses.

ROMNEY (NEW,) a cinque-port, decayed bor. market-town and par. of Kent, co. Kent, lathe Shepway, partly in lib. Romney-marsh, and partly in hund. St. Martin's Pountney, 19 m. S.W. Dover and 86 m. S.E. London. Area of bor. and par. 2,220 acres: pop. in 1831, 983. The town, which arose out of the ruins of Old Romney, was formerly in a comparatively flourishing condition, being a considerable sea-port; but the haven has for many years been completely filled up. It consists at present of a broad principal street crossed by one of inferior size, in which is the town-hall. Houses chiefly of brick, the market-house and town-hall being modern erections. The church is a spacious structure, consisting of a nave, aisles and chancel, partly Norman, and partly in the pointed style, with a large and curious tower at the W. end: the living is a vicarage in the patronage of All-souls' College, Oxford; of the nett value of 161*l.* a year. The Wesleyan-methodists have a small chapel, and there are 2 Sunday-schools, besides a free-school and almshouses. The inhabitants, with a few exceptions, are employed in grazing cattle on Romney-marsh, a rich tract of land, extending about 7 m. N and W. from the town, and comprising about 47,000 acres. This tract is defended from the encroachments of the sea by an immense embankment called Dymchurch-wall, along which is a good road for carriages: this sea-wall is kept in repair by a rate levied on the proprietors of the

ROSEY - RIMBY - about two market-towns, edge of England - Maine. Grand King's Bastion, he has being situated on the Yon, a tributary of the Andro, on the northern coast. S. N. W. South-east. Area of par. divided into Romney Marsh and vic. 5,200 acres. Pop. in 1861, 5,257. The town, high amidst rocks of a long and wide street, crossed by a right angle, covers a considerable extent of ground. It has an old house with a market-place square, and an old town-hall, in which petty sessions is held; but by far the most remarkable public building the par. church. The interesting edifice is almost the only remaining portion of an abbey said to have been dated here by Edward the Elder. The present structure appears, however, to date from the beginning of the 13th century, and it is one of the most complete Anglo-Saxon specimens in the kingdom. "It is a cross ch., with a low massive tower; the general character attracts to Norman, of very good proportion, and much enriched. The W. end is early English, very plain, etc., and no details communicated to the Norman; but the bulk of this W. portion is a very fine piece of the early English, rich rather by composition, diffuse ornament. The central portion and the apse, with the choir of the church, are Norman, the various sculptures and masters of polished classic forms. (Anderson, *Arch. Arch.*, p. 170.) Church has a fine high altar, much good tracery, of glass, &c. and a curious peculiarity is, that a Dutch-burning apple tree grows from its roof. The vicarage is in the gift of the dean and chapter of Exeter, to worth £100 a year. The Parsonage is a small house in Romney, and it has an altar, a charity school for 50 boys, a free school, the corporation are trustees for several charities which, its affairs of the par. generally appear to have well managed. (Mss. Corp. Appendix.) The cur. consists of a mayor, 6 aldermen, and 20 capital etc.

the importance of Rumney is derived from its
ing goods by retail to a large agricultural district
and is increasing in pop., but the trade is de-
g. Formerly, many extensive manufacturers of
and other articles were carried on in Rumney,
there is abundant and excellent water-power,
introduction of steam has greatly diminished the
Rumney" (Athenaeum Correspondent).

William Perry, one of the most extraordinary men
in the business of a clothier. He received his
education in the grammar school of his native
land after his death, on the 11th December 1887,
his name was deposited in the par church under a
an inscription with his name.

*A, a city of Spain, in Andalusia, prov. Granada, 1,440 ft. above sea level, 100 m. S. by N. Malaga, and 10 m. Gibraltar. Pop., according to Malaga, 16,600. It is peculiar, being built on lofty rocks upon the river, across which, in an direction of 225 ft. gardens, are three or four bridges, one of which is a single arch, 100 ft. span, and ornamented with bridges of these arches, at a north position.

A third bridge spans the stream somewhat lower. The view is wholly unobscured and makes one marvel at the city. One part of the Old City, overhangs the stream and is

enclosed by an old walled wall, built by the Germans, and flanked by extensive networks. With the more widely spread buildings on the opposite bank have the name of St. Bernardine or New York. Within the city (Bismarck) stands the royal palace of Adam-Bismarck, the floor were a vast heap of ruins. The only entrance to the city is through a succession of gates, leading to a long and narrow but tolerably straight street, running N. and S. for about 1/2 m. to the upper or new bridge. This street is flanked on both sides (and also from the end off both right and left) : situated with hills, woods on which however are found still in the city. One house, " St. of Bismarck, the noteworthy line of the province, was, proved : was by the records of their first Bismarck, would as now think of the page as of taking up the entire inhabitants of the north

...is, beyond all comparison, the most agreeable place of residence." (*Ante's House and Grounds*, 1768, 116.)

Along the way, the studies of the *Real Monasterio* (of corporations of nobility for breeding horses), and the *Plano de las Puercas* a dramatic account of the life of one of the harem-brothers in Spain, and capsule of commentary on 18th century.

The inhabitants of Banda are principally employed in agriculture and horticultural pursuits, though there are several manufactures of coarse cotton cloths, and hats, &c or three tanneries, and common water mills. It is a place, also, of considerable commerce. Its situation, and, at the same time, central position, making it a convenient depot for on-going goods to which is added, the great trade of Spice country commerce. A very large fair is annually held here to buy for cattle, horses, sheep, and general goods. It affords an extraordinary opportunity of people from all parts of the country, and offers an excellent opportunity for observing the customs and shades of character peculiar to the islands of the different provinces. The society of Banda is particularly good, consisting of some of the most prudent and sensible families who, with all the polish of the first circles, are exempted from the demoralizing vices which distinguish the dissipated habits of Malacca and other large cities. On the whole, continues Captain Smyth,

I certainly know a place where a few weeks can be more agreeably spent. (118) The climate of Florida, clim. is very delightful, catches everybody but our diaphanous cold and is to be considered as favourable to longevity, that it has become a common saying, — the Florida has hundreds of naturalists who are persuaded that Florida even now at night are abundant.

The neighborhood is not only extremely picturesque, but produces an abundance of wine, oil and corn, as well as the fruits and vegetable products of a more N. climate. I saw grass in large beds on the plain, and the hills covered with many varieties of grains including corn and wild hemp. About 3 m. S. E. of Acate is the singular mountain called *Cerro de Galla* consisting of two parallel ridges joined at the bottom, one red, the other white, both of them present marked ridges which, under a better system of cultural management, might possibly be turned to good account.

Unsettled has been suggested, though, perhaps, with little

00000000000000000000

feed in this, as well as in other Highland coes. At no very distant period, cows were extensively employed in field-labour; but they are no longer used for this purpose. All sorts of improvements, both in breeding and cropping, have been tried by the principal proprietors, and by many intelligent and enterprising sheep farmers that have immigrated thither from the S. Most part of Easter-Ross, great part of the Black Isle, with the country round Dingwall, and along the N.W. shore of the Inner Frith of Comarty, now ranks with the finest districts of Scotland. It is traversed in every direction by excellent roads, is well fenced, and has a more than usual number of seats and plantations. Agriculture has been wonderfully improved; and the crops of wheat and turnips are at present nowhere inferior to those in the mere S. coe. But exclusive of these districts, a great extent of mountainous country is still occupied by the old Highland tenantry. These are a brave and hardy set; but poor, and without either enterprise or industry. They occupy the straths or valleys between the mountains, and along the banks of the rivers, which in some places are so thickly tenanted, that there is a family on every Scotch acre of arable land! On this they raise oats, bear, or bair (a species of barley), and potatoes; frequently cultivating the ground with a crooked spade (aschren) instead of a plough. The mode of ploughing, which was formerly general over the whole country, and which is still practised by the smaller tenants, is barbarous in the extreme. The smaller tenants uniformly possess a considerable extent of grazing ground, which is commonly contiguous to, but sometimes at a considerable distance from, their arable possession. Their huts are for the most part wretched; few of them have either chimneys or windows; they prefer, indeed, living in the midst of smoke and filth; and in winter, the cattle are generally housed under the same roof with the family. Except for a few months, when sowing or reaping their crops, preparing and saving fuel, &c., the greater part of their time is spent in the pursuit of game, in fishing, or in idleness. Previously to the reduction of the duties on whiskey, illicit distillation was very prevalent, and is still led on, though to a comparatively small extent. "It is to be said with truth that the class of people of which the great majority of the pop. consists enjoy the fruits of life in even a moderate degree. Poorly fed, sly clothed, and miserably lodged, there is a life-nurture and toll; exposed to the temptations of idleness without its ease, and to the slavery of labour,

worth 1,394l. a year, net income. There is a market-house, two charity schools, and an almshouse. In Camden's time Ross was celebrated for its cutlery and its cyder; the former, however, has entirely disappeared, but it continues to be distinguished by the excellence of the cyder made in its vicinity. It is governed by a surgeon and four constables. Market on Thursday.

The
were buried, not in coffins, but in complete suits of armor. This circumstance has been alluded to by Scott, in his fine ballad of "Rosalind," in the "Lay of the Last Minstrel."

The glen in which the Esk runs from Roslin to Laswade is mostly narrow; has in parts high, precipitous, rocky, and well-wooded banks, and is celebrated for its romantic scenery. A little below Roslin, on the opposite side of the river, is Hawthornden, the seat of Drummond, the contemporary and friend of Ben Jonson, and one of the best poets of his age. The house stands on the brink of a precipice, overhanging the river, and, with the estate, is now in the possession of the descendants of the poet. Below the house are extensive caves, or apartments cut in the sandstone rock.

Roslin is much resorted to in summer by parties from Edinburgh; and most strangers who visit the latter, contrive also to visit Roslin. (*Pennant's Scotland*, iii. 264. ed. 1790; *Chambers's Geog. of Scotland*, &c.)

ROSSBACH, a village of Prussian Saxony, 16 m. S. Halle, celebrated in modern history for its being the scene of the great victory gained on the 31st of November, 1757, by Frederick the Great, with little loss to his own forces, over the French and Imperialists.

ROSTOCK, a commercial city and sea-port of N. Germany, being the largest town, though not the cap. of the grand duchy of Mecklenburg-Schwerin, on the Warnow, 9 m. above its mouth in the Baltic, and 40 m. N.E. Schwerin; lat. 54° N., long. 12° 12' E. Pop., in 1845 30,305. It is surrounded with old walls, and divided into 3 parts; the old, middle, and new town. It has several suburbs, which, with the city, are built in an old-fashioned style. It has been frequently the residence of the grand dukes, and has a ducal palace, numerous churches, a convent, 3 hospitals, a town-hall, theatre, &c. The church of St. Mary's is interesting from its having a monument in honour of Grothius, the illustrious author of the treatise *De Jure Belli et Pacis*, one of the greatest men of modern times, who expired here on the 28th of August, 1645, far from his family and friends, an exile from his ungrateful country. In one of the squares, thence called *Blucher's Platz*, is a statue of the celebrated Prussian general, Blucher, who was a native of the town. The university of Rostock, one of the oldest in Germany, was founded in 1419. It has 4 professors of theology, 5 of jurisprudence, 5 of medicine, and 10 of philosophy; besides 3 extraordinary professors, and 10 private teachers, having attached to it a library of 45,000 printed vols., theological and other auxiliary schools, an anatomical theatre, laboratory, botanic garden, and various scientific collections. It is, however, but poorly attended, having, in 1835, only 86 pupils. Rostock has a society of natural history, and other learned associations, and a

79 were males, and 41,908 females. Valued at 5l. Scotch; annual value of real property, in 5l.

1 town and par. of England, co. Hereford, tree, on the Wye, 15 m. W. by S. Gloucester. 2,840 acres. Pop. of do., in 1841, 2,773, of bor. had about 1,500. The latter is solely an eminence above the river; but its streets ough, and narrow. The church, in a con- 2 sation, has a lofty spire, and is partly in the 3 r style; but, according to Kitchman, it has 4 by alterations and repairs. The living, a 5 vicarage, vested in the patronage of the 6 Hereford, is one of the best in the co., being

every other Dutch town, is intersected by numerous canals, only one public thoroughfare, the High Street, being without a canal in its centre. This street, which runs in a direct line E. and W. through the city, is somewhat raised above the rest, being built upon the dam by which the Maas is prevented from inundating the country behind the town. Being the principal seat of retail commerce, it is lined with shops throughout. Rotterdam has a striking appearance from the river.

The fine quay, called the *Boompjes*, from the rows of trees with which it is planted, extends along the river for nearly a mile: behind the trees is a line of well-built houses four or five stories in height, mostly of dark-coloured brick, and having an aspect of much grandeur. The quay being crowded with shipping, this part of the city is the great seat of business, and presents a scene of incessant activity. "In penetrating through the town from the Boompjes, we come to street after street, each having a canal in the middle, lined with trees on both sides, and exhibiting a mixture of lofty gable fronts of houses, masts, and masts of shipping. The canals, or havens, stretch lengthwise and crosswise, like the meshes of a net, through the city; and at every short interval is perceived a drawbridge of white painted wood, constructed with ponderous balancing beams overhead, and raised by means of chains, for the passage of vessels. The ground beneath the trees is paved with small yellow bricks, and is chiefly occupied as quays for the landing of goods. The space from the trees to near the houses is paved in the usual coarse manner for carts and carriages, and here the foot passengers are generally obliged to walk, for small outshot buildings, flights of steps, doorways, and such like interruptions prevent any regular thoroughfare on the narrow brick trottoirs close to the houses. The havens are in a few places protected by chains from the streets, so that there is a constant liability to accidents, particularly at night, when darkness is but poorly relieved by oil lamps dangling, in an old-fashioned manner, from the ropes stretched betwixt the trees and the houses. Latterly a portion of Rotterdam has been lighted with gas; but according to a parsimonious plan, the lamps are not lighted when the moon is expected to shine." (*Chambers's Tour*, p. 5, 6.)

The houses of Rotterdam are generally on a large scale, and lofty; in many of the streets they are really magnificent. Mr. Chambers speaks as follows of a large residence. "Each house may be considered the residence of a merchant, who both resides with his family, carries on the whole of his commercial transactions from the same set of premises. The front part of the house exhibits an elegant door of lofty proportions, 20 ft. high for instance, at the head of a flight of stairs."

On getting a glimpse into the interior, you see a hall paved with pure white marble, and a stair of the material leading to the story above, which contains a suite of lofty rooms, and is the main place of business of the family.

One of the rooms are finished in a style of great elegance, with rich figured cornices and roofs, silk draperies, windows, smooth oak floors, and the walls most artistically painted as an entire picture or landscape, in oil, by a master of eminence. Near to the door of the house is a small hall, which, on being thrown open, discloses a wide paved thoroughfare leading to an inner court, the buildings round which are devoted to the whole warehousing department of the house. The bulk of the edifices of this great trading city is of the kind I describe." The ordinary houses are generally heated, and are in other respects not very comfortable; but the poorest house in the city is as clean and bright, and washing can make it, both inside and out, in this respect, indeed, the Dutch have no equals. The minor peculiarities which strike an Englishman are the small mirrors affixed outside to almost all the floor windows, which are placed so as to show the street whatever may be going on in the street. The want of good potable water is a great inconvenience.

Rotterdam has few public buildings of interest. The town hall, a large modern structure in the Grecian style, with a council-room, with rooms for the city library, and a magnificent optical apparatus; but, though superior to the ordinary edifices, it is much inferior to that of Amsterdam. The exchange, on the contrary, is a finer building than that of the capital; it is rectangular, with a central tower, surrounded with arcades, supported by 10 pillars, each of a single block. The Schiedamschedijk, occupied in 1811 by Napoleon and Maria Louisa, perhaps the finest of the public edifices. The new and the former East India House on the present nothing remarkable. There are from 10 to 12 churches, including one for English Episcopalians, one for Scotch Presbyterians. The principal church of St. Laurence, formerly the R. Cath. It is a large Gothic brick building, with a tall tower, and dates as far back as 1412; but the ancient ornaments were swept away at the

Reformation. In it are the monuments of the celebrated Dutch admirals, De Witt, Kortnaer, and Brakel, each of which has an appropriate inscription. It has also a splendid organ, said to be superior in size to the great organ of Haarlem, generally considered the largest in Europe. This is 150 ft. in height, mounted upon a colonnade about 50 ft. in elevation, and has, according to Barrow, 5,500 pipes, the largest being 32 ft. in height, and 16 in. in diameter. In the market-place is a bronze statue of Erasmus, the most illustrious by far of the natives of Rotterdam. The house where this great scholar, "the glory of the priesthood and the shame," first saw the light, on the 28th Oct., 1467, still exists; but (*quantum valet!*) it has been degraded into a gin-shop! Rotterdam has a naval dock-yard; but it is on a small scale, and contains little worth notice. In the neighbourhood of the city are many places of entertainment, as tea-gardens, &c.; and in the town are several clubs, where English as well as continental newspapers are taken in. Rotterdam is the seat of the marine department for the Maas, of the superior judicial courts for the prov., and of a tribunal of commerce; the cap. of the 9th militia district of the kingdom; and the residence of a military commandant, a director of police, and numerous foreign consuls. It has a society of arts and experimental philosophy, founded in 1767, branches of the Societies of Public Good and the Fine Arts, a college, a Latin school; many superior intermediate and poor schools, in the whole of which, according to Chambers, about 8,000 children are instructed; and various private academies. The central prison of Holland for juvenile offenders is at Rotterdam; it has also various workhouses and charitable institutions, and a savings' bank, paying interest at 4 per cent. There are manufactures of tobacco, refined sugar, needles, and pins, glass wares, corks, dyeing and chemical products, spirits, &c.; large markets are also held weekly for corn, flax, hemp, and other agricultural produce; and the annual fair of Rotterdam is the largest in Holland. (*De Cloet*.) Rotterdam is more advantageously situated in a commercial point of view than Amsterdam, or any other Dutch town. She is easily accessible from sea by the largest class of merchantmen; and from her position on the principal embouchure of the Rhine, as well as of the Maase, she is the grand emporium of the foreign trade of the countries which they traverse. The imports and exports are similar to those of Amsterdam, which see. The white Zealand and Rhenish wheat shipped here is of a superior quality; and it is the best market for madder, Geneva, cheese, &c. The imports, in 1840, comprised, among other things, 20,115 tons coffee; 20,067 tons sugar; and 5,082 chests indigo, mostly from Java; with 15,206 bales cotton, 17,411 hhds. tobacco, 21,012 slabs Banca tin, &c. During the same year there entered the port 1,671 ships of the burden of 329,584 tons. Rotterdam has a regular intercourse by means of steam-packets with London and other great over-sea ports, and with Düsseldorf, Cologne, Maestricht, and other ports on the Rhine, Maase, &c. The railway from Amsterdam to Haarlem is to be extended to Rotterdam.

Besides Erasmus, the great painter Adrian Vander Werf, was a native of Rotterdam.

ROUBAIX, a manufacturing town of France, dép. du Nord, arrond. Lille, cap. canton, on the canal of Roubaix, 7 m. N. E. Lille. Pop., in 1846, inc. comm., 22,142. Like most Flemish towns, it is well built. It formerly laboured under a want of water; but of late an adequate supply has been obtained by means of Artesian wells. After Lille, Roubaix is one of the chief towns in the dép. for the manufacture of cotton goods; it has been estimated that, in the town, and immediately adjacent country, about 30,000 hands are alternately employed in the manufacture of cotton and woollen goods; the latter from about June to September, and the former during the remainder of the year. Mr. Symonds says, "of the various weaving and spinning districts of this manufacturing dép., there is none more prosperous than Roubaix, which has increased prodigiously within the last 10 or 15 years. The articles chiefly manufactured are Thibets, waistcoat-pieces, and thick cotton goods. There are about 12,000 looms in this district, of which half are Jacquard looms. The latter are principally in the factories, the manufacturers finding it necessary to preserve the privacy of their patterns. A weaver will, on the cotton goods, earn at an average 20 sous (15d.) a day; on the second class work, from 20 to 40 sous (15d. to 20d.); and on the Jacquard loom, from 2 fr. to 5 fr. per day, the average being about 3 fr.: these are gross wages. Nett earnings will be, weekly, about 12 fr. or 13 fr. for the Jacquard weaver, and from 6 fr. to 10 fr. for the plain weavers. Women and children obtain plenty of employment at the mills. Wages had risen by above 15d. in the last few years. I inspected a woollen spinning factory: the spinners were earning from 20 fr. to 24 fr. per week nett, as a matter of course; and it is by no means uncommon for them to earn 30 fr. nett. The girls earned about 7 fr. 30 cents, and the children 3 fr. per week. The rooms were all high, clean, and well

ventilated; and the machinery, built by an engineer at Rheims, though not of the newest description, was extremely good. The yarn spun was fine and even, and superior to what I have sometimes seen in Scottish mills. (*Handloom Weaver's Rep.*, pp. 129, 130.) The working pop. of Roubaix is increasing by continual immigrations from Belgium. Some of the labourers live in the town; but the greater number reside in the neighbouring villages and hamlets, coming daily to and from the factories, in which they work from 14 to 15 hours a day. They live mostly on meat, soup, potatoes, and beer; using butchers' meat 4 days a week. Symons says, that the morals of the working classes here are decidedly worse than in most other districts; but, according to Villermé, who, in this respect, is a better authority, the work-people of Roubaix and Turcoing are, whether as regards morals, cleanliness, clothing, lodging, food, or health, decidedly superior to those of Lisle. Drunkenness is here, and, indeed, every where else throughout French Flanders, a prevalent vice; but, in other respects, the conduct of the work-people seems to be good; and they have established numerous societies for their mutual support and assistance. (*Villermé; Tableau des Ouvriers; Hugo; Dict. Géog.*)

ROUEN (an. *Rothomagus*), one of the principal cities of France, and the great seat of its cotton manufacture, dep. Seine-Inférieure, of which it is the cap., on the Seine, 44 m. (direct distance) from its mouth, and 67 m. N.W. Paris; lat. $49^{\circ} 26' 27''$ N., long. $1^{\circ} 5' 50''$ E. Pop. in 1846, 91,046; but if the inhabs. of all its suburbs be included, the pop. will amount to upwards of 100,000. (*Villermé, &c.*) This city, which stands in a fine and fruitful country, is most admirably situated on a navigable river, by which it communicates with the cap. on the one hand, and with the flourishing sea-port of Havre on the other; and it is surrounded by a verdant and delightful country. Its numerous spires and towers, and the vessels that throng its quays, give it a very imposing external appearance, to which its interior presents in most parts a striking contrast. Generally it is ill built. Streets mostly narrow, crooked, and filthy; houses principally of wood, or rather of lathe and plaster, though in the W. and newer quarters of the city some are built of more solid materials, and have even considerable elegance. It is oval, or rather lozenge-shaped, and was for a lengthened period pretty strongly fortified; but its ramparts are now demolished, and their place is occupied by a series of boulevards, which separate the city proper from the *faubourgs* Cauchois, Bouvreuil, Beauvoisine, Martinville, &c.

The Seine, here crossed by a bridge of boats, and one of stone, divides it from its large suburb of St. Sever. The boulevards, which are planted with trees, like those of Paris, and the fine broad quays and *cours*, which extend along the banks of the river, are the favourite and almost the only public promenades; the squares or open spaces are shabby and irregular, and except the *Place Royale*, near the centre of the city, are all of insignificant size. Some, however, are ornamented with public fountains, with which Rouen is well furnished: the *Fontaine de Lisieux* is a curious piece of antique sculpture, representing Mount Parnassus, with figures of Apollo, Pegasus, &c. In the square of La Pucelle, an indifferent statue of Joan of Arc is erected on the spot where that heroine suffered martyrdom in 1431.

The central parts of the city are the chief seat of general commerce; the upper classes principally reside in the faub. Cauchois, and the N. suburbs; while the lower quarters at the E. end of the town, and the faub. St. Sever, are almost wholly inhabited by the manufacturing classes.

By far the most celebrated and striking public edifice is the cathedral, one of the noblest religious structures in France, or even in Europe. It was constructed principally between the 12th and 16th centuries inclusive: entire length, 434 ft.; breadth, 103 ft.; length of transepts, 174 ft.; height of nave, 89½ ft.* Its richly ornamented front has three fine portals, over the central of which is a square tower, and spire of iron work, reaching to a height of 464½ ft.; flanked by two lofty but dissimilar towers, the *Tours Romane* and *Georges d'Amboise*. The former, which dates from a period long anterior to the rest of the building, is in a simple and unadorned style; but the latter, built at the end of the 16th century, is much admired for the beauty of its architecture. It is ornamented with numerous sculptures; and before the Revolution contained an enormous bell, which, with many others belonging to this cathedral, was then sent to the cannon foundry. The interior of the edifice is lighted by 130 windows, many of which are ornamented with stained glass; and contains a vast number of tombs, including that of Richard I. (*Cœur de Lion*) of England, many dukes of Normandy, and 17 archbishops of Rouen; and the fine mausoleum of the

* The dimensions are given by Hugo, and the *Guide du Voyageur*, in French ft., which are here converted into English feet.

two cardinals d'Amboise. The latter is very perfect; but many of the other monuments were much mutilated in the religious and revolutionary wars.

The church of St. Ouen in the *Place-Royale* belonged to the oldest conventual establishment in Normandy, and occupies a larger extent of ground than the cathedral. It is an admirable specimen of the pointed Gothic: its fine octagonal tower rising from the centre of the building, is 265 ft. in height. The town-hall adjoining this church was originally a portion of the conventual edifice; and, besides various public offices, is appropriated to the museum and public library, with about 80,000 volumes. Several of the other churches in Rouen well deserve notice, and some are of high antiquity. The great city clock is placed in a square Gothic tower, erected in 1830, in the High Street. The *Palais de Justice*, with a noble saloon, was built for the parl. of Normandy, at the end of the 15th century. The mercantile halls of Rouen, for the exhibition and sale of different articles, are well adapted to their destination. They occupy three sides of a square, the centre of which forms an open exchange. A special apartment is devoted to every different kind of goods; the cotton-cloth hall, where the most important branch of traffic is conducted, is 290 ft. in length, by 53 ft. 4 in. in breadth. Every Friday, from 6 A.M. till noon, these halls display great commercial activity. There is another exchange adjacent to the quay. The exchequer-office, *chambre des comptes*, barracks, the *bicêtre*, a spacious general prison, another prison for accused but untried persons, prefecture, archbishop's palace, mint, custom-house, college, 2 theatres, *Asi-dieu*, the general infirmary, which, according to Hugo, has commonly 2,000 inmates, Protestant church, and the remains of an old fortress, are among the other principal public buildings. Rouen has some private houses worth notice, especially those in which Fontenelle and Pierre Corneille were born; others in which are some curious works of art, &c. It is the seat of a royal court for the depts. Seine-Inf. and Eure; of tribunals of primary jurisdiction and commerce; a chamber of commerce, and council *des prud'hommes*, royal and university academies, a royal college, and a mint established in the 9th century; the cap. of the 15th military division of France; the seat of an archbishop, whose diocese comprises the dep. Seine-Inférieure, and whose suffragans are the bishops of Bayeux, Coutances, Evreux, and Séez; the seat of a Protestant consistory; and the residence of many foreign consuls. It has a central society of agriculture; societies of public emulation, commerce, agriculture, medicine, &c.; a Bible society; schools of design and navigation; a botanic garden; savings' bank, and various charitable institutions.

Rouen is so eminent for its cotton manufactures that it has acquired the title of the French Manchester, and checked printed cotton cloths for women's dresses, are commonly known in France by the name of *rouenneries*. It was anciently celebrated for its linen fabrics, the manufacture and dyeing of which appear to have been carried on in it in the earliest times of the French monarchy. But so late as the middle of the last century, the workmen employed at Rouen were nearly all foreigners, Germans, Dutch, or Swiss; who remained in France only during a part of the year, returning to spend the remaining months in their native countries: and less than 50 years ago, the cotton yarn employed in the manufactures was wholly spun by hand. At present, however, both water and steam power are largely employed. The whole region round Rouen shares more or less in its branches of manufacture. Mr. Symons says there are 930 spinning mills in Normandy and the Seine, and 920,000 spindles. (*Handloom Weavers' Report*.) The prefect of the Seine-Inférieure, in 1835, estimated the weavers of cotton and woollen goods in that dep. to amount to about 120,000, 4-5ths of whom were resident in Rouen and its immediate neighbourhood; and Villermé (1840) states that 80,000 persons, men, women, and children, or about half the entire pop. of the city and suburbs, are engaged in the cotton manufacture. (*Tableau des Ouvriers*, i. 128-9.)

"The manufacturers of Rouen (says Mr. Symons) pride themselves greatly on the superiority of their products; and it is but justice to say that I have seldom seen printed cottons so good in colour and texture at 7d. per ell, as those of Rouen at that price. The goods produced by the Norman looms are in direct competition in third markets with those from the W. of Scotland. The wages of Norman weavers are, if any thing, lower than in Scotland, but provisions are at least 20 per cent. cheaper. So that no great difference is perceptible in the condition of the two classes; and were I to be forced to choose whether I would be a pullicate weaver in Scotland or in Normandy, I think I should be sorely puzzled which to select, or rather which to consider the greater infliction." (*Handloom Rep.* p. 125.) The nett wages obtained by country weavers working on their own account on pullicates, thick calicoes, &c., are about 1 fr. a day, or 5s. a week,

and this may be taken as above, rather than below, the average. Children and women are both occupied in weaving at proportionate earnings. In the spinning mills, spinners get from 15 to 20 fr. a week, working from 80 to 84 hours; women and girls employed at the carding and drawing operations gain from 7 fr. to 10 fr. The power-loom weavers earn from 12 to 16 fr., and day labourers from 10 to 12 fr. a week. (*Hand-loom Rep.*)

In some branches, and especially that of spinning, wages diminished during the ten years preceding 1834; since which they have been somewhat augmented. According to Villermé, the working classes of Rouen are, upon the whole, in a much less depressed condition than those of Lille, and their health is also much better. Drunkenness is in both towns the prevailing vice among the lower classes; but it seems to be less prevalent at Rouen. The woollen manufactures of the city are unimportant; their chief seat in this dep. being at Elbeuf (which see). Broad silks, velvets, hardware, superior earthenware, chemical products, and confectionary, for which Rouen is famous, are the other principal products. Vessels of 60 tons ascend to the city, which carries on a considerable trade with the countries both in the N. and S. of Europe, the Levant, America, and the other maritime depts. of France; the greater part, however, of its foreign commerce is carried on through the intervention of Havre. Rouen was of sufficient importance in the third century to be created a bishop's see; it afterwards became successively the cap. of the kingdom of Neustria, and of a duchy of Normandy. Prince Arthur of Brittany was put to death in Rouen, in 1202, by John of England. Philip Augustus besieged and took the city in the year following. It was retaken by Henry V. of England in 1417, and retained by the English till 1449, when it was finally annexed to the French crown. The reformation made great progress here; and the city owed much in consequence of religious feuds. But its individuals fell victims to the massacre of St. Bartholomew and the phrensy of the Revolution in this, as in most other large French cities.

Rouen has given birth to some of the most illustrious names of whom France has to boast; amongst which may be specified Pierre Corneille, deservedly surd *le grand*, one of the greatest modern dramatists, here on the 6th of June, 1695; his brother, Thomas Corneille; Fontenelle, the academician, born here in 1657; Bochart, the famous oriental scholar; Daniel Defoe, author of the *Tales of the Great*; Hugo, art Rouen; Villermé, *Tableau des Ouvriers*, 1835; *Hand-loom Weavers' Rep.*

VEREDO (Germ. *Rosenthal*), a town of the Tyrol, frontiers of Austrian Italy, cap. circ. of its own name, Leno, near its junction with the Adige, 12 m. S. Trent. Pop. 7,200. It is well built, many of its edifices of marble. The most remarkable building is stle, on a height commanding the town. It has a civil, criminal, and commercial tribunals for the same, a gymnasium, and high school, and an English school establishment. In and round the town are silk mills, which employ, according to the *Encyclop.*, 8,000 hands. It has also tobacco her factories. (*Oester. Nat. Encyc.*; *Berghaus*; *At. Corographie*, &c.)

IGNO, a sea-port town of Austrian Italy, circ. on the Adriatic, 29 m. S. S.W. Trieste. Pop. has numerous fine churches and other public edifices and female schools, and 2 hospitals. Its principal is built after the model of St. Mark's at Venice. seat of civil, criminal, and commercial tribunals; harbour, one of which is tolerably secure; and in a considerable trade in wine, olives, timber, &c. and tunny. Its inhabs. are principally simple, or engaged in the fisheries; they are, how-ly occupied in ship building and making cables. town are some quarries of superior marble. (*Oester. Nat. Encyc.*; *Berghaus*)

Ó (an. *Rhodégium*), a town of Austrian Italy, cap. deleg., on the Adige, a branch of the river, in the swampy tract of the Polessin, 26 m. from, and 17 m. N. E. Ferrara. Pop., in 1837, 1,400. It is fortified in the old style, with walls flanked by a ditch, and a citadel; and is entered by a road leading to Rampoldi. It is rather a handsome town. (*Austrian Encyc.* says, it is ill-built, and

It has numerous churches, a seminary, and 3 orphan asylums, a large and fine theatre, an observatory and arts, and various superior public libraries of the Count Silvestri, comprising 15,000 vols. It is the seat of the archbishop of the deleg., and the residence of the archbishop of Adria. Though much decayed, it carries on a considerable trade in corn, a large fair being held here, and 3 weekly markets. General Bonaparte, in 1805, Duke of Rovigo. (*Rambaud*; *Austrian Nat. Encyc.*, &c.)

S., a town of Belgium, prov. W. Flanders, in the Middelbeke, a tributary of the Lys,

25 m. W. by S. Ghent. Pop., in 1843, 10,777. It has a high school, manufactures of linen fabrics, leather, soap, oil, &c., and some trade in butter of a superior quality. (*Henschling*; *Diet. Géog.*)

diced, and are prosecuted with considerable vigour at Hawick and Wilton; and in a lesser degree at Jedburgh, Melrose, and Kelso. The par. of Kirk Yetholm, in this co., is celebrated as being the residence of the largest colony of gypsies in Scotland. Roxburgh contains 21 parishes; and returns 1 mem. to the H. of C. for the co.; and the bor. of Jedburgh joins with other burghs in returning a mem. Registered electors for the co., in 1840-41, 2,001. Principal towns, Jedburgh, Kelso, Hawick, and Melrose. In 1841, this co. had 8,661 inhab. houses, and 46,025 inhabs., of whom 21,941 were males, and 24,084 females. Valued rent, \$14,638. Scotch. Annual value of real property, in 1843, \$54,304.

RUBICON. See ITALY, ante, p. 66.

RUDGELEY, a market-town and par. of England, co. Stafford, and E. div. of hund. Cuttlestone, on the S. bank of the Trent, crossed here by a fine aqueduct of the Grand Trunk Canal, 8 m. E. S. E. Stafford, and 123 m. N. W. London. Area of par., 7,120 acres. Pop., in 1841, 3,774. The town is well built, comprising many good houses, and a few that may even lay claim to elegance. The par. church, an ancient structure, with a handsome tower at its W. end, has recently been enlarged and almost rebuilt. The living is a vicarage in the gift of the dean and chapter of Litchfield. There are places of worship for different classes of dissenters, and several Sunday-schools. A free grammar-school was founded here by Queen Elizabeth: an endowed school furnishes clothing and instruction to 25 boys; besides which there is a national and infant-school. Hopkins's Almshouses afford relief to aged poor women, and there are several money charities. The principal manufacture of Rudgeley is that of hats and fells; but other articles are made here. A stream, which runs through the town to the Trent, turns several colour and corn mills, and there are some iron-forges. At Brexton, within the par., are extensive collieries, employing from 500 to 600 men. The town derives considerable advantages from its position on

the great line of canal communication between the W and E seas. Its government is vested in 3 commissioners, chosen by the House of Commons on Tuesday (last) April 17, June 8, and Oct 21, for terms and until.

RUGBY (an *Hamlet* or *Stately*) a market-town and par of England on Warwick Road, England, on the Acon, 20 m E of E Birmingham and 75 m W London. Area of par 2,110 acres pop. in 1881, 6,418. The town, on an extensive S of the river consists of 5 streets, one of which, leading to the church, is broad, and lined with modern brick houses. Indeed great improvements have been made within the last few years, and the advantages derived by the town from its proximity to the Birmingham Railway seem likely still further to promote its prosperity. In the other part of the town, however, there are many houses of plaster and timber denoting the former poverty of the place. The church is an ancient building, possessing little architectural interest, with a square embattled tower having a turret at the S E angle. The living is a rectory, of the annual value of £101, in the gift of Earl Grosvenor. There is also a dissenting church of very recent erection. The Wesleyan Methodists and Baptists have places of worship, and there are several Sunday schools, a charity school for 50 children of each sex, with classrooms and other edifices. The chief importance of Rugby, however, is derived from its great public school to which the talents of several of its former masters and the vicissitudes of its endowments have given a well-merited celebrity. It was originally a simple grammar school, founded in 1567, by Lawrence Sherborne citizen of London, a native of the neighbourhood, for the benefit of the town and neighbourhood of Rugby. Any person who has resided during 5 years in, or within 10 m of the town, may send his son to be educated free of expense, but if the parent resides out of the town, his son must then lodge at one of the boarding houses of the school paying the same rate for his board as those sent on the foundation. The number of boys on the foundation is unlimited, but the masters may not receive more than 100 boys not on the foundation. The number of scholars may at present average about 200, about 10 of whom are on the foundation. The school property consists of land within the par, and of about 5 acres of land, called the Conduit Chase, in the neighbourhood of Lamb's Conduit Street, London, the value of which has in greatly increased, in consequence of the buildings erected upon it, that the annual revenue of the school, which, at the middle of last century were under 1000, a year now exceed 5,000. The management is vested in 18 trustees, and the school is under a head master and eight assistant masters, with subordinate teachers of singing French, &c. The study of classical literature is carried out as high as elsewhere, and the students of the boys at examinations for scholarships at Oxford and Cambridge, show that their knowledge is of a substantial character, but at the same time, history, mathematics and modern languages, as well as modern, physical and political geography, arithmetic and mathematics (as far as words entailed), and French, constitute integral parts of the course of instruction. An annual examination is held at Christmas, and the names of the boys that distinguish themselves are published in a class paper. The school has 14 exhibitions, established by the founder. These exhibitions are elected every year by the trustees on the report of masters sent from the universities of Oxford and Cambridge. These exhibitions are of the value of £5 a year and may be held for seven years during residence in any college at either university. There are likewise 10 scholarships, of the annual value of £25 each, supported by subscription, one scholar is elected every year and his age must not exceed 14 years at the time of his examination. The scholarship is granted for six years if the boy holding it remains as long at Rugby. The greatest buildings of this great university consisted formerly of a master's house, and two or three school rooms, all of very limited size and shabby exterior, totally inadequate to the wants of the increasing establishment. In 1855 however the erection of a large and handsome pile of buildings was commenced on the site of the old school-house at the S extremity of the town. The edifice is of white brick, decorated with stone at the angles, windows, and cornices, the whole being of Tudor architecture. The principal front is 200 feet in length, and the schools are entered by a turretted gate, very being the street and leading to the principal court, a fine area, 60 ft in length, by 75 ft in breadth, having elms on three of its sides. The buildings on the E side comprise the dining-hall of the head master's lodgings and three school rooms, on the W side is the great school room, and on the N side are schools for the French and writing classes. The apartments of the head master are handsome and commodious, communicating also with the various departments running round the quadrangle over the school rooms. The school chapel is a detached building, in the new pattern style, the interior being fitted up with stalls and handsomely carved

roofs, the ceiling is decorated with paintings, and over the altar is the statue of Dr. James, a late head master, by Chantrey. Rugby has no manufactures, and the industry of the vicinity are principally agricultural. The trade of the town, however, has been greatly increased by the opening of the Birmingham Railway which has one of its stations here, and it is now an important railway between the surrounding country and the metropolis. The Oxford Canal passes, also, within a short distance of the town, connecting it with the principal inland navigation of England. On an extensive N E of Rugby are some slight remains of a castle, supposed by Douglas to have been erected in the reign of Stephen. Large quarries are quarried for soap and provisions, a great town (St. Mary's, and 10 other fairs. (See *Chor. Comm. War. Report*, *Journal of Education*, vol. 186-188, *Railway Handbook* &c.)

RUGBY an island in the Baltic, belonging to Prussia, opposite to Stralsund, and separated from Pomerania, by a strait varying from 14 to 3 m in width. It is of an exceedingly irregular shape, being deeply indented by bays and arms of the sea. Area, 244 sq. m. Pop., about 25,000. It is very fertile, and contains annually large quantities of corn, &c. to Stralsund. Rugen differs much in appearance from the mainland part of Pomerania, its coasts consisting mostly of high, precipitous, rocky cliffs. It is well wooded, and being surrounded by water, as well as deep narrow bays, its scenery is highly picturesque. This circumstance, and its facilities for sun-bathing, render it a favourite resort to summer. The islands are primitive in their habits and manners, industrious, and frugal. They are principally of the reformed religion, and their language is a dialect of low German intermixed with Swedish. The fishing in the adjoining seas and bays is very productive. Unfortunately the island has no good harbour, and its coasts are very dangerous. A lighthouse, having the lantern elevated 197 ft above the level of the sea, has been erected on the most northerly promontory of the island, in lat. 56° 41' 17" N long 12° 47' 27" E. Rugen, the capital, situated in the centre of the island, has 3,700 inhabitants. After being long in possession of Sweden, Rugen became part of the Prussian dominions in 1815.

RUHPOUR (Bengal), a dist of British India, ground and sea bound, between lat. 25° and 27° N., and long 85° and 91° E. having E. Azam, S. Mysore, and Durgam, W. the latter and Purnea, and N. Bikaner and Bikaner. Area, 7,200 sq. m. Pop. in 1881, 1,240,000. It is wholly on the N side of the Ganges, and is intersected by the Brahmaputra and Teesta. The climate is not so hot as in most other parts of Bengal; the soil is inferior to that of the Durgam district. Tobacco is the staple product. Wheat is also a considerable crop, barley, oats, maize, cotton, and indigo, are little grown. A good deal of cotton-thread is manufactured, spun in the district, the material being imported by way of Meerut. Total land revenue, in 1881-82, 1,000,175 rupees. Hindus and Mohammedans are supposed to be nearly equal in point of numbers. Chief towns Bhangpur, the cap., Bhangpur, Chittagong, and Goulam. Bhangpur, in lat. 25° 47' N., long. 89° 27' E., has been estimated to have a

RUSSIA, the most extensive, and one of the most powerful empires, either of ancient or modern times. It comprises the whole northern portion of the eastern hemisphere, from the frontiers of Persia and the Gulf of Bothnia on the W., to the Pacific Ocean and Behring's Straits on the E., or from the 10th to the 160th deg. of E. long, being a distance, on the 60th deg.

(1) is very fertile and there are in one spot found in the mountains, but there is no doubt that the climate is very different from that of a plain near to the sea.

little better than a desert, being level, dry, high, barren, and full of salt lakes.

"The country lying on the other side of the Oural mountains, known by the name of Siberia, is generally a flat tract of vast extent, declining imperceptibly towards the Frozen Ocean, and rising thence by equally imperceptible degrees, towards its southern border, where at last it is lost in the immense mountain ranges which separate the Russian and Chinese empires. It is unnecessary to notice in detail the different great divisions of this vast territory. In general it may be stated, that the more southerly portion of Siberia, or that between the S. frontier of the empire and the 57th or 60th deg. of lat., as far E. as the river Lena, has, for the most part, a fertile soil; and that, notwithstanding the severity of the climate, it produces most kinds of grain. But, owing to the increase of cold and the nature of the soil, the more northerly portion of the region now noticed, or that extending from the 57th or 60th deg. of lat. to the Frozen Ocean, and the whole country E. of the Lena, from the frontier of Manchouria northwards, is wholly, or almost wholly, unfit either for cultivation, or for the grazing of cattle. In the E. a portion of this vast tract is mountainous, but it mostly consists of immense levels, full of swamps and bogs, covered with moss, which would be totally impassable were it not that the ice, which never thaws deeper than a few inches, gives a firm under footing." (*Eng. Trans.* p. 5.)

Notwithstanding the heats that usually prevail during summer, especially in the southern provinces, cold, speaking generally, predominates very decidedly in Russia. With the exception, indeed, of the Crimea and the transcaucasian provinces, no part of Russia can be said to be generally hot; and even in them the frost in winter is often very severe. The climate of Russia is, in fact, proverbial for its severity; and this increases not only as we advance towards the N. but also as we advance towards the E.; the cold being decidedly greater in Siberia than in the same latitudes in European Russia, a difference which is also sufficiently perceptible in the provinces on the E. and W. sides of the latter. This, no doubt, is owing to various causes; but principally, perhaps, to the greater cultivation of the western provinces and their proximity to the Baltic; and to the vast extent of frozen sea and land traversed by the winds from the N. E. Beyond the 65th degree of lat. the ground is covered with snow and ice for about nine months in the year; and during the other three months ice is always found at a little distance below the surface. Corn crops cannot be depended upon in European Russia beyond the 62d degree of lat.; and the great agricultural provinces lie to the S. of the 58th deg. The fruits of temperate climates are seldom met with beyond the 52d deg. At Petersburg, in lat. 59° 56', the mean maximum of cold is about 24°, and the mean maximum of heat 23°, Reaumur. The Neva is commonly frozen over before the end of November, and the ice never breaks up before the end of March. At an average of ten years it is calculated that there are annually at Petersburg 97 bright days, 104 rain, 72 snow, and 93 unsettled. At Moscow, in lat. 55° 45', the cold is more severe than at Stockholm in lat. 59° 20'. At Astrakhan, in lat. 46° 21', nearly the same as that of Lyons, the Volga is sometimes frozen over so as to bear loaded waggons. The sea of Azov is usually frozen over from November to the beginning of April. In Siberia, as already stated, the cold is much more severe than in the provinces to the W. of the Oural mountains. The breaking up of the ice on the Lena does not take place before the beginning of May.

But this severe cold is not unhealthy, and is much less inconvenient than might be supposed. While the frost lasts the air is pure and bracing, and its severity is guarded against by warm clothing, and by having the houses properly constructed and heated. At Petersburg and Moscow the winter is, in fact, the finest season. The inhab. seem to revive at its approach. Sledge-roads over the snow render travelling commodious and agree-

able; and a winter journey in a moderate frost by moonlight is a high enjoyment. The Russian peasants care only for warm covering for their legs and feet. At Petersburg, in a frost of 25° Reaumur, it is common to see women standing for hours together washing their linen through holes dug in the ice over the Neva!

Spring can hardly be said to have any place in the Russian calendar. The transition from frost to fine weather is usually very rapid. In a brief period after the snow and ice have disappeared, the fields and trees are clothed in the livery of summer, and vegetation makes an extraordinary progress. At Petersburg the summer is as mild and agreeable as in the S. of France; but there and in all the N. provinces it is very variable. As we advance towards the S. it becomes steadier, and the heats increase. At Astrakhan the mercury in the thermometer sometimes rises to 103° Fah.; and in the transcaucasian provinces it rises still higher. The autumn, or the period of transition from summer to winter, is the most unpleasant season in Russia. The sky is generally cloudy, and rains and storms are very prevalent. The Crimea, from its high S. lat., and its being embosomed in the Euxine, has the most agreeable climate in the empire.

Divisions, Population, &c. — The divisions of the Russian empire have differed materially at different periods. Peter the Great made some important changes in the distribution that had existed previously to his epoch. The whole, however, was remodelled and placed on a new footing by Catherine II. in 1775. She divided the entire empire into three great regions; those of the North, Middle, and South. Each of these regions was subdivided into governments, of which there were at first 42, and at the end of her reign 50. Paul made some ill-advised changes on this distribution, which were set aside on the accession of Alexander. The existing divisions were mostly fixed by the latter in 1822, nearly on the basis laid down by Catherine. The empire, exclusive of the kingdom of Poland, is divided into governments, exclusive of certain territories called provinces, or *oblasts*, not formed into governments. Some of these divisions, particularly those in Asiatic Russia, are of vast extent; but neither their boundaries nor their population are well ascertained. But, as the best that can be had, we subjoin M. Kœppen's table of the area and population of the different provinces included in the empire. [See top of next page.]

Animal and Vegetable Products. — The animals of Russia include those commonly met with in the arctic circle, and in temperate climates, as well as some of those belonging more peculiarly to the intertropical regions. Exclusive of horses, oxen, sheep, &c., reindeer and camels are both met with. The latter is employed in travelling through the deserts in some of the S. provs., while the former constitutes the principal wealth of the Samoyedes, Tungusians, Ostiaks, Tchouktchis, and other tribes inhabiting the extreme N. parts of the empire. The dog is common everywhere; and in parts of Siberia, where there are neither horses nor reindeer, is of the very greatest utility; and besides being employed for draught and burden, is used as food. Beasts are abundant; beavers and other fur-bearing animals are also common; and in many provs. the chase forms a principal part of the occupation of the people. The rivers and lakes swarm with fish.

All sorts of corn succeed in Russia; though, as already stated, the crops cannot be depended upon above the 62d deg., nor is cultivation attempted in any part of the empire beyond the 65th deg. Fruits of all sorts are abundant in the S. provs. The vine is cultivated in the vicinity of Astrakhan, in the Crimea, and in the Caucasian provs.; but the wine made from it is of a very low quality. Though meadows are not abundant in Russia, the pastures in most parts are excellent. The forests will be afterwards noticed.

Minerals, Working of Metals. — Russia has for a lengthened period produced considerable supplies of the precious metals; but her importance in this respect has increased prodigiously of late years, and she now (1846) supplies a much larger quantity of gold than any other country. It is partly obtained from mines mostly situated in the Oural Mountains; but it is principally obtained from the auriferous sands of various rivers in Siberia, which have their sources in the Altai Mountains. Such has been the increase in the produce of the latter, that while, in 1830, little more than 5 poods were obtained from the washings in Siberia, they yielded, in 1846, no fewer than 1363 poods! We subjoin an

Account of the Produce in Gold of the Mines of the Oural and of the Washings of Siberia since 1837, with their value in sterling.

	In the Oural Mountains.	In the Siberian Washings.	Total.	Quantity of fine Gold.	In Troy Weight.	Value at the Rate of 113.851 Grains Troy per £1 st.

Peasants	230,868	201,467	Grand total of both sexes	43,132,560	
Inhabitants of Towns.					
Peasants	121,947	100,714			
Peasants, artisans, etc.	1,209,434	1,253,582			
Peasants in the eastern provinces	7,368	5,966			

These quantities considerably more than half the of the Oural Mountains, and nearly the whole of the Siberian washings, are from private. For example in the last year the proportions

	Public Mines.	Private Mines.
Public	129-58	135-07
Private	58-03	1,504-85
Total	1,677-58	1,639-92

the produce of the private works, a duty varying 2 to 24 per cent. is charged, which occasions so much muggling, that the returns are estimated to be 5 per cent. below the actual produce. Considerable quantities of platinum and silver, copper, &c., are also produced. The iron-mines furnish more than sufficient for the wants of the empire. Works in the Oural mountains only are said to employ 50,000 labourers; and iron is also procured in Al, Caucasus, the Valdai Hills, &c. The total of iron is said by Schultze to amount to 9 poods; and may now, perhaps, be taken at 12 millions poods, or from 160,000 to 180,000 Food only is used in the iron-works and foundries. Russia. Mercury, antimony, zinc, cobalt, &c. in Siberia.

Cast-iron articles are prepared at most mines where there are forges. There is an important cannon manufactory at Petrosavohak, in the government of Olonez, which was brought to a high state of perfection by an Englishman of the name of Gascoigne. But the principal hardware manufactories are carried on at Tula, in the government of that name. (See TULA.) A great variety of articles of cutlery are produced; and the royal manufactory of fire-arms is very extensive, employing, it is said, about 7,000 male and 9,000 female workers. (Schultze, *La Russie, la Pologne, &c.*, p. 315.) Very different statements have been made as to the quality of the arms produced at Tula. Those of Dr. Clarke were speedily confuted by the exploits of the Russian forces; and no doubt the manufacture has been since materially improved. At present we are assured, on undoubted authority, that though the arms produced at Tula be inferior in point of finish to those made in England, they are of very good quality.

Russia is abundantly supplied with mines of salt and brine springs; but as most of them are at a great distance from the Baltic and western provs., there is a large importation of salt from England and Austria. The salt mines and brine springs in the government of Taurida (the Crimea), are the most extensive, and furnish annually about 16 millions poods (nearly 260,000

tons): those of Perm, which annually supply about 7 millions poods, are the next in importance: the mines of Iletak, in the government of Orenbourg, furnish about 300,000 poods, exclusive of what is furnished by the salt lakes, and additional supplies are obtained from various other mines and springs.

Agriculture.—Landed property in Russia is generally divided into estates belonging either to the crown or the nobility. Some of those belonging to the latter are very extensive; but, owing to the compulsory division of estates among the children of a family on the death of the father*, this is not generally the case; and the too great subdivision of the land is, in fact, one of the evils with which Russia is threatened. The peasants occupying the crown estates are in a state of *predial*, and those occupying the estates of the nobility are generally in a state of *absolute*, slavery. The value of a Russian estate formerly depended more on the number of labourers or slaves belonging to it, and which may be either sold, or let out by the proprietor, than on its extent, or the quality of the soil: but since the increase of pop. this, in many districts, is no longer the case; and the proprietor is sometimes burdened with the charge of supporting and maintaining labourers, and paying the tax on them to government, for whose services he has little or no use. Different proprietors adopt different methods in the management of their estates. In the principal part of Great Russia, comprising all the central provs. of the monarchy, the system is very simple. The proprietors rarely farm any considerable portion of their estates, or interfere with the mode in which they are cultivated. They usually content themselves with distributing them among the peasantry; their revenue consisting in the produce of an *obrok*, or capitation tax, imposed on each male peasant, by way of rent. In the Baltic provs., on the other hand, the owners usually retain a quarter, or some less proportion, of their estates in their own possession, managing them either directly, or by the intervention of stewards or agents. The peasants on such estates are allowed cottages, having pieces of ground attached, generally, perhaps, about 15 acres, sufficient for their support; their *obrok* or tax being paid by labour, or *corvées*, performed on the lands held by the proprietor, or let by him to others. In the Ukraine and other S. provs., the peasants are partly free; and these pay for the lands they occupy, sometimes money, but more frequently produce and labour rents. There is also a class of small proprietors who cultivate their own lands, but who have not the privilege of holding slaves.

It may seem at first sight that, provided its amount were moderate, the system of parcelling out land to occupiers charged with an *obrok* or capitation tax, could not be fairly objected to. And when such is the case, and the landlord allows the occupiers to reap the fruit of increased economy and exertion, this is no doubt the preferable mode of dealing with slaves. But the vice of the system is that, except on the crown estates, every thing depends on the will of the proprietor, who, though occasionally enlightened and liberal, is too frequently ignorant of his real interests, careless, and embarrassed. The occupier has, in fact, no security whatever. If he improve his farm, or have about him the appearance of getting rich, the chances are that his *obrok* will be immediately increased; or that a portion will be taken from his farm, and given to another family. Even the *predial* slaves on the crown estates, from whom only a certain amount of labour or of *corvées* can be legally demanded, are frequently exposed to the extortion of those to whom the lands are let, or of the officers employed to superintend them. Hence, in the generality of instances, the peasants invariably follow a routine system; they avoid labour by which they are not to benefit; and it is seldom, except on the lands managed by the proprietors themselves, or on those occupied by the few free tenants to be found in the country, that any considerable improvements are ever attempted. When the pop. of an estate parcellled among peasants is increased, a new distribution of the land has to be made; and, if unoccupied land cannot be assigned to the new families, they are provided for by diminishing the shares apportioned among the old ones. On such occasions, if the occupiers complain that their *obrok* or tax is too heavy, it is usual to grant those on whom the proprietor can depend, license to leave the estate; and, though they still continue slaves, many avail themselves of this permission, and migrate to towns where they exercise some trade or profession, from the profits of which they frequently pay a much higher *obrok* than was imposed upon them in the country, and accumulate sums with which to purchase their freedom.

It is evident from these statements, and from the influence of the compulsory division of estates in preventing improvements by the proprietors, that agriculture in Russia must be at a very low ebb. But though this be its general condition, it differs materially in different

provinces; and some estates, even in the most backward provs., have been greatly improved. In Livonia, and the provs. bordering on the Baltic, and also in parts of the Ukraine, the husbandry is very superior, and the implements quite equal to the best that are to be met with in most parts of Germany. But, with the exception of a few estates, it is quite otherwise in the rest of the empire.

The plough is there a wretched implement drawn by one horse, and calculated rather to scratch than to turn up the soil. The harrow is made of wood; and rollers and hoeing machines are entirely unknown. Were it not that the soil is generally light, friable, and very easily wrought, it would be impossible to cultivate it by such means. But these suffice to make it produce more than enough for the wants of the inhabs. There is not, indeed, as Mr. Loudon has truly stated, another country in Europe where corn crops may be raised at so little expense of labour as in Russia.

Exclusive of the forests, and the sandy deserts of the south, vast tracts in the northern parts of the empire are, and always must be, unsuceptible of cultivation. Taking the whole surface of European Russia at 402 millions of deciatines, M. Schnitzler supposes that the cultivated land does not exceed 61½ millions, and the meadows (chiefly in Livonia and Cornland) 6 millions deciatines. (*Essai Statistique de la Russie*, p. 34.) The products vary, of course, with the differences of soil and climate. All sorts of corn are raised; but rye being the common food of the peasantry, it is produced in much greater quantities than any other sort of grain. Next to rye is oats; and the value of the crops of these two, taken together, is supposed to be more than double the value of the crops of wheat, barley, and of every other kind of corn. Orel, Kasan, Nijni Novgorod, Penza, Tambof, and Koursk are the most productive provs.; and it is in them that the greatest quantity of wheat is raised. According to the official returns, which, however, in these matters are little to be depended upon, there were sown in European Russia, in the latter part of 1834, 20,349,149 chetverts winter corn (rye and wheat); and in the following spring, 30,398,046 chetverts spring corn; the return to the former being, at an average, 4½ for 1, and that of the latter nearly 4 for 1. But, in the best districts, wherever the land is moderately well cultivated, the produce is much greater; and is, indeed, no-wise inferior to that of the most favoured countries. Corn in Russia is very frequently kiln-dried in the sheaf, before it is either stacked or thrashed. Flax and hemp are very extensively cultivated; and, besides what is made use of at home, are very largely exported. Potatoes succeed almost everywhere; and this, also, is the case with hops. Tobacco is confined to the S. provs., where it is an important article. It deserves to be mentioned, to the credit of the government, that it has lately been exerting itself in the most efficient manner for the improvement of agriculture. Professorships of agriculture have been established in the different universities; and an institution to which a model farm is attached has been established near Mohilew for educating 120 pupils, so as to fit them to act as stewards or managers of large estates.

Horses are very abundant in Russia. Speaking generally, they are coarse and ill shaped, but hardy and active. In the southern provinces, however, whence the cavalry horses are brought, the breed is very superior. The khans or cheiks of the nomadic tribes occasionally possess as many as 10,000 horses.

M. Storch states that there is no country in Europe where so many cattle are reared as in Russia, and none where they are taken so little care of. (*Tableaux de la Russie*, ii. 155.) Exclusive of the numerous herds, which constitute a principal part of the wealth of the pastoral and nomadic tribes, every peasant has a few head, and even the beggar has a cow or a goat! The ordinary Russian ox is small, lean, and bony; but those of the Ukraine, Podolia, Volhynia, and some other provinces, are large and of a very fine breed. Many thousand head are annually sent from the Ukraine to Petersburg and other Russian towns, and also to Silesia and Germany. Tallow is at present, and has been for some years, the most important article of export from Russia: the increase of the exports of this article from Odessa within these few years has been quite extraordinary. The wool of the common Russian sheep is hard and coarse; but latterly considerable efforts have been made to improve the breed by importing fine woolled sheep from Germany; and wool, notwithstanding the increase of factories at home, is becoming an important article of export. Thus, during the period from 1814 to 1834, the annual average export of wool amounted to only 1,264,668 lbs., whereas, in 1838, it amounted to very near 13,000,000 lbs. valued at 552,000*l*. Hogs are everywhere abundant, and, in the northern provinces especially, furnish a principal part of the food of the people, while their bristles are an article of export. Goats are also abundant.

The rearing and management of bees is more attended to in Russia than in any other European country, and is,

* One seventh of a man's landed property goes, on his death, to his widow for ever; one fourteenth goes to each daughter; and the residue is equally divided among the sons. (*Pescator's Russia*, 132.)

is fact, the principal occupation of several tribes. The wild bees, however, greatly exceed those that are domesticated. Their culture is principally attended to in the provinces of Kasan and Ourga. Individuals among the Bashkirs possess 100 hives in their gardens, and upwards of 1,000 in the forests! (Storch, *Tablicam*, ii. 248.) Honey is very extensively used in many parts instead of sugar. The export of wax is very considerable. In 1834, it amounted to 33,248 poods, or 800,928 lbs.

Manufactures—are not generally in an advanced state. Since the reign of Peter the Great, their improvement and extension have, it is true, been favourite objects with the government; and heavy duties and prohibitions have, in consequence, been imposed on such foreign articles as it was supposed might interfere with similar articles of native growth. This, however, was a very erroneous policy. The slavery of the peasantry is an all but invincible obstacle, in so far as they are concerned, to the formation of those habits of industry, perseverance, and invention, necessary to insure success in manufactures; while the thinness of the population, the variety of natural products, and the fertility of the soil, all concur in pointing out agriculture, including under that term mines and fisheries, as the natural and most advantageous employment that can be carried on upon a great scale, till civilization be more generally diffused. In fact, considering the peculiar circumstances under which Russia has been placed, and the deficiency of her capital, her wonder rather ought to be that she has made so great a progress as she has done in manufacturing industry, than that she should still be so backward. Among the peasantry generally, there is little or no subdivision of labour. Each family commonly supplies itself with all the clothing and furniture which it requires. Sometimes, however, a person superadds some particular employment to his ordinary avocations; and sometimes this principle is carried farther, and the inmates of entire villages devote themselves to some particular trade. It is only in pretty large towns that the division of labour, such as it exists amongst us, is carried to any considerable extent; and even there it is a common complaint that the native products, though showy, are seldom substantial or good. "*Si le génie de l'invention lui manque,*" says Schnitzler, "*le Russe possède en revanche, au plus au degré, la facilité d'imiter ce que d'autres ont produit; un esprit vif et exercé lui fait dériver les procédés qu'il a suivis. Mais, pressé de gagner, et manquant de révérence, il travaille à la hâte, plutôt pour l'apparence que pour la durée, et les produits de toute espèce sont toujours infiniment au-dessous des ouvrages exécutés par des mains étrangères.*" (*Tableau de la Russie*, p. 125.) The versatility of the Russian peasant is striking. He is truly a Jack of all trades, and will turn hand to whatever may be required. "He will plough to-morrow, help to build a house the third day, weave to-morrow, help to build a house the third day, and the fourth, if his master need an extra coach, he will mount the box, and drive four horses as if it were his daily occupation. None of these actions, except, perhaps, the last, will be as well performed as in a country where the division of labour is thoroughly understood. They will all, however, sufficiently well done to 'serve the turn,' a favourite idiom in Russia. The people are very ingenious, but perseverance is wanting; and though they carry many arts to a high degree of excellence, they generally stop short of perfection; and it will be very long before their products come into competition, for finish, durability, or cheapness with English goods." (*Venables' Russia*, p. 141.) In certain departments, however, Russia is not merely but even superior to other countries. Her leather is excellent; and for some purposes, such as bookbinding, is decidedly superior to any other material. The process followed in the preparation of this important article is often described; and foreigners have frequently engaged in the business in Russia, with the view of becoming themselves acquainted with the details, that they might undertake it at home. But, whether it be owing to the nature of the bark or the water, or to some other overruled cause, none of the attempts to produce leather in foreign countries have ever succeeded, and Russia continues to enjoy a monopoly of this valuable product, and to export it in large quantities. The cloth, cordage and canvas, tick, felt, mats, pot-pourri, candles, caviar, kinsglass, spirits, and some articles produced in Russia, are quite as good, or better than those of any other country.

As early as 1788, almost all the cloth required for the uniforms of the army was imported from abroad; but it is now wholly manufactured at home. Cloth of a superior quality is also made at Moscow and its vicinity, at Samara, Petersburg, Sarapka, and other places; but, speaking generally, it is both inferior to what might be expected, and dearer. Linen is principally manufactured at Vladimir, Kostroma, Moscow, and Kalouga; cloth and cordage in Archangel, Orel, &c. The manufacture of Moscow is extensive and thriving, and carried on to a less extent in other towns. Nu-

Account of the Quantities of the principal Articles of Russian Produce and Manufacture Imported into the United Kingdom from Russia in 1849.

Articles.	Quantities.	Articles.	Quantities.
Bristles - - lbs.	2,141,505	Plain linen - val.	13,077

Water Communications.—The great road from Petersburg to Moscow is justly said by Lord Londonderry to be a most magnificent public work. It is nearly 500 m. in length, quite level, about double the width of the Great North Road in England, and is macadamised throughout, and kept along the whole line in the most perfect repair. *Town*, i. 144.) But, with the exception of this and of a few other principal lines, there is a great want of good roads in Russia. This, however, is productive of less inconvenience than might be expected, from the circumstance of the frost rendering the worst roads fit for sledge travelling for a considerable period of the year; and from the number of navigable rivers and the extension that has been given to their navigation by the construction of numerous canals. By these means a water communication has been effected between the great navigable river the Wolga, which has its embouchure in the Caspian Sea, and Petersburg and Archangel: the Wolga has also been united with the Don, which falls into the sea of Azoff. The Pripiet, an affluent of the Dniepr, which falls into the Black Sea, has been connected with the Bug, an affluent of the Vistula, while the latter has been connected with the Niemen.

Few countries, in fact, have so extensive a command of internal navigation. Goods put on board in Petersburg may be conveyed to Astrakhan, a distance of above 1,400 m., or to any port on the Caspian, and *vice versa*, without once being landed. The iron and furs of Siberia and the teas of China are received at Petersburg in the same way; but owing to the great distance of these countries, and the short period of the year during which the rivers and canals are navigable, they sometimes take three years in their transit! Immense quantities of goods are conveyed during winter upon the ice in sledges, to the different ports, and to the nearest *pristans*, or places in the interior, where barks are built for river or canal navigation. They are put on board in anticipation of the period of sailing, that the barks may be ready to take advantage of the high water, by floating down with the current as soon as the snow and ice begin to melt. The cargoes carried up the river into the interior during summer are principally conveyed to their ultimate destinations by the sledge roads during winter. The conveyance by the latter is generally the most expeditious; and it, as well as the internal conveyance by water, is performed at a very moderate expense.

The barks that come from the interior are mostly of a very rude construction, flat-bottomed, and seldom drawing more than 20 or 30 inches water. When they arrive at their destination, they are sold or broken up for firewood. Those that leave the ports for the interior are of a superior description, and are comparatively few in number; the commodities imported being, at an average, of much greater value, relatively to their bulk and weight, than those that are exported.

As illustrative of the importance of the inland navigation of the empire, we may mention that, in 1839, no fewer than 46,850 boats and 17,469 rafts arrived from the interior at the different great ports and emporiums of the Russian empire, the goods so conveyed being worth 538,921,730 roubles. Of these, 22,842 boats and 784 rafts, value 196,974,904 roubles, arrived at Petersburg; 1,362 boats and 1,235 rafts, value 15,281,500, at Archangel; 1,965 boats and 1,373 rafts, value 32,437,378, at Riga, and so on.

Accounts in Russia are kept in roubles and kopeks: but the rouble is of two kinds, very different in value. The silver rouble is worth from 3s. 2d. to nearly 4s. Engl., varying according to the distance from the capital. The paper rouble, worth about 10d. Engl., and usually considered equivalent to a franc, is the basis of all mercantile calculations, and is divided into 100 kopeks. The kopek, worth consequently about a centime, is a copper coin. The only gold coin is the demi-imperial, value about 20 fr. Since 1828, platina coins, worth about 1l. sterling, have been struck; but they are not yet of any practical importance. The Russian lb. is rather larger than the avoirdupois lb.; the last = 13·8 quarters; the

chetvert, the measure for corn, = 8·75 Eng. bushels; the *deciatine*, land measure = about 2·7 acres; the *verst* of 104·5 to a Geog. degree = 1,167 yards, 3 versts being about equivalent to 2 Eng. miles.

Native and Foreign Merchants, &c.—Every Russian carrying on trade must be a burgher, and have his name registered in the burgher's book; he thus acquires an unlimited freedom of trade. All whose names are in the burgher's books are either townsmen who have property within the city, or members of a guild. There are three guilds. Those belonging to the first report themselves to possess from 10,000 to 50,000 roubles: these may follow foreign trade, are not liable to corporeal punishment, and may drive about the city in a carriage drawn by two horses. Those belonging to the second guild declare themselves possessed of from 5,000 to 10,000 roubles: they are confined to inland trade. A capital of from 1,000 to 5,000 roubles entitles its owner to admission into the third guild, which comprises shopkeepers and petty dealers. The rates paid by the members of these guilds amount to 1½ per cent. upon their declared capital, the statement of which is left to the conscience of every individual. Burghers are not obliged to serve in the army, but may provide substitutes, or pay a fine. The *guzats*, or foreign merchants who enrol themselves in the city, register on account of their commercial affairs, enjoy privileges nearly similar to those enjoyed by the members of the first guild.

None but native Russians are allowed to engage in the internal trade of the country; and hence a foreigner, who imports goods into Russia, must sell them to Russians only, and at the port where they arrive. A few foreigners, indeed, settled in Russia, and having connections with the natives, trade with the interior: but it is contrary to law, and the goods are liable to be seized. In 1836, the merchants of the three guilds amounted, in all, to 128,854 individuals.

The merchants engaged in foreign trade are mostly foreigners, of whom the English are the principal. The peculiar privileges formerly enjoyed by the latter are now nearly obsolete, and their rights, in common with those of other foreigners, are merely those of guests. The English factory at Petersburg is, at present, little else than a society formed of some of the principal English merchants, several of whom, however, do not belong to it: its power extends to little else than the management of certain funds under its control.

Owing to the scarcity of capital in Russia, goods, the produce of the country, are frequently paid in advance; and foreign goods are most commonly sold upon credit. From the month of November to the shipping season in May, the Russians who trade in flax, hemp, tallow, bristles, iron, &c., either come themselves to Petersburg or Riga, or employ agents to sell their goods to foreigners, to be delivered, according to agreement, in May, June, July, or August. The payments are made according to the circumstances of the sellers and buyers; sometimes the buyer pays the whole amount, in the winter months, for the goods which are to be delivered in the summer or autumn; and sometimes he pays a part on concluding the contract, and the residue on delivery of the goods. The manufacturers and dealers in linen usually come to Petersburg in March, and sell their goods for ready money.

Foreign goods were formerly almost entirely sold at a twelvemonth's credit, and some at a still longer term; but of late years several articles, as coffee and sugar, are sold for ready money: still, however, the great bulk of foreign goods for the supply of the interior is sold on credit. Most of the Russians who buy goods on credit of foreigners, for the use of the interior, have no other connection or trade with Petersburg than merely coming there once or twice a year to make purchases; which, having accomplished, they set off with the goods, and the foreigner neither sees nor hears of them again till the bills become due. It is obvious, from this statement, that experience and sagacity are nowhere more requisite in a merchant than here. He has nothing, in fact, but his own knowledge of the native dealers to depend upon: and it is highly creditable to the Russians, that foreigners do not hesitate to trust them with immense sums on such guaranty.

Government.—In Russia all power emanates from the sovereign, whose authority is uncontrolled, except by the respect he may yield to established customs, to the privileges of certain classes, and the prejudices of the people. The will of the monarch has no legal limits, so that he may be said to be absolute. The act of election of 1613, which conferred the crown on the house of Romanof, recognises the unlimited power of the sovereign. The empress Catherine and the emperor Alexander laboured to give order, simplicity, and regularity to the administration, and to reduce it to a system, so that it might be as independent as possible of the caprices of the sovereign. Alexander, indeed, proclaimed in 1811 that the law was in Russia superior to the sovereign, and gave to the senate the right of remonstrating against

anywhere (as an imperial decree is called) they thought contrary thereto. This, no doubt, seeing the way in which the senate is composed, is a very feeble check on the despotic power of the emperor. But it may well be doubted, whether, in the actual state of Russia, the present form of government be not better adapted to its wants than any that could be substituted in its stead. It is sufficiently clear, as well from general principles as from what has actually occurred, that Russian princes cannot safely follow a course of conduct generally disliked by the nation. On the other hand, however, the extent and unity of the sovereign power is the best security for the progress of civilisation, and for the improvement and well-being of the mass of the people. The latter being, for the most part, slaves, without property, intelligence, or influence, would be tyrannised over to an incomparably greater extent than at present, had the nobles any share in the government, or were they able to control its proceedings. What Poland was Russia would be, were the nobility or superior classes participating in the sovereign power. But the interests of the autocrat and those of the mass of the people are generally identical. Under his protecting *regis* civilisation is daily extending, and a class of free labourers is gradually growing up. The emperor is afraid of the nobles, not a few of whom are supposed to be tinctured with liberal opinions; but he has nothing to fear from their slaves. Hence the despotic power of the emperor over the latter has been materially reduced; very great changes for the better have been made in the condition of the peasantry on the crown estates; and the government has gone steadily on, with quite as much rapidity as circumstances would warrant, endeavouring to improve and advance the servile portion, that is, the great mass, of its subjects, and to pave the way for their ultimate emancipation. An enlightened despotism is, in fact, the most suitable government for such a country as Russia. A representative constitution would merely put additional power into the hands of a comparatively small class, and would be as little adapted to the wants of such a country as an absolute government would be to England.

The monarch is the central point of the administration: his decisions are law. Every thing emanates from him in the first instance, and every thing is referred to him in the last. The labour he has to undergo is great, and requires incessant activity.

The public business is transacted, under the emperor, by different boards, councils, or colleges, which have no separate, but sometimes not easily distinguished functions. The *Imperial Council of the Emperor* was established, on its present footing, in 1810. It consists of a president, and an indefinite number of members, of whom the ministers always make a part. It is divided into five departments of legislation, war, civil and criminal affairs, finance, and the affairs of Poland; and he superintendence of all matters connected with the internal administration of the empire. The second, or senate, was founded by Peter the Great in 1711, and is reckoned the most important body in the state. It performs various functions, partly of a deliberative and partly of an executive character, set forth in a ukase of 20th March 1802. It is the high court of justice for the empire, and includes all the inferior tribunals. The members are appointed by the emperor; at present their number is 100, and each receives a salary of 7,000 roubles a year.

The senate is divided into eight committees or sections, of which five sit at Petersburg, and three at Warsaw. Each committee is authorised to decide in the first instance upon certain descriptions of cases, brought immediately before it, or by appeal from the inferior courts. In a few cases, however, parties dissatisfied with its decisions may petition the emperor. The members are mostly persons of high rank, or who fill high offices; but a lawyer of eminence presides over each committee, who represents the emperor, and without whose signature its decisions would have no force. In the annual, or general meeting of the sections, the president of justice takes the chair, as high procurator for the empire. Besides its superintendence over the courts, the senate examines into the state of the public revenue and expenditure, and has power to inquire into abuses, to appoint to a great variety of offices, and to remonstrate to the emperor. Monthly reports of its proceedings are published in the gazette.

The third college consists of the *Holy Synod*, and to it is committed the superintendence of the religious affairs of the empire. It is composed of the principal dignitaries of the church. All its decisions run in the emperor's name, and have no force till approved by him.

The fourth college consists of the *Committee of Ministers*, of whom there are eleven, viz. the ministers of the household, of war, finance, justice, interior, education, imperial domains, post-office, roads, public buildings, and the vice-chancellor and comptroller-general. The ministers have frequently colleagues to supply their place when they are either

sick or absent. They communicate directly with the emperor, or with his *Chancellerie particulière*, in whose hands all the executive authority is centred.

The local administration differs in different provinces; government having always allowed conquered or annexed countries to preserve their own laws and institutions, except in so far as they were hostile to the general constitution of the empire. Finland, for example, has a special form of government; and the provinces wrested from Sweden by Peter the Great, Courland, and those formerly belonging to Poland, have peculiar institutions and privileges, which, however, have latterly been much modified. But, despite these exceptions, the form of the provincial government is, notwithstanding, sufficiently uniform.

The empire is divided into general governments, or vice-royalties, governments, and districts. There are, at present, 14 of the first, 50 or 51 of the second, and above 520 of the last. There are also, as already stated, extensive districts which, from the thinness of the population, or otherwise, are not organised into regular governments, which are called provinces, or *oblasts*. The viceroys, or general-governors, are the representatives of the emperor; and as such command the forces, and have the supreme control and direction of all affairs, whether civil or military. All the functionaries within their jurisdiction are subordinate to, and make their reports to them. They sanction or suspend the judgments of the courts, &c. A civil governor, representing the general government, assisted by a council of regency, to which all measures must be submitted, is established in each government or province. In case of dissent, the opinion of the governor is provisionally adopted till the pleasure of the emperor with respect to the matter be ascertained. A vice-governor is appointed to fill the place of the civil-governor when the latter is absent or unwell. There are also, in every government, a council of finance under the presidency of the vice-governor, who manage the crown estates, and superintend the collection of the revenue; a college of general provision, which has the direction and inspection of all charitable foundations, prisons, workhouses, schools for the instruction of the poor, &c.; and a college of medicine, which attends to all matters connected with the public health, appoints district physicians, inspects pharmacopœias, &c. The districts have each their local functionaries. The towns have a municipal body, elected once every three years by the different classes into which the free population is divided. And each town has, also, according to its importance, a commandant or bailiff, appointed by the crown, who has charge of the police, of the public buildings and magazines, and who executes sentences, pursues criminals, &c.

The Russian judicial system is complicated, and not easily understood, except by natives. There are civil and criminal courts in every circle; and a supreme court of justice, divided into civil and criminal sections, is established in every government. Cases decided in the inferior courts may be appealed to it. Its sentence is final in all criminal cases, and in all civil matters relating to sums under 500 roubles. Those involving property to a greater amount may be carried before the senate.

It is a curious fact that, notwithstanding the despotic nature of the government, all the provincial tribunals consist partly of elective functionaries. Thus, the superior court for a circle consists of a judge and secretary, and of two assessors chosen annually by the nobles, and two by the peasants; and the superior court of justice for a government, which is divided into a civil and a criminal chamber, consists of a president, secretary, and 4 assessors for each chamber, 2 of the assessors being chosen by the nobility, and 2 by the burghers. It is, in fact, a principle in Russia, that a portion of the judges in every court should belong to the same class as the party whose interests are under discussion, and be elected for that purpose by his compeers. In the case of the nobility and burghers, this is a most valuable privilege; but in the case of the peasantry, who stand most in need of protection, this privilege is quite illusory; their slavery and ignorance making them utterly incapable of profiting by it.

Previously to the reign of the Empress Catherine II., the judges, particularly in the inferior courts, were wretchedly paid. That princess increased their salaries; but they are still far too low. And seeing that the judges are removable at pleasure, and owe their situation to favour rather than to merit, we need not wonder that the greatest abuses continue to exist in the administration of justice. The proceedings are dilatory in the extreme. The prohibition against taking fees from suitors is rarely complied with; and in most tribunals it is affirmed, that if justice cannot be altogether defeated, it may at least be indefinitely postponed, by dint of money. These abuses have, however, been, in part, at least, obviated by the publication, between 1826 and 1833, by the Legislative Commission, of an extensive digest (*Svod Zakonow*, "Body

of Law") of all the laws then in force relative to the rights of citizens and the administration of public justice. This publication has greatly simplified the law; and it is of vast importance from its being, as it were, a charter of rights which may be appealed to on all future occasions, and which it will be very difficult for any succeeding sovereign to abridge. But it would, notwithstanding, be idle to expect any very material improvement in the ordinary administration of justice, until the judges be better trained, selected, and paid; and till the influence of public opinion, and of a comparatively free press, neither of which has at present any existence in Russia, be brought to bear on the administration of justice, and of public affairs generally. The latter, in fact, is the only security against abuse on which any reliance can safely be placed. Wherever judges are exempted from the control of public opinion, and the animadversion of the press, they are most commonly the obsequious instruments of government, and seldom scruple to commit injustice when they believe it will be acceptable to their superiors.

There is in Russia, particularly in the great towns, a very efficient system of police. The officers are empowered to discharge various functions besides those which come more peculiarly within their province; such as the decision of differences between masters and servants, &c. Crime is not frequent in Russia; and property is as well protected in it as in any other country. Houses being generally built of wood, fires in great towns are apt to be very destructive; and the most effectual precautions are taken to prevent their occurrence. All strangers arriving in Russia must produce their passports at the police office, and notify their arrival in the public papers.

Punishments.—Capital punishments are rare in Russia, treason being the only crime visited with death. In cases of murder, fire raising, and other capital offences, the criminal, after receiving a certain number of lashes from the knout (a heavy thong whip), under the infliction of which he sometimes expires, is condemned for life to forced labour in the mines of Siberia. This part of the legislation of Russia has been the theme of much, though, as it appears to us, of little deserved eulogy. We agree with Mr. Coxe, that the fear of death is to most men the most efficient check on the commission of crime; and though it were conceded that Russian malefactors undergo a much severer punishment, still, as people generally know nothing of it, it makes no impression on them, and has little or no influence in deterring others from committing similar offences. (See *Coxe's Travels in Russia*, &c. iii. 116.) The nostrils of criminals used also to be slit, and their face branded with a red-hot iron previously to their banishment to Siberia; but this needless aggravation of punishment was put an end to by the Emperor Alexander.

Torture was formerly universal in Russia, and was inflicted at the discretion of the superior justices in all parts of the country, by whom, as was to be expected, the power was often shamefully abused. Russia is indebted to the Empress Catherine for the abolition of this atrocious practice. And it is a singular fact, and worthy of the attention of those who are so fond of recommending immediate changes, that the prejudice of the Russians, in regard to the necessity of torture, was so deeply rooted that Catherine had to proceed with great caution in bringing about its abolition, which was effected rather by indirect than by direct means. (*Coxe, ubi supra.*)

According to an official return there were, on the 1st of Jan., 1835, 97,121 criminals in Siberia, of whom 23,264 were females. Of the convicts, about 10,000 are condemned to forced labour in the mines, and otherwise; the others being mostly employed in agriculture. The greatest criminals, or (according to the interpretation of the Russian government), those sent thither for political offences, are mostly confined in N.E. Siberia, the climate of which is especially severe. The desertions amount to about 2,000 a year.

Division of the People into Classes.—The people of Russia are divided into four classes, viz. 1. nobles, 2. clergy, 3. burghers, merchants, and other farmers, and 4. the peasants, or slaves.

1. **Nobles.**—Previously to the reign of Peter the Great, the Russian nobility consisted principally of the descendants of the ancient petty princes of the country, or of lords possessed of vast estates. They were in the exclusive possession of all situations of trust and emolument, to which they succeeded according to their rank. Peter, who early saw the disadvantage of this state of things, and the necessity of undermining the influence of the nobles, most of whom were violently opposed to his projects for the regeneration of the country, had recourse, in furtherance of his plans, to the scheme of creating a new order of nobility. In this view he divided all the civil and military functionaries in the service of the state into 14 classes, enacting, at the same time, that the 8 highest classes should confer on the individuals in them the dis-

inction of hereditary nobility; that some of the other classes should confer the distinction of personal nobility, or of nobility for life; and that those enrolled in the others should be deemed gentlemen, or *biens nés*. Some modifications were made in this arrangement by the empress Catherine II.; but it is still maintained nearly as it was contrived by Peter the Great.

The creation of a new nobility founded on merit, or on services rendered to the state, was, no doubt, a material improvement at the time. By illustrating many new families, it has served to lessen the influence of the old nobility, and to liberalise the order, at the same time that it has opened a prospect to all enterprising individuals of rising to the highest dignities. On the whole, however, it would seem that the system having served its purpose, might now be advantageously abandoned. "*En grossissant*," says M. Schnitzler, "*à l'infini, le corps de la noblesse, ne nuit-il pas à cette institution peut-être nécessaire; et en depouillant le tiers état de tout ce qu'il a des citoyens distingués, n'affaiblit-il pas la considération dont il serait juste et utile d'entourer la classe laborieuse? N'enlevait-il pas à jamais aux arts et à l'industrie des hommes capables, qui auraient contribué à leurs succès, s'ils n'avaient pas eu à soutenir un rôle nouveau, et qu'ils ne craignissent de déroger à un rang auquel des longs efforts et les travaux de leurs pères les ont enfin élevés, en se livrant à des occupations qu'on regarde comme stériles?*" (*Statistique Générale*, p. 244.)

According to the official accounts, the order of the nobility comprised, in 1836, 691,355 individuals, of whom 538,160 enjoyed hereditary and the others personal dignities. In Russia, properly so called, the nobles are not numerous; but they abound in Podolia, Volhynia, and other provinces acquired from Poland, and especially in Poland itself, which, in 1837, had 283,420 nobles! Few, however, of the latter possess estates, and many of them are in a very destitute condition. In the Polish provinces, and in Courland, Livonia, and Esthonia, none but nobles can inherit landed property; but this is not the case in Russia Proper, though, with the exception of the crown estates, they are, in fact, almost the sole proprietors. The titles of prince, count, and baron have superseded those formerly in use. In the government of Tula, there are said to be more than 100 families having the dignity of prince. All the members of noble families are noble and have the same title as the head of the family. On the death of a noble person, his estate is divided, according to a fixed scale, (see *ante*, p. 610.), among his children of both sexes. Nobles are exempted from all personal charges, and from the obligation to serve in the army, but they are obliged to furnish recruits according to the number of their vassals. Nobles are also exempted from corporeal punishment; have leave to distil all the spirits required for the consumption of their establishments; may engage in manufactures or trade; have a right to all the minerals on their estates, &c. Precedence is determined, in Russia, by military rank; and an ensign would take the *pas* of a nobleman not enrolled in the army, or occupying some situation giving military rank. (*Schnitzler, Essai d'une Statistique*, &c., p. 112., &c.)

The property of a noble who has been condemned is not confiscated by the state, but goes to his family. The nobles also elect various local magistrates, assessors, &c., and deliberate at their meetings on various matters connected with the local administration. There is also in every government a committee of nobles to watch over the interests of the body, and to take care of the establishments that belong to it; and every circle has a committee of nobles who manage the estates and affairs of nobles who are under age. These privileges, which are obviously of considerable importance, were embodied and set forth in a ukase in 1762; and another ukase of the Emperor Alexander prohibits all government functionaries from interfering with the election of the assessors, and other functionaries chosen by the nobles.

It is not easy to form a fair estimate of the character of the Russian nobles. Generally speaking, their education is more superficial than solid; but many are, nevertheless, highly accomplished; they are all well acquainted with French, and numbers with the English and German languages; those who have travelled being distinguished by the superior polish and elegance of their manners. They are universally hospitable; and most of them affect, and many relish, the society of literary men and artists. That they are more sensual, more given to ostentatious display, and less distinguished by a gentlemanly bearing towards their inferiors, than the higher classes in England or France, is, no doubt, true. But the representations of their manners and conduct, given by Clarke, Lyall, and other travellers, of their caste, are, notwithstanding, mere vulgar caricatures, which though they may, perhaps, apply to a few individuals, are generally quite as wide of the truth as M. Pillot's accounts of our fair countrywomen. Considering, indeed, that the Russian nobility, have no exciting political occupation,

The dress of the peasant consists of a long coarse drugget coat, fastened by a belt round the waist, but in winter they wear a sheep-skin with the woolly side inwards. Their trowsers are of coarse linen; instead of stockings, woollen or flannel cloth is wrapped round the legs, and boots or shoes of matted linden bark are frequently substituted for those of leather. The neck, even in winter, is bare*, and the head is covered by a peaked round hat or cap. (*Voyage de deux Français dans le Nord de l'Europe*, tom. iv. p. 323.)

The Russian peasant considers himself well fed if he have rye-bread, which is the staple article of food throughout the empire, and sour cabbage soup, with a lump of fat, or hogs'-lard, boiled in it, by way of relish. He uses butchers' meat on holidays, and at other times eggs, salt-fish, bacon, lard, and mushrooms, which, at the proper season, are extremely abundant, onions, &c. His favourite dish is a hodge-podge of salt or fresh meat, groats, and rye-flour, highly seasoned with onions and garlic. Salted cucumbers are a constant dish at the peasant's table all the year round. These and salted cabbages form an important article of national commerce. They are brought in large rats from the southern provinces, where the climate favours their production, to Moscow, Petersburg, and other large towns, and here they are constantly on sale in the public markets. The preparation, in autumn, of a sufficient supply of these pickled vegetables forming, in every family, an important part of domestic economy. This dependence of the Russian peasant on vegetable diet is, no doubt, a consequence of the extraordinary number of fasts and fast-days, of which he is a careful observer, and which are multiplied to such an absurd extreme, that it is said there are only from 60 to 70 days in the year on which it is permitted to use butchers' meat. *Quas*, a fermented liquor, made by pouring boiling water on rye or barley-meal, is the common beverage of the peasant. But he is also very fond of mead, and still more so of corn brandy, and other spirituous liquors. The consumption of the latter is immense, exceeding 80,000,000 gallons a year, and furnishing annually a large revenue to government. The use of tea is becoming more and more extended. A substitute for it, called *izbitzen*, consisting of herbs, honey, &c. boiled together, is also extensively used by the peasantry.

The peasants are exceedingly superstitious. A vessel of holy water hangs from the ceiling of every room, and a lamp lighted on particular occasions. Every house is provided with a sacred corner, supplied with one or more pictures of their tutelary saints, coarsely daubed on wood, frequently resembling rather a Calmuc idol than a human head; but sometimes they are of a better quality, and neatly framed: to these they pay the highest marks of veneration. All the members of the family, the moment they rise in the morning, and before they retire to sleep in the evening, never omit their adoration to the saints: they cross themselves during several minutes, upon the sides and forehead, bow very low, and sometimes even prostrate themselves on the ground. Every person, also, on entering the room, pays his obeisance to these objects of worship previously to his addressing himself to the family.

The Russian peasantry have the vices incident to their situation. With a great capacity of endurance, and the most extraordinary talent for instruction, they have but little active vigour or steadiness of purpose. In accosting a person of consequence, or from whom they expect any favour or advantage, they prostrate themselves, touch the ground with their hands, and kiss the fringe of his garments. Their insecure position makes them anxious to enjoy the present moment; and their masters being obliged to provide for their support when they become old and infirm, they have little motive to providence or forethought. When they accumulate money, they most frequently bury it in the ground; a practice common to all countries where property is insecure.

The peasantry belonging to the richer nobles are, speaking generally, in all respects, much better off than those who belong to the class of poor and petty nobles; and, unfortunately for the peasants, the number of the latter is rapidly increasing by the subdivision of estates in every successive generation, and the constant augmentation of the nobility, from the influx into its ranks of individuals in the civil and military service. In 1822, however, the evil resulting to the peasantry from this state of things was partially obviated by restricting the right to purchase slaves to nobles possessed of a certain amount of property.

Previously to the reign of Peter the Great, it was customary for the Russians, of all ranks, to marry their children very early, even before the age of puberty. Though restrained by Peter and Catherine II., this custom of early marriage still prevails, and is said to be fraught with many pernicious consequences. A ukase issued in

1801, prohibits priests from solemnizing marriages, unless the man be 18 and the woman 16 years old.

The use of the vapour bath is universal in Russia, not being reckoned a luxury but a necessary; and public baths are met with in all parts of the country. They are resorted to by the peasantry, at least, once a week. Though the baths are highly heated, the bathers not unfrequently run out and in summer plunge into cold water, or, if it be winter, roll themselves in the snow! This sudden alternation of temperature is not found to be injurious to health. But, notwithstanding the frequent use of the bath, the boors are very deficient in cleanliness. (See *Coxe*, 5th ed. i. 269.; *Schnitzler*, *Essai d'une Statistique Générale*, passim.; *Voyage de deux Français au Nord de l'Europe*, iv. 318—332; *Pinkerton's Russia*, pp. 69—80, &c.; *Foreign Communications on the Poor Laws*, p. 330, &c.)

Army.—The military power of Russia having been ridiculously exaggerated by some, and as ridiculously depreciated by others, deserves to be inquired into with some attention. The Strelitzes, the first regularly organized corps of infantry in the Russian service, seems to have had their origin about the middle of the 16th century; and continued, till their suppression by Peter the Great, to constitute the principal strength of the army. They enjoyed various privileges; were always about the person of the emperor; and, by their licentiousness and insubordination, as well as bravery, bore a close resemblance to the Prætorian bands of antiquity, and the Janissaries of the Ottoman Porte. The abolition of this formidable corps, and the reconstruction of the army on a plan similar to that followed in the more civilized countries of Europe, was undoubtedly one of the greatest services rendered by Peter the Great. At his death, the regular army amounted to about 110,000, exclusive of the imperial guard; and the success which attended his contest with the Swedes showed that this army was a match for the best troops that could then be opposed to it.

Under Catherine II., the army was greatly augmented and improved. This able and ambitious princess augmented the pay of the troops and officers, and gave them a new, more commodious, and elegant uniform than that formerly in use. She formed the Cossacks into a light cavalry, which, after being successfully opposed to the Spahis of the Turks, has since distinguished itself in the great contests of more modern times. During the latter part of the reign of Catherine the regular army amounted to about 250,000 men; and little was wanting to place it on a level with that of the surrounding powers, save the better organization of the commissariat department, and the choice of better educated and more skilful native officers.

It is, however, to the emperors Alexander and Nicholas that the Russian army is indebted for the more efficient organization, discipline, and power by which it is now distinguished. The momentous struggles in which the former was engaged called forth all the military resources of the empire; many abuses were rectified, and improvements introduced; and the armies of Alexander were at length enabled to contend successfully with those of the greatest captain of the age. Under the present emperor, the discipline and organization of the army have been still further improved; and it is, at present, in a comparatively high state of efficiency.

The Russian army has been newly organized, by a ukase of the 9th August, 1835. Down to that period, two large armies were maintained; but those were then consolidated, and the staff of one of them reduced. The army is now divided into six *corps d'armée* of infantry, each corps into three divisions, each division into two brigades, each brigade into two regiments, and each regiment into six battalions of 1,000 men each; four battalions take the field, and two remain as a reserve; so that each regiment, in fact, is 4,000 strong, and each *corps d'armée* 48,000 strong. To each of these six corps there is attached one division of light horse, in two brigades (Hussars and Huhlands) of two regiments each. Each regiment of horse consists of nine squadrons of 160 horses each, eight of which take the field, and one remains as a reserve; so that a regiment in the field has 1,280, and a division 5,120 horses. Besides this, each corps has a division of artillery united to it, consisting of three brigades, with four batteries each of eight guns, and one brigade of horse artillery, one reserved battery, one park of artillery, and three sapper battalions, together 6,000 men. Thus a complete *corps d'armée* is 60,000 men strong, with 120 pieces of artillery; and the whole active army 360,000 men, and 720 pieces of artillery. Then comes the corps of guards, in three divisions of infantry, three divisions of cavalry, and one division of artillery, with 120 guns; then the grenadier corps, equal in strength to an infantry corps; both together 114,000 men, and 240 guns. There are two reserved corps of cavalry, each of two divisions (Huhlands and Cuirassiers), each division of two brigades of two regiments each, with two brigades of horse artillery, and a dragoon corps in two brigades of two regi-

* This, according to the intelligent author of the *Voyage de deux Français*, is a decisive criterion by which to distinguish the genuine Russians.

ments each, and one brigade of horse artillery : altogether this cavalry corps consists of 30,000 men and horses. Finally, there are two independent *corps d'armée*, of the Caucasus and Siberia, the first equal in strength to a whole corps, the latter to half a one ; so that the entire strength of the regular army in time of peace amounts to 594,000 men ; which, at present, is equal to one per cent. of the population, as the Asiatics, and particularly those tribes who serve as irregular troops, are not included in this account. (*Supp. to the Conversations Lexicon of Gegenwart*, Engl. trans. p. 198.)

But exclusive of the above, the troops not of the line, or those forming the irregular army, constitute a very formidable force. They consist, 1st, of upwards of 50,000 men in garrison in different parts of the interior, and along the frontier ; 2d, of above 100,000 veterans, mostly employed for the same purpose ; and 3d, of the irregular Cossack cavalry, and the colonized regiments.

The really effective force of the Russian army may, therefore, be reckoned at about 600,000 men ; but from this various deductions must be made. Two out of the six battalions of the different regiments are almost always absent, constituting, in fact, *dépôts*, being employed in public works, in the conveyance and training of recruits, &c. It is believed, too, that the forces actually embodied rarely come up to the returns ; the officers being driven, by the inadequacy of their allowances, to add to their means of subsistence by keeping up vacancies in the ranks. And if, in addition to these various causes of deduction, we bear in mind that Russia must always, in the event of her being engaged in foreign war, keep a large amount of forces at home to guard the frontiers, and to maintain tranquillity in Poland and other disaffected provinces, it will be seen that, at present, she could have considerable difficulty in marching 200,000, or even 150,000 men across the frontier. When Napoleon invaded Russia in 1812, the entire force brought to oppose him scarcely exceeded 200,000 men. During the last war in Turkey, the invading army did not exceed 120,000. Even if the troops really at the disposal of government corresponded with those in the official returns, Russia could find great difficulty in sending large armies into distant countries, and maintaining them when there. Her finances are far from being in a flourishing state ; owing to the abuses that prevail in her commissariat department, a great expenditure is incurred at the same time that the troops are often very ill-provided with the most indispensable necessaries.

At home, however, Russia is all but invulnerable. The severity of the climate renders it next to impossible for an invading army to maintain any permanent footing in the country ; whilst the nature of the ground, without being so difficult as in the West, is, and intersected with forests, rivers, and marshes, presents the greatest obstacles to the advance of an invading force, and still more to its retreat. Even though the army of Napoleon had not had to contend with the rigors of an unusually early winter, the result of his expedition could not have been materially different. He could not possibly have maintained himself during the winter at Moscow. Sooner or later he must have retreated ; and a retreat through such a country, and in the presence of a powerful enemy, ready to take every opportunity of attacking, could not fail to be most disastrous. The troops of the Imperial Guard are a very fine body of men. Generally the Russian soldiers are, in respect of physical vigour, inferior, perhaps, to those of England. They have no enthusiasm ; and in respect of activity and intelligence, are very far below those of England, France, and Prussia. On the other hand, however, they possess, in the greatest perfection, the two first requisites of a soldier ; the most unflinching courage, and the most implicit obedience. Subjected from birth to a discipline whose will is their law, the habit of prompt and absolute obedience becomes, as it were, a part of themselves.

Regardless of dangers or difficulties, they will do whatever they are ordered ; and will accomplish the most undaunted resolution and perseverance in the most arduous and dangerous service. They also endure, without a murmur, the most hardships and privations, and support themselves in situations where others would starve. The Bashkirs, and other irregular cavalry, are brave troops, and are well calculated either to insure victory or to cover a retreat. Contrary to what has been expected, the artillery is the department in which the Russians have made the greatest advances ; and is said to be in excess as compared with the other arms of force. Were the officers as intelligent and brave as the soldiers are brave and docile, the Russian army would be most formidable. But this is far from being the case. Lately, however, great efforts have been made to improve the education of the officers, and, in addition to the establishments for that purpose existing below, a military academy was opened at St. Petersburg in 1832, where officers not above the grade of captain are instructed in military service ; and in 1837 a school for 400 cadets for the artillery and engineers was opened at Woronesch. The pay of the officers, though

still miserably low, has been increased ; and the present emperor has endeavoured to excite the martial spirit of the people, and to make the service popular, by instituting grand military spectacles. Some of these have been on a gigantic scale. At the grand military and religious festival in commemoration of the battle of Borodino, in 1839, no fewer than 120,000 troops were present ! Marshal Marmont has spoken in high terms of the efficiency and discipline of the Russian forces he reviewed in the S. provinces in 1834.

Recruiting.—The army is recruited from the classes of peasants and artisans, every individual belonging to them being liable to compulsory service, provided he be of the proper age and stature. The levies are ordinarily in the proportion of 1 or 2 to every 500 males ; but during war the proportion is at least as 2 or 3 to 500, and sometimes as much as 4 or even 5 to 500. This last proportion, however, of that of 5 to 500 males, may be taken as the *maximum* levy, and is rarely exceeded. The number of recruits to be furnished by the empire in general, and by each district in particular, is fixed according to the results of the preceding census. The nobles nominate such of their serfs as they please to complete their quotas, the only conditions being that they should have a good constitution, and be of the requisite size, and not less than 18 nor more than 40 years of age ; and, as idle, ill-disposed individuals are sure to be nominated in preference for recruits, those who are averse from the service endeavour to distinguish themselves by industry and good conduct. The *minimum* standard height for infantry is not less than 1 mètre 594 millimètres ; and for cavalry, 1 mètre 660 millimètres. The recruits are first sent to the recruiting establishments, and thence forwarded to the corps to which they are assigned. Nobles, magistrates, clergymen, and students are exempted from the service. Merchants and traders enrolled in the different guilds are also exempted ; the levies furnished by the Cossacks are regulated by particular treaties ; and many half savage tribes are excused, partly on account of their diminutive size, and partly because of their great aversion to a military life. Generally, it is found that a levy of 2 on every 500 males produces a supply of about 90,000 or 100,000 men. Substitutes are allowed, and may be effected by mutual consent, provided the noble be informed, and do not oppose it.

A ukase of the 3 (15) Sept. 1837 fixes the period of service at 20 years in the Imperial guard, and 22 in the other corps. Every individual, with his family, if he have one, becomes free the moment he is enrolled in the ranks of the army. In case of desertion, he is again enslaved ; but desertion is exceedingly rare in Russia.

The guard is recruited from the grenadiers ; the latter from the infantry of the line and light chasseurs.

Promotion.—After two years' service a soldier may become a sub-officer. The sub-officer who has served twelve years obtains of right the rank of sub-lieutenant or ensign.

Children of soldiers are educated at public military schools, or at schools belonging to the regiment : those who pass their examination with credit become sub-officers. There are at Petersburg schools for pages, engineers, officers of artillery, sub-officers of the guard, &c. ; the rank of ensign being given to pages who have gone through a certain course, and to gentlemen cadets who have been two years in the service. But the principal establishment for the education of officers is that of the *Corps des Cadets* at Petersburg, founded in 1731. It has about 700 pupils, the sons of noble parents, that is, of those who have attained to the rank of captain in the civil or military service. The pupils are divided into five classes, and on leaving school become ensigns in regiments of the line. This school has materially contributed to diffuse information among the inferior nobility, and to supply the army with able officers. There are also schools for cadets at Moscow, Woronesch, Polotsk, Tula, Tamboff, and other towns. The pupils leave after a fixed time, and are ranked as ensigns.

During peace promotion depends upon seniority, from the rank of ensign to that of colonel : during war it is determined indifferently, by gallantry, selection, and seniority.

Pay, &c.—The Russian army is supported at very little expense. Exclusive of their pay, the higher class of officers receive considerable allowances, as mess-money, &c. ; and they generally contrive to eke out their emoluments in various indirect ways. The pay of the subalterns is the most inadequate ; and it is hardly possible for any one to serve as a subaltern in the cavalry, especially in the cavalry of the guard, unless he have private resources. Officers are allowed, according to their rank, one or more servants (*deutchiks*), maintained by government, but equipped at the expense of their masters. They are taken from among the recruits, the least suitable for active service. The pay of a common Russian soldier does not exceed 25s. a year ! and various deductions are made even from this miserable

pittance. He gets a new uniform each year; and is allowed, in addition, 3 barrels of flour, 24 lbs. of salt, and a certain quantity of rye or oatmeal. On fête days the soldiers of the guard receive a certain allowance of butchers' meat, but this is very rarely tasted by their fellows. At home the soldier is paid in paper; but when he crosses the frontier he is paid in silver roubles; and as one of the latter is equivalent to four of the former, his pay, when abroad, is, of course, augmented in the same proportion. This may, perhaps, have been partly intended as a stimulus to the soldier to undertake offensive operations; but, besides having this effect, it was absolutely necessary, to enable him to subsist among foreigners without robbing. The cavalry horses are very good; and, fodder being very cheap, they are well kept.

Soldiers leaving the army on the expiration of their compulsory service are entitled to a small pension; and those who have been maimed or wounded are received and supported in some of the hospitals established in that view in different parts of the country. Soldiers who continue in the army after their term of compulsory service has expired acquire several advantages. They receive, exclusive of the retiring pension to which they are entitled, double pay; and after five years' voluntary service they are entitled to a retiring pension equal to three times their original full pay.

The inadequate pay of the officers and men is the grand evil in relation to the Russian army. It compels all classes to resort to underhand methods of making money; and hence the jobbing and corruption of the first, and the thievish habits of the latter. Government is plundered in every possible way; and while the army loses in strength and efficiency, it may be questioned whether it would not be more advantageous, even in a pecuniary point of view, for government to increase the pay of the officers and troops, so as to raise them above the necessity of indulging in practices injurious to the service, of the existence of which it is well aware, but at which, as matters now stand, it is obliged to wink.

Capital punishments are at all times rare in the Russian army, and are never inflicted except during war. During peace culprits are uniformly condemned to transportation to Siberia, and to forced labour in the mines. Corporeal punishments may be ordered by the commanding officers of regiments, but they cannot be carried beyond twenty strokes of the knout, and are not to be inflicted except for very grave offences. Soldiers who continue in the army after their full period of compulsory service is exhausted cannot be corporeally punished except by command of a council of war.

Military Colonies.—Exclusive of her ordinary forces, Russia has a considerable force of military colonists. These are a sort of agricultural soldiers established by a ukase issued in 1818, agreeably to the suggestion of General Arakhtief. The object was to create a military force at the least possible expense, by engrafting military service upon the agricultural labours of the peasants. For this purpose certain districts belonging to the crown were selected in the environs of the lake Ilmen, in the government of Novgorod, and in some of the southern governments, the territory of which was distributed among the peasantry, at the rate of about 15 deciatines, or 45 acres of arable land to each head of a family, villages on an improved and uniform plan being at the same time erected for their accommodation. The stock and implements necessary for the cultivation of this land are furnished to the colonist by the crown, and he is charged with its cultivation, with contributing to the common magazine of the village, keeping up the roads, &c.; the surplus produce, after these outgoings and the provision for his family are deducted, being at his disposal. A soldier is assigned to each colonist, to be maintained by the latter; but the soldier is, in return, obliged, when not absent or engaged in duty, to assist the colonist in the labours of his farm. The colonists, as well as the soldiery, are deprived of their beards, and wear uniform, every thing within the colony being subject to military regulation: there is no restraint on the marriage of the soldiers; and their male children, and those of the colonists, are all bred up to be soldiers. The girls are educated in separate schools; and, though there be no regulation to that effect, are generally married to the young men belonging to the colonies. Exclusive of the principal soldiers already alluded to, there is in every cottage a substitute or supplementary soldier, generally a son of the colonist, who is bound to take the place of the principal soldier in the event of his death or sickness, so that the regiments distributed among the colonies can never want their full complement of men.

The colonies may contain in all from 50,000 to 60,000 troops; but, notwithstanding what Marshal Marmont has stated to the contrary, the experiment is now generally regarded as a failure. It will always, indeed, be found to be impossible successfully to combine the business of agriculture with the military service. The soldiers get attached to their farms and families, and be-

come unwilling to leave them and impatient of military restraint. Few, indeed, at all familiar with such subjects, will be surprised to learn that considerable discontent has, at different times, prevailed among the colonies in question. A dangerous mutiny, in which several officers lost their slaves, was not suppressed except by the presence of the emperor, who discovered on this occasion his usual courage and decision. Indeed, the general opinion is that the military colonies will be gradually abandoned.

Navy.—Russia has a very considerable naval force, the fleet comprising about 50 ships of the line, 25 frigates, 10 steam ships, and about 600 smaller vessels. She is indebted for her naval power, as she is for her ascendancy by land, her civilization, and, indeed, every thing else, to the creative genius of Peter the Great. Previously to his accession, Russia had no sea-port, other than Archangel, and did not possess a single gun-boat. As soon, however, as Peter had acquired a footing on the Baltic, he set about creating a navy; and the better to qualify himself for the task of its construction, he visited Holland, where he not only made himself acquainted with the principles of naval architecture, but with the practical business of a ship's carpenter, by working himself at this employment! The monarchs since Peter, and especially Catherine II. and the present emperor, have all exerted themselves to increase and improve the fleet; and it is now, perhaps, in as high a state of efficiency as it is likely to attain.

The truth, however, is, that though the naval force of Russia be sufficient to give her an overwhelming influence in the three inland seas connected with her empire, or in the Baltic, the Black Sea, and the Caspian, it is not in the nature of things that she should ever be able to cope with the maritime powers situated on the ocean. The Baltic, in fact, affords no proper field for the training and exercise of a fleet. Besides being limited in extent, it is frozen over for half the year; during all which time the ships have to be laid up; and the crews being on shore, cannot possibly attain that skill in seamanship, and dexterity in manœuvring, that is attained by sailors constantly afloat. And, by a singular contradiction, instead of attempting to obviate this state of things, and sending squadrons into the open seas, and keeping them afloat all year, it is a rule of the Russian service, that every third year the seamen, if so we may call them, shall not go to sea at all! Nothing, therefore, can be more idle and unfounded, than the statements so frequently put forth as to the danger to be apprehended from the increasing naval power of Russia. Such dangers are wholly imaginary. The physical circumstances under which she is placed must always prevent her from becoming a great naval power. She is superior, by far, to any other power on the Baltic, the Black Sea, or the Caspian; but there her ascendancy naturally stops; and any attempt on her part to construct fleets to cope with the maritime powers, properly so called, would be a most absurd and improvident waste of the national resources.

Russian ships, both in the Baltic and Black Sea, last but a very short time, and, consequently, are very expensive. The great naval stations are Cronstadt, in the Gulph of Finland, and Sevastopol, in the Black Sea.

Education in Russia is at a very low ebb. There have for more than a century been schools in all the great towns; but these are but few in number; and the rural population is too much dispersed, even if it were not enslaved, and tied down to routine practices, to allow it to reap much benefit from country schools. But, notwithstanding the difficulties in its way, education is making progress, and has been much improved and extended within the present century. It has always been, and continues to be, an object of great solicitude with the government. A plan for a national system of instruction was laid down in a ukase of the Emperor Alexander, issued in 1802; which, though it has undergone various modifications, contains the outline of the system that is still followed. The empire is divided in respect of education into a certain number of districts, each of which has, or is intended to have, a university, with a certain number of lyceums (at which the young men intended to fill civil offices are mostly instructed), gymnasiums, high schools and elementary schools, varying according to its extent and population. At present the districts are those of Petersburg, Moscow, Kharkof, Kasan, Dorpat, Kieff, Helsingfors, Odessa, White Russia, the Transcaucasian provinces, and Siberia; but of these only the first seven have universities. A curator, or inspector, is placed at the head of each district, who is in constant communication with the minister of public instruction. The subjects and courses of study, the examinations to be gone through, the fees to be paid, &c. are all fixed by government. The sum placed annually at the disposal of the minister of public instruction amounts to above 3 millions roubles.

The Report of the minister of public instruction to the emperor, at the close of 1835, gives various details as

are the most distinguished of those intended for the instruction of nobles. In the first there are about 300 boarders, paid for by their parents; the rest attending as day-scholars. The first class pay 32*l.* a year, and the second 24*l.* (*Pinkerton's Russia*, p. 256.)

The pedagogical institution of Petersburg is one of the most important and valuable in the empire. It is exclusively appropriated to the education and training of schoolmasters. In 1835 it had 45 functionaries and 144 pupils.

Young men belonging to great families used formerly to be, for the most part, educated at home by foreign tutors, of whom not a few were ignorant, unprincipled, and servile. But an edict of the emperor Alexander contributed to subvert this practice, by excluding all young men, not educated at a public seminary, from the higher class of public employments; and, as already seen, it has been still farther discouraged by the present emperor.

Races.—The Russian empire embraces at present an immense variety of different races; but the great bulk of the nation, or the Russians properly so called, with the Poles, and also the Bulgarians and Servians, belong to the great Slavonic family. The Slavonians are most generally supposed to be the descendants of the *Sarmatæ* of antiquity; but, though probable, this is by no means certain. At all events, they are radically distinct from the Goths, on the one hand, and from the Tartars and other Eastern nations, on the other. There is no foundation whatever for the common opinion that they were denominated Slavonians from their being originally slaves. On the contrary, when first known to history, the Slavonians were as free as the Goths. The practice of slavery was gradually introduced; and in Russia it was not completed till the beginning of last century. (See Dr. Pinkerton's *Russia*, p. 276., and the authorities there referred to.) The individuals of Slavonic origin at present within the limits of the Russian empire are supposed to amount to about 46,000,000, being about three fourths of the entire pop.

The next principal race is that of the Ourallians or Finns, inhabiting the grand duchy of Finland, Esthonia, Lapland, and several districts in the north of the empire. The Finnish population is believed to amount, in all, to above 2,000,000 individuals. The Letto-Lithuanian race, amounting to nearly 2,000,000, is principally found in Lithuania and the W. parts. There are, also, about 2,000,000 Tartars; 2,000,000 Georgians, Armenians, &c. The Germans settled in various parts of the empire may be taken at about 450,000; and there are, besides, 1,064,000 Jews, with Samoyedes, Mongolians, Kamchatskades, Americans, &c.

Language.—Those who are aware of the various races and the numbers of different people included within the Russian empire, need not be surprised that about *forty* distinct languages are in use, having attached to them an immense number of different dialects. The individuals belonging to the Slavonic race have two languages—the Russian and the Polish, both derived from the ancient Slavonic. This mother-tongue, augmented and modified by the influence of Christianity, which introduced into it a number of Greek words, and by the dominion of the Tartars, by whom it was loaded with Turkish and Mongolian terms, was gradually formed into the Russian. The primitive idiom continued, however, to be employed in the liturgy and the sciences till the reign of Peter the Great, when the Russian gained that ascendancy in religion and science it had already gained in conversation. The extraordinary advances that were then made in civilisation occasioned the introduction of an immense number of new words. At length the language became tolerably well fixed. The alphabet, which consisted originally of 45, has been reduced to 37 letters, some of them borrowed from the Greek and others from the Latin. Some characters are, however, quite unlike those of any other language, and can hardly be pronounced by any save Slavonians. The grammatical forms are not well defined, and the conjugations are exceedingly irregular. Otherwise the language is rich, sonorous, flexible, natural, and elegant. The variety of its terminations is very remarkable. There is very little *patois* in Russia; the language of the country differing but little from that of the towns. There are, however, three principal dialects; 1st, the *Great-Russian*, the pure or cultivated language of the nation, spoken in Moscow, and all the central parts of European Russia; 2d, the *Malo-Russian*, or language of the S.E. parts of Russia in Europe; and 3d, the *White-Russian*, or dialect spoken in Lithuania, Volhynia, &c. It is a curious fact, that the first grammar of the Russian language appeared at Oxford in 1696. The best grammar is that of Dobrowski, published at Vienna in 1822. The Russian Academy has published a dictionary of the language in 6 vols. 4to., 1806—1822.

Literature.—Russia has had several distinguished natural philosophers and mathematicians, but they have been chiefly foreigners (Germans principally) resident in the country. At present the literature of Russia occupies

a respectable place in that of Europe. The introduction of Christianity was marked by the growth of a taste for letters among the ancient Slavonians; but the only remains of that early literature are some fragments of chivalrous poetry, and the annals of the monk Nestor. The Tartar invasion arrested the progress of literature, and Russia fell back into the abyss of barbarism, whence she did not begin to emerge till after the accession of the house of Romanoff. The attempts of the restorers of literature were at first confined to some feeble dramatic performances; and towards the close of the 17th and the beginning of the 18th centuries, to miserable imitations of French and other foreign works. In the course of the 18th century, however, Lomonosoff created, by his precepts and his example, a national literature. Soumarokoff carried the drama to a high degree of perfection, and since then a crowd of writers have distinguished themselves in all departments, from the *epopee* down to eclogue and fable; and the national literature continues to flourish with undiminished vigour. The History of Russia, by Karamzin, now in course of publication, is a work of great merit. Numerous journals or periodical publications, in different languages, devoted to politics, literature, and science, appear in different parts of the empire; but so long as these are subjected to a severe censorship, and as the government looks with jealousy on anything approaching to the expression of a free opinion, the political and philosophical works of Russian writers can be but little deserving of attention. The first Russian press was set up at Kieff in 1551. Previously to 1800, there had not been printed above 1,000 works in Russia; in 1807, the number of such works was about 4,000; in 1821, they amounted to 13,249, and at present (1840) to more than double this number, about a third part being translations from the French and other foreign languages.

Russia has some splendid libraries and museums. The imperial library at Petersburg contains about 400,000 vols. and 17,000 manuscripts; and the Romantzow Museum contains a large collection of national antiquities and of every kind of curiosities.

Religion.—Most religions to be found in the ancient continent have their adherents in Russia. The court, however, and the great body of the nation profess the Russo-Greek Christian faith, denominated by its votaries the orthodox or true Catholic faith. The points in which it principally differs from the Roman Catholic faith, are, its denying the spiritual supremacy of the pope, its prohibiting the celibacy of the clergy, and its authorising all individuals to read and study the Scriptures in their vernacular tongue. The prohibition of celibacy is carried to such an extent, that no priest can perform any spiritual function before he is married nor after he becomes a widower; and as he is not allowed to remarry, the death of his wife and the cessation of his functions as a priest (unless he be specially allowed by the bishop to continue them) are necessarily identical! The priests may, however, on the death of their wives, enter into a convent, and enjoy the barren privilege of becoming eligible to be dignitaries of the church. Pictures of saints are admitted into the Russo-Greek churches and houses; but all statues, bas reliefs, &c., are rigidly excluded. There are several fasts, of which that of Easter, which continues for seven weeks, is the longest and strictest. Divine service is performed in the native tongue; and singing in churches is unaccompanied by any sort of instrumental music. The total pop. professing the Russo-Greek faith may be estimated at about 50,000,000. No country in Europe possesses such a number of fine churches as Russia. The meanest village is generally furnished with a temple ornamented with gilt domes and spires. These edifices are nearly all in the Grecian style of architecture, substantially built of brick, plastered and painted with much taste, forming a striking contrast to the huts or izbus of the peasantry by which they are surrounded.

There are in all Russia nearly 500 cathedrals and about 29,000 churches attached to the established faith, the latter employing about 70,000 secular or parochial clergymen. There are also about 550 convents, of which 400 are for men and 70 for women. Adjoining to each church or near it, there is always a *kolokolnia* or belfry, commonly of great height, and provided with large bells, which are tolled several times during every service, and on holidays kept ringing the whole day. The Russians are passionately fond of the sound of bells, and larger and finer ones are nowhere to be found; every church has in its steeple four or five of different sizes; and in many this number is doubled and even trebled. (*Pinkerton's Russia*, p. 268., &c.)

The Russian church was long subordinate to that of the Eastern empire, its metropolitan being nominated by the patriarch of Constantinople. But after the capture of the latter city by the Turks in 1453, the Russian clergy appointed their own metropolitan. This practice continued till the reign of Peter the Great, who declared himself the head of the Russo-Greek

church, appointing, at the same time, a synod for the management of its affairs. The clergy are either secular or regular—the former consisting of the parochial clergy, and the latter of the higher dignitaries, monks, &c. The hierarchy is composed of bishops, archbishops, and metropolitans. There are in all thirty-eight dioceses.

In Russia, as in most other countries, the piety, or superstition of individuals, had conferred great wealth on the church, particularly on the monasteries. This having occasioned many abuses and irregularities, afforded a pretext, of which Peter the Great availed himself, not only to suppress various monasteries, but to deprive the church of the greater part of its wealth. In the reign of Catherine II., the degradation of the clergy was completed by the appropriation of the whole immoveable property of the church to the use of the state, pensions being assigned, in its stead, to the different functionaries to whom it had belonged. But, with the exception of a few livings in Petersburg, Moscow, and other principal cities, the stipends of the clergy, even when increased by the offerings of the people, and by the perquisites on occasion of births, marriages, funerals, &c., are quite inadequate to provide for their comfortable subsistence. The total number of established clergy, of all ranks and orders, may be taken at about 254,000; and the sum allowed as stipends by government is so very small, that they are almost wholly dependent on their flocks. The revenue even of the senior metropolitan, the highest dignitary in the hierarchy, did not recently exceed 600*l.* or 700*l.* a year; and an archimandrite, or abbot, the class next below a bishop, had not generally more than from 40*l.* to 50*l.* a year! (*Pinkerton's Russia*, p. 241.) Mr. Coxe says, that "besides the surplice fee, which in the poorest benefices amounts to 4*l.* a year, and is the most profitable to but 20*l.*, they have only a wooden house, scarcely superior to that of the meanest among their parishioners, and a small portion of land, which they generally cultivate with their own hands; while the highest dignity to which they can ever attain, so long as they continue married, is that of a prototype of a cathedral, whose income scarcely exceeds 20*l.* a year." (*Travels in Russia*, &c. lib. 143.)

When such is their depressed condition, we need not wonder at the low state of learning and want of refinement among the great bulk of the Russian parochial clergy. Coxe tells us, that when he was in Russia, many of the par. priests were so miserably ignorant as to be unable to read, even in their own language, the gospel which they were commissioned to preach! But, though still far behind, such gross ignorance is now much less common than formerly. The duties of the Russian clergy of all orders are very laborious. Dr. Pinkerton, whose authority is unquestionable, says, that we find in the daily circles of the secular or parochial clergy, a degree of culture and good manners peculiar to themselves. A description of clergymen wear long beards, and form, next, like the priests of old, a kind of distinct class, or order. None but the sons of clergymen are educated for the church; nor is there one instance in a thousand of one belonging to any other class entering the ranks of the secular clergy. The regular, or dignified clergy, on the contrary, though often the sons of priests, not frequently receive recruits from among the nobles and gentry; and all the higher stations in the church continue to be filled up from their ranks. (*Pinkerton's Russia*, p. 250.) Orders, and other marks of distinction conferred on the Russian clergy; and at present a person is little thought of unless he be decorated with an order and ribbon of some order of knighthood.

The Russo-Greek church has, from an early period, been divided into schisms and dissenters. The latter are said to amount to about 70 sects. They are classed under the general denomination of *raskolniks*. The ritual, or liturgy of the Russian church is contained in *twenty volumes*, in the Slavonic tongue!

With the exception of the restraints laid on the Jews, who are excluded from Russia Proper, almost all religions may be freely professed anywhere in the empire. The number of the Russo-Greek church is, however, declining, and many are ready to renounce his religion; and when a man takes place between one of its members and a member of another faith, the children must all be brought up in the established faith. Catholics are numerous in the Polish provs.; there are, also, numbers of Lutherans, chiefly in the Baltic provinces, with Mohammedans, Jews, worshippers of the sun, &c., &c.

Observations. — Owing to the low state of civilization in parts of the Russian empire, and the want of manufactures and great towns, the public revenue is not so great as might be supposed from the extent of the empire, and the magnitude of the population, however, of the cheapness of most necessaries in Russia, and the small rates of pay of officers and other public functionaries, her limited resources go a great way, and she is able to meet out-

goings that elsewhere could not be met with less than twice or three times the sum.

Most topics connected with the public revenue and expenditure, are involved in a mystery which it is not always possible to penetrate. The former is derived from a few sources, consisting of,

1. The capitation tax, charged on all the male boors belonging to individuals, and also on some descriptions of freemen. At an average it may be estimated at about 4 roubles a head; and estimating those subjected to it at 10,000,000, it will give 40,000,000 roubles.

2. The *Obrok*, or rent paid by all male boors on the crown estates. Estimating this tax at 10 roubles, and those subjected to it at 9,000,000, it will give a sum of 90,000,000.

3. The tax of 1*½* per cent. on the declared capital of the merchants. The amount of this tax may be taken at 8,000,000.

4. The customs' duties in 1839 produced very near 92,000,000 gross revenue. The expenses of collection amount to about 7*½* per cent. of this sum.

5. The spirit duties produce a very large sum. In Russia, properly so called, government reserves to itself a monopoly of distillation; but in the rest of the empire the produce of the distilleries, which any one may construct, is subjected to an excise duty. The consumption of spirits is very large; and the revenue thence arising may be estimated at 100,000,000. Among their other privileges the nobility may distil all the spirits required for their establishments free of duty.

6. The salt-mines and brine-springs are monopolized by government, which sells their produce at the rate of a rouble per pood. This monopoly is supposed to produce about 10,000,000 a year.

7. The crown mines, and the duties payable by the proprietors of private mines, produce together about 16,000,000.

8. The seignorage on coin may be taken at 8,000,000.

9. Stamps, licenses, &c., and the tax laid on the sale of immovable property, may be estimated at 7,000,000.

10. Miscellaneous items, such as the sums paid by the nobles to be exempted from furnishing recruits for the army, the rent of crown property let on lease, the profits of crown manufactures, &c., may be taken at 8,000,000.

Hence it may be concluded that the public revenue of the Russian empire amounts, in all, to 379,000,000 or 380,000,000 roubles a year, that is, to about 15,836,000*l.*

The taxes are partly farmed, and partly collected by government officers. There is, as already stated, in every government, a council charged with the administration of every thing relative to the finances.

Our information with respect to the expenditure is even less accurate than that respecting the income of Russia. In time of peace, however, they are understood to be nearly equal; but during war, or on extraordinary occasions involving an increase of expenditure, the ordinary revenue is quite insufficient to meet the outgoings, and it is usual both to increase the rate of taxation and to resort to loans. The expense of the army and navy (the latter being about one fifth or one sixth part of the former) amounts to more than half the revenue. The next great items are the interest and sinking fund on account of the public debt; the civil list, internal administration, public works, &c.; the diplomatic service, and various other items.

According to the report of the minister, M. Kankrin, the public debt amounted, in 1837, to 956,223,574 roubles.

Historical Sketch. — The ancients had very little acquaintance with the vast countries included in the empire of Russia. The monarchy is usually regarded as having been founded by Rurik about anno 862, his dominions, and those of his immediate successors, comprising Novgorod, Kieff, and the surrounding country. In 980-1015, Vladimir introduced Christianity, and founded several cities and schools. But, from this period down to 1237, when the country was overrun by the Tartars, Russia, with few exceptions, was the theatre of civil war. In 1228 the seat of government was transferred to Moscow; and in 1481 the Tartars were finally expelled. In 1613 the house of Romanoff, whence his present majesty is descended, was raised to the throne; and from this period the empire acquired strength and consistency. Under Alexis Mikhailovitch (1645-1676) White Russia and Little Russia were conquered from the Poles, and the Cossacks of the Ukraine acknowledged the supremacy of the Czar, various internal improvements were effected, and the power of Russia began to be felt and feared by all her neighbours. At length, in 1696, Peter the Great ascended the throne, and the destinies of Russia and of the northern world were immediately changed. This prince, who has, probably, a better claim than any other that ever existed to the epithets of "great" and of "father of his country," gave to the arms of Russia a decided preponderance in the north of Europe; he also gave her a fleet; conquered large provinces on the Baltic; laid the foundations of the noble city which bears his name; and introduced among

his people the arts, the literature, the customs, and, to some extent also, the laws and institutions of the more civilised European nations. The difficulties he had to encounter in his projects for remodelling and civilising his dominions were of the most formidable description; and could not have been overcome by any one possessed of less authority, or of a less stern decided character.

From this period Russia has progressively advanced in power and civilisation. Under Catherine II. (1762—1796), a princess of extraordinary talent, Russia acquired a vast accession of power by her acquisitions in Poland and on the Black Sea, where she has now the same ascendancy as in the Baltic. The history of Russia, during the present century, is known to everybody. The attempt of Napoleon to dictate a peace to the emperor Alexander, in the ancient capital of the Czars, led to the overthrow of his colossal power, and gave a vast accession of influence and consideration to Russia; which has been maintained and extended under the present emperor.

It would be idle to speculate upon the permanency of the present order of things in Russia. A great deal, in such an empire, depends on the personal character of the sovereign. The present occupier of the throne has every quality—good sense, undaunted courage, great decision, and the utmost vigilance and activity—required in the ruler of such a country. But should the government fall into less able and skilful hands, it is not improbable that Russia may become the theatre of revolution and change, for which, at present, she certainly is not fitted.

The following table gives a view of the extent of the Russian dominions at different epochs:—

	Germ. sq. m.
In 1535, at the accession of John the Terrible, his dominions comprised	57,300
— 1585, at his death	144,000
— 1613, at the accession of Michael Romanoff	148,000
— 1645, at his death	258,000
— 1725, at the death of Peter the Great	280,000
— 1741, at the accession of Elizabeth	325,000
— 1796, at the death of Catherine II.	356,000
And at present (1841)	364,000

Tables similar to this have been the theme of much silly declamation about the grasping, insatiable ambition of Russia. No doubt her rulers have the same desire to extend her territories as those of France, England, or any other power; but certainly they are not, in this respect, at all peculiar. In point of fact, however, by far the greater part of the territorial acquisitions of Russia have consisted of mere deserts, or of countries occupied by roving barbarians, and are worth little or nothing. Her really valuable acquisitions have been confined to those on the side of Poland and the Black Sea. Her conquests in this direction have added materially to her power; and it is but fair to add, that they have also added materially to the well-being and civilisation of the inhabitants.

RUSTCHUK, or RUTZSCHUK, a fortified city of Turkey-in-Europe, prov. Bulgaria, cap. Sanjak, on the Danube, 56 m. E. by N. Nicopolis, and 62 m. N.W. Shumla. Pop. variously estimated, but may probably be about 30,000. It is built on a steep bank, up which the streets ascend from the river. It is surrounded on three sides by walls, in the manner of Turkish fortifications; but towards the river it is partly open. At its N.E. extremity is a ruined citadel, on an abrupt height above the Danube. "The description already given of Belgrade applies, with very little modification, to this Bulgarian city, except that Rustchuk is not in such a state of dilapidation, and the Turks here appear more civilised than the Servians: they have schools for their boys; and several of the houses are furnished with glass windows. The comfort of fountains, simple as they are in exterior, and the luxury of coffee-houses, are not unknown to the Bulgarians; on the contrary, the one and the other abound in Rustchuk." (*Elliott's Trav.*, i. 180.) The streets are narrow and gloomy; on either side they present only dead walls; and as in all the rest of Bulgaria and in Roumelia, each of the larger houses is a fortress in itself. The governor's palace, some of the mosques, and some public baths are the only edifices worth notice. Many of the buildings are white-washed, and their tall chimneys are visible at a great distance. Woollen, silk, and cotton stuffs are made here; and there are many Turkish, Greek, and Armenian merchants in the town, who carry on considerable trade with Vienna, Wallachia, &c., in cloth, corn, and indigo. Mr. Quin observed in the shops of Rustchuk, "a rich display of military saddles and bridles, belts, and cartouches-boxes, gaily ornamented; of Persian carpets, Broussa silks, ataghans, pistols, pipes, umbrellas, Greek caps, scarlet jackets, yellow slippers, gold-headed canes, fine cloths, woollen and cotton stockings, and every article of grocery, fruits, vegetables, meat, fowl, fish, hardware, and jewellery. The floors of these shops were usually elevated above the level of the street, and the owners and their assistants sat inside upon the floors, some

working as tailors, some as saddlers, and artisans of the ordinary trades." (*Voyage down the Danube*, 314-15.) In 1812, the Russians took and burned the citadel and a part of the town; and, in 1829, they entered the town after little opposition. (*Elliott's Trav.* i. 178-182; *Quin's Voyage*, 288-315; *Slade's Germany and Russia*, 187-189.)

RUTHERGLEN (pronounced Ruglen), a royal and parl. bor. of Scotland, co. Lanark, on the left bank of the Clyde, 2½ m. S.E. of Glasgow. Pop., in 1841, 5,622. It consists of one leading street, straight and well-paved, nearly ½ m. in length, 112 ft. broad, and of the parallel lane called the Back Row. From both sides of the main street, which lies in a direction nearly E. and W., go off a few cross lanes. There are no public buildings except the par. church, a *quoad sacra* place of worship connected with the establishment, a chapel belonging to the Relief, and the town-hall. A small cotton-mill employs about 80 hands; and there are two print-works in the vicinity, a Turkey red dye work, and a chemical work. About 500 hand-loom muslin weavers are employed by Glasgow manufacturers.

Rutherglen was created a royal bor. in 1126, at which time it was of more importance than Glasgow, the latter being included within its municipal boundaries. But in 1226, Alexander II. granted a charter to Walter, Bishop of Glasgow, relieving his town from certain servitudes previously due to Rutherglen. (*Mun. Corp. Rep.*, 1835, part ii. p. 371.) Previously to the passing of the Reform Bill, in 1832, Rutherglen, unimportant as it has been, enjoyed the same parliamentary privileges as Glasgow; being united with it and two other towns in sending 1 mem. to the H. of C. Glasgow has since that period had 2 representatives for itself; while Rutherglen joins with Kilmarnock and 3 other bors. in choosing a mem. Registered voters, in 1849-50, 165. Municipal councillors 18; corporation revenue, 1848-49, 855*l.* (*New Stat. Acc. of Scotland*, § *Lanarkshire*, p. 373-398; *Ure's Hist. of Rutherglen*, 1798.)

RUTHIN (Welsh *Rhudd-ddyn*, or *Rhuthyn*, the "Red fortress"), a parl. and mun. bor., market-town, and par. of N. Wales, co. Denbigh, hund. Ruthin, in the vale of Clwyd, 17 m. W.S.W. Chester, and 45 m. N.W. Shrewsbury. Pop. of mun. and parl. bor., in 1831, 2,376. The town, situated on rising ground, chiefly E. of the Clwyd, consists of a principal avenue, entered by several other inferior streets. At the summit is the market-place, in which is the town-hall, a substantial building, erected in 1663, but recently repaired. The co. hall, a fine modern stone structure, forms with the gaol an interesting feature in the town. The gaol, recently enlarged by the addition of a building for female prisoners, has suitable arrangements for the classification of the inmates. The church, originally conventual, belonging to a community of Bonhommes, is an ancient structure of mixed architecture; the tower, S. and W. fronts, being comparatively modern, and much inferior to the rest of the building. The interior is elegantly fitted up with stalls, tabernacle-work, &c., and the roof is of carved oak, pannelled, and richly sculptured. It was made collegiate in 1310 by John de Grey, who formed an establishment for regular canons, and endowed it with valuable lands and numerous privileges. A part of the cloisters has been converted into a residence for the warden of Christ's Hospital, founded here by Dr. Gabriel Goodman, for the support of 12 decayed housekeepers. The warden and pensioners are impropiators of the great tithes of Ruthin and Llan-Rhydd; and the warden, who is appointed by the dean and chapter of Westminster, is the vicar of both parishes, with an income of 263*l.* a year. The free grammar-school is endowed with a moiety of the tithes of Llan-Elidan, and is under the superintendence of the warden, though the appointment of the head-master rests with Jesus College, Oxford: the school ranks as one of the best in N. Wales, and is attended by about 50 boys. A national school is established here for 40 children of each sex; and there are Sunday-schools attached to the chapels of the Independents, Wesleyan and Calvinist Methodists. No particular trade or manufacture is carried on in the town, exclusive of what is necessary for the accommodation of the inhabs., who are principally employed in agriculture; and no change of any consequence appears to have taken place in it for several years, neither are any canals in operation or likely to operate towards the extension of the town beyond its municipal limits. (*Mun. Bound. Rep.*)

The corporation of Ruthin consists, according to the Mun. Reform Act, of a mayor, 3 aldermen, and 12 councillors. Corp. rev., in 1839, 145*l.* The bor. unites with Holt, Wrexham, and Denbigh, in sending one mem. to the H. of C., the right of election down to the Reform Act having been vested in the resident burgesses. The parl. limits, according to the Boundary Act, include, with Ruthin, parts of the pars. of Llan-Furog, Llan-Rhydd, and Llan-Fair-Dyffryn-Clwyd. Reg. electors, in 1839-40, for the united bors., 941. Ruthin is likewise one of the polling places at elections for the co., and the

assise town; besides which the quarter sessions are held alternately here and at Denbigh. Markets, well supplied with corn, on Monday, and a provision market on Saturday. Fairs, March 19, Friday before Whit Sunday, Aug. 8, Sept. 30., and Nov. 10.

Ruthin, according to the Welsh historians, is of high antiquity; but we have no authentic information respecting it prior to the reign of Edw. I., who built here a magnificent castle, overlooking the Clwyd, on its W. bank, which he presented, in 1281, to Reginald de Grey. The ruins have been restored with admirable taste by the present proprietor. The manor of Ruthin belongs to the Lady Grey de Ruthin, daughter of the 19th baron of that name, who has been a great benefactress to the town.

RUTLAND, an inland co. of England, surrounded by Lincoln, Leicester, and Northampton. It is the smallest of the English co., containing only 95,360 acres, of which about 90,000 are arable, meadow, and pasture. Surface, entirely varied; air pure; and the soil almost every where sandy and rich. The W. part of the co., in which is the ale of Catmose, celebrated by Drayton, is under grass, and the E. chiefly in tillage. It is particularly celebrated for its wheat, cheese, and sheep. Estates and farms of various sizes. Average rent of land, in 1843, 37s. 5½d. an acre. The river Welland runs along its S.E. border, from Rockingham to near Stamford; and there is a canal in the river Soar to Oakham, the principal town. It is divided into 5 hundreds, and 25 parishes; and returns 10 mess. to the H. of C., both for the co. Registered electors, in 1849-50, 1,908. In 1841, Rutland had 4,204 ab. houses, and 21,302 inhab., of whom 10,721 were males, and 10,581 females. Sum expended for the relief of the poor, in 1848-49, 7,985l. Annual value of real property, in 1815, 138,216l.; ditto, in 1843, 156,987l.

RYDE, a town, sea-port, and watering-place of England, on the N. side of the Isle of Wight, par. of Newchurch, and hund. of E. Medina liberty, 5½ m. E.N.E. of Portsmouth. Pop. of Newchurch, in 1841, 8,370, of which 5,840 belonged to the town of Ryde. The latter presents a peculiarly handsome appearance from Portsmouth, the distance to which it lies, at a distance of about 5 m.; its houses, interspersed with gardens and plantations, are ranged in successive rows upon a tolerably steep hill, rising directly from the sea, backed by bold cliffs and surrounded with cultivated land. It consists of a principal street, running upwards from the shore, intersected by others, some of which comprise hand-detached residences, well adapted for the numerous visitors who flock thither during summer. It has two squares, one of which is a handsome modern square, and the other is a place of worship for Wesleyan Methodists, Baptists, and Independents, with attached Sunday-school, and an endowed charity school: it has also a theatre, assembly-rooms, libraries, baths, &c., and good hotels. The accommodations for summer visitors have been greatly improved within the last few years. Ryde has risen into favour; and a pier, constructed on wooden piles, runs ½ m. into the sea, making the town accessible seaward at all times of the tide. Boats run nearly every hour in the day, during the season, between Ryde, Portsmouth, Cowes, and Southampton; and the opening of the South-western railway has occasioned a great influx of visitors to this and its watering-place, W. Cowes. The air is salubrious, and the environs are many agreeable walks commanding land and sea views; but as a bathing place, it is inferior to Southsea, on the opposite coast of Hampshire, or to Cowes, on account of the shallow water for a lengthened distance from shore. Manufactures, and its trade is principally confined to the supply of visitors and the inhab.

RYE, a par. and mun. bor., cinque port, market-town, par. of England, co. Sussex, hund. Godstow, par. of Rye, on the Rother, about 3 m. from its mouth, 12 m. by N. Brighton, and 53 m. S.E. London. It is a mun. bor. (which comprises with the par. of Rye and Winchelsea and 6 others, with a portion of the par. of Rye, in 1841, 7,657. The town, which stands on an extensive tract of marsh land, running east as far as Hythe, consists of several regular streets, lined with old, but respectable houses, many of which command fine views of the sea and surrounding country. In the centre of the town is the market-house and town-hall, with an old clock tower, the Ypres Tower, occasionally used as a public library is supported by subscription, and a small theatre. The church is a large cruciform structure, with a central tower, partly of Norman and partly of early English architecture: the aisles of the church have fine lancet windows, and there is a large perpendicular E. window. The living is a rectory, in the gift of the Earl of Burlington. The church is a place of worship, with attached Sunday-school, and a small endowed grammar-school, school, with several almshouses and other

charities. "There is no manufactory in the town, which depends upon being the port and market through which the surrounding rich agricultural district is supplied. Some years since it is said to have been in a declining condition; the reverse, however, is now the case, and it appears to be, indeed, in an eminently thriving state. This is mainly attributable to the improvements lately made in the harbour and in the navigation of the river, which have made the town accessible to vessels of 200 tons. By means of the Rother and its branches it supplies the surrounding country to a distance of 8 m. with coals and other articles; and there is a project in contemplation to extend the navigation as far as Robert's Bridge, a distance of 15 m. in a straight line. This, if carried into execution, will be a source of considerable advantage to the town, which will then become the port through which the country, as far as Battle, will be supplied. In January, 1850, there belonged to the port 75 vessels of the agg. burden of 4,214 tons. In 1849 the gross customs' duties amounted to 2,257l. The exports are chiefly wool, oak timber, and bark. A considerable quantity of hops is raised in the neighbourhood, for the drying of which large quantities of Welsh coal are annually imported. (*Mun. Bound. and Corp. Rep.*)

Rye is a bor. by prescription, and is governed under the Municipal Reform Act, by a mayor, 3 other aldermen, and 12 councillors, styled "the mayor, jurats, and commonalty of the ancient town of Rye." Corp. revenue in 1847-48, 776l. Courts of session are held under a recorder; and there is a court for the recovery of debts under 40s. Rye returned 2 mems. to the H. of C. from the 42 Edw. III. down to the Reform Act, which deprived it of one of its members, and at the same time enlarged the electoral limits, so as to comprise with the old bor. the rest of the par. of Rye, the town and par. of Winchelsea, with six other entire pars., and a small portion of the par. of Brede. Reg. electors in 1849-50, 574. Markets on Wednesday and Saturday; fairs, Whit-Monday and Aug. 10.

Rye is very ancient, but its early history is little known. It appears to have been an original Cinque Port, and is mentioned as a member of these ports in a charter granted by Henry III. In the reign of Edward III. the town was so considerable, that it sent 9 armed vessels to the royal fleet when the king undertook the invasion of France. In the next reign, A.D. 1377, it was plundered and burnt by the French, but it soon recovered its consequence. The rise of other ports on the same coast during the last century, and the filling up of its port, occasioned a considerable decrease of its importance, which, however, as above seen, it has now a fair prospect of in some measure recovering.

S.

SACKETT'S HARBOUR, a village or town and port of entry of the U. States of N. America, state New York, co. Jefferson, on a bay at the E. end of Lake Ontario, at the mouth of Black River, 41 m. N.E. Oswego, and 150 m. N.W. Albany. This is a prosperous, rapidly increasing town: in 1835 it extended a mile along the bay, and had three places of worship, several schools, stores for all goods in ordinary demand, a steam-engine factory, saw and other mills, barracks for the accommodation of 2,000 men, and many dwellings substantially built of limestone, &c. We have no late account of the pop., which, however, we understand may be taken at about 7,000. The harbour is the best on the Lake, and is used by the American government for ship-building, and as a naval depot. A peninsula juts out from the lower extremity of the town, forming an inner and outer harbour, the latter of which has water sufficient to float the largest ships of war, within 2 fathoms of the shore. Near the mouth of Black River is another equally good port; and vessels of the largest class are built at both. A considerable trade is carried on from this port by the Lake and the St. Lawrence; and by the Oswego, Erie, and Welland canals. Numerous vessels for the navigation of the lake are built here. Agg. burden of shipping belonging to the port, 30th June, 1849, 8,776 tons. Here is a waterfall sufficient to work machinery. (*New York Gaz.*)

SAFFI, AZAFFI, or ASFI (an. *Saffa*), a city and seaport of Morocco, prov. Abda, on the Atlantic, near Cape Cantin, and 95 m. N.W. Morocco. Pop. estimated at 12,000, including about 3,000 Jews. (*Gräberg of Hemso.*) It is built in a sterile ravine between two hills; being very hot in summer, and disagreeable in winter, "as the waters from the neighbouring mountains, occasioned by the rains, discharge themselves through the main street into the ocean, deluging the lower apartments of the houses." (*Jackson.*) It has thick and high walls, and a

neat palace, formerly the occasional residence of the emperor's sons; a little way N. of the town is a small fort. Its roadstead is safe in summer, but in winter, when the winds blow from the S. or S.W., vessels are obliged to run to sea; which they have been known to do several times in the course of a month, while taking in their cargoes.

Saffi was formerly an emporium of the European trade with Morocco, but its commerce has declined with the rise of Mogadore; on the foundation of which, in 1760, the emperor ordered the removal thither of all the merchants of Saffi. The Moorish and Bedouin inhabitants are fanatical and intolerant, and said to be inimical to Europeans, with whom, however, they have now little intercourse. In the environs are many Mohammedan sanctuaries. This city is supposed to have been founded by the Carthaginians. In modern times, it belonged to the Portuguese, from 1508 till 1641. (*Graberg of Hemes, Speeches di Morocco; Jackson's Morocco, &c.*)

SAFFRON-WALDEN (an. *Saffron-wald-den*, "the woody hill abounding with saffron"), a municipal bor., market-town, and par. of England, co. Essex, and hund. Uttlesford, 23 m. N.N.W. Chelmsford, and 37 m. N.N.E. London. Pop. of mun. bor., in 1841, 8,111. The town, in a valley close to a tongue of high land, surmounted by the church, comprises several good streets and a spacious market-place, with a neat town-hall. Many of the houses are good, and the place generally bears an appearance of neatness and comfort. The church, which stands so high as completely to overtop the town, is an elegant structure in the perpendicular style, with an embattled tower at its W. end: the living, a vicarage in the gift of Lord Braybrooke, is worth 237*l.* a year. The Independents, Baptists, Unitarians, and Friends, have each places of worship. A free grammar-school, endowed by Edward VI., has an exhibition at Queen's College, Cambridge; but the education is now conducted on the national plan, and connected with it is a girls' school, the whole furnishing instruction to about 250 children of both sexes. There are likewise several Sunday-schools, some almshouses lately rebuilt, and various other money charities. Saffron-Walden has several large malting establishments, and enjoys a good retail trade for the supply of the numerous wealthy families in its vicinity; besides which it has well-attended markets for corn, cattle, and provisions. The neighbourhood is extremely productive, and well cultivated; but the growth of saffron (whence the name of the town) has been abandoned. The bor. was incorporated by Edward VI., in 1549, and is governed, under the Mun. Reform Act, by a mayor, 3 aldermen, and 12 councillors. Corp. rev., in 1847-48, 670*l.* Petty sessions for the hund. are held every alternate week, and there is a court for the recovery of debts under 10*l.* Saffron-Walden is also one of the polling places at elections for the N. div. of Essex, and the principal town of a poor law union, embracing 24 para. Markets on Saturday; fairs, for horses and cattle, Saturday before Midlent Sunday, and Nov. 1.

SAGHALIEN. See JAPAN.

SAHARA, or the great central Desert of Africa. (See AFRICA, I. 22.)

SAID (an. *Sidon*), a town and sea-port of Asiatic Turkey, celebrated in remote antiquity as one of the greatest emporiums of the Mediterranean, and as being the parent city of Tyre. Its modern representative is seated on the N. side of a cape extending into the Mediterranean, 23 m. N.N.E. Tyre, 20 m. S.S.W. Beyrout, and 55 m. W. Damascus; lat. 33° 24' 5" N., long. 24° 22' 40" E. Pop. estimated by Mr. Robinson at from 4,000 to 5,000 only, of whom more than half are Christians of the Greek church. Olivier says, "Sidon may be compared with Beyrout as to its pop. and extent, and its streets are equally irregular and filthy; but its situation is more pleasant and advantageous, its houses are better built, and it has *khanes* (hotels or private residences) of considerable extent, and which would not disgrace any city of Europe. Most of these have their own fountains, independent of those distributed through the town. The Aula supplies Said with water, which is brought from it by a channel kept in ill repair, for a distance of more than a league." (*Voy. dans l'Emp.*, Oth. iv. 58 transl.) The streets in the upper town, which stand upon an acclivity, are narrow and gloomy, being arched over in many places, like those of Jerusalem. The lower part of the town is more cheerful. The bazaars are well supplied, especially with leather goods. (*Robinson's Syria, &c.*, I. 269-270.) Most of the houses have gardens attached. On the land side the town is defended by a high wall, now partly in ruins, as well as by a fortress, on a hill to the S., said to have been constructed by Louis IX. of France. There are several mosques, both within and without the town. It has been generally supposed that the ancient city was about 2 m. further inland, and, like many other maritime cities of antiquity, at some distance from the sea-shore, on which its port was situated. The non-existence of any antiquities worth notice at Said seems to favour this opinion; while, at a place

called Old Sidon, at about the distance above stated, some traces of ancient walls and other buildings are still discoverable.

There can, however, be no doubt that the harbour on the N. side of the present town was the port of the ancient as well as the modern town. Here is a quay formed of very thick walls, in parts of which a tessellated pavement of variegated marbles, with representations of animals, festoons, &c., still exists in tolerable preservation. Many granite columns are also wrought into the walls, and others stand as posts to a bridge of several arches, which runs from the main land, to a castle built in the sea, by Fahr-ed-Din, the celebrated emir of the Druses, in the 16th century. The latter, aiming to render himself independent of the Porte, not only fortified Said, but, in order to make its harbour inaccessible to Turkish galleys, choked it up by sinking boats filled with the *débris* of ancient buildings. This measure gave a severe blow to the commerce of the town, the roadstead being so insecure that scarcely a fisherman's skiff can lie in it in safety. (*Bourring's Report*); but even at the end of the last century, the French merchants of Said had a considerable trade with Marseilles, to which they exported cotton, silk, and woollen goods, fruits, corn, oil, scammony, galls, soda, and wax. At present the principal resources of the inhabitants are derived from dyeing, and from the manufacture of leather and silk goods.

Sidon is first mentioned in Gen. x. 15. 19.; and appears to have risen into importance at a very early period, since it is spoken of in Joshua as the "great Zidon," (ch. xi. 8.; xix. 28.) In the division of Palestine it was allotted to the descendants of Asher, but we learn from Judges, i. 31, that it never came into the actual possession of that tribe. Its inhabitants were anciently eminent in ship-building, and were employed by Solomon in the construction of the Temple, there being, among the Jews, none who had "skill to hew timber like unto the Sidonians." Pliny states that it was also famous for its glass manufactures. In its commercial importance, it appears, however, to have been early eclipsed by Tyre, and afterwards generally followed the fortunes of that city. In the middle ages, during the Latin kingdom of Jerusalem, it was a lordship, and an episcopal see under the Tyrian primacy. The crusaders, who lost it in 1111, recovered it from the Saracens in 1150; but were finally obliged to surrender it to the latter in 1289. In its neighbourhood is the convent of Mar-Elias, the residence of the late eccentric Lady Hester Stanhope. (*Robinson's Syria and Palestine*, I. 268. 272.; *Olivier, Voyage en Syrie*, ch. ii.; *Bourring's Report on Syria*; *Mod. Trav.*, vol. ii., &c.)

SAI-GON, a city, river-port, and the chief emporium of the empire of Anam, prov. Tsiampa, of which it is the cap., on the river of its own name, about 60 m. above its mouth; lat. 10° 47' N., long. 107° 5' E. Pop. loosely estimated at 180,000, among whom are many Chinese. It consists of two distinct towns, about 3 m. distant from each other, though the intermediate road be lined all the way with straggling houses. Pingeh, which has the citadel, and is the seat of the governor, is on the W. bank of the great Sai-gon river; whereas Sai-gon proper, the main seat of commerce, is on a smaller river, which, however, is navigable for good-sized boats. The two towns are nearly of like size. The streets, which are regular, and intersect each other at right angles, are in some instances of great width. Along these, or along canals, many of which traverse the city, the houses are disposed in straight lines, and close to each other. They are built chiefly of mud, enclosed in bamboo frames, and plastered; sometimes they are tiled, but more frequently thatched with palm-leaves or rice-straw: they have seldom more than one story; but some of the better sort are surrounded with an open court-yard, with a gate towards the street. In Sai-gon proper, some of the streets are paved with flags; and quays of stone and brickwork extend nearly a mile along the river. The citadel, in Pingeh, constructed by a French engineer in 1790, has not been completed. It is a quadrilateral fortress, with earth ramparts, bastions, horn-works, a regular glacis, esplanade, and dry ditch. When Mr. Crawford visited the city, no guns were mounted on it, though there were several French cannon in the arsenal; and at present it is not capable of a regular defence. The interior, which is neatly laid out, has barracks, officers' quarters, and the governor's residence. In the N.E. part of the city, on the banks of a deep creek, are the naval yard and arsenal, one of the most complete establishments in the empire, where many good junks and war-boats have been built. The rice magazines, the naval arsenal, and the royal palace, a brick edifice, are the other principal public buildings. Sai-gon communicates with the Camboja river by a canal 21 m. in length, about 80 ft. in width, and 12 ft. in depth. Its foreign trade, which is principally with China and Siam, is much less considerable than that of Bangkok. The principal articles exposed for sale in the shops are Chinese earthenware,

of colors and well-arranged plans. The entire tower and spire (the entire height of which is estimated at 100 ft.) are of iron cast, the admirably constructed to the style of the building. The plan is that of a complete octagon, being various chambers, an octagonal chapel, a room and a room for a library and museum, and a room for a museum, each of which has an octagonal tower, and the tower has a large 14 paces. The octagonal height of the church (including the Lady chapel) is estimated at 10 ft. breadth of nave and aisle, 70 ft. height of nave, 10 ft. and width, including the great transept 10 ft. Square altarpieces have taken away the altar screen, and through the Lady chapel open to the choir the open screen, also as well as a large portion of the intricate work to the choir is of octagonal construction. The 8 windows in the choir with a beautiful painting of the Resurrection, from the designs of Mr. John Ruskin, another window contains a painting of the Ascension of the Virgin in the 16th century. There are other painted windows, and the eastern parts of the church are several painted windows, some of which are extremely curious. The W. door is a beautiful decorated specimen of the painted architecture, similar to this church. The angles are terminated by slender square towers, surmounted by spires and pinnacles, and over the great central entrance is a series of sculptured arches, beneath the great W. window which is formed in three divisions. The exterior of the church is enriched with a number of octagonal chimneys to drive at different heights all round the building. Many of the windows still remain, and it is supposed that originally there were about 100. The windows are remarkably magnificent, forming an most square each side of which is 100 ft. in length. The octagonal library is built over the 8 side of the transept, and adjoining them in the same direction is the chapter house - "On the stone" says Mr. Ruskin, the excellent promise an object for architectural study hardly equalled to any in the kingdom - the purity of its style and the various modes of adapting that style to the purposes required denote the most artistic generation.

(Ruskin, *Gothic Architecture* - a 100 ft.)

Within the same, formerly surrounded by a wall and still covered by several ancient gates decorating the entrance, are the remains of the bishop's gate, *Porta Episcopalis*. The gateway leads to opposite the W. front of the cathedral and in a little distance S. E. surrounded by gardens to the bishop's palace, a very irregular building, a different style of architecture, having been enlarged and repaired at various periods from the middle of the 15th century down to a recent period. The gardens are a large ones, comprising an area of several acres, well graced with fine large old trees. The episcopal see was moved from Old Sarum to Salisbury under the authority of a papal bull, in 1197 about which time the cathedral was founded the expense of the erection estimated at 40,000 marks, or £13,333. An enormous sum to those days. The chapter comprises, besides the bishop, 8 clergymen, canonists and 26 monks, constituting a body among them a net revenue of £1,000 annually. Having possessions and separate revenues, with the income of 16 benefices. There are likewise 8 prebendaries, besides church rector, &c. As an overview of these possessions ending each year, the revenues of the episcopal amounted to £1,000 a year, but it rather has to be to be augmented to £1,000 a year. The bishop also a large portion of the cathedral patronage but that of the cathedral, its diocese extends over the S. of Wiltshire and a portion of Gloucestershire. Suffragan these other churches are of which, in Salisbury, is in the gift of the bishop and that of Salisbury is in the patronage of the dean and chapter. It contains a superb altar structure with large windows and good treasury the church having been modelled. The tower fell down and was rebuilt in the twelfth century. St Thomas is a large perpendicular of good composition, with its tower standing on side of the S. aisle. It has a nave and chapter with choir and a cloister. St Martin is a large church, early English style with some good recent Gothic. St. Elizabeth is small and of mediocrity.

The Roman Catholics have a handsome chapel - there are places of worship for Independents, Episcopians, Methodists, and Unitarians with a Wesleyan church. A grammar school is attached to the cathedral for the instruction of the poor boys and another in the city, founded by Queen Elizabeth the patronage of the corporation. The bishop is a good orator, and there is also an orphan and the different parishes have their respective religious societies. As there are good churches, rich men have mentioned that of St. George's, Four Corners Bridge; Trinity Hospital, founded in the Elizabethan era, has 19 aged patients; and Bishop College for educating a select, with several orphanages, women's shelter, &c. An infirmary.

ment and our Fisheries trips to RVN, to specially equipped and equipped, a community society has been established with considerable success, and there are various other important institutions, clubs, and sports facilities.

A survey and has been recently created in Flushing, and there is a special test now therein. Little attention, with economy and constant results. A weekly newspaper called the Railway and Warehouse Journal, has a pretty extensive circulation. There are generally held once the week in August. The town of Salisbury cannot be considered as increasing, or in a state of improvement, having very little trade. An extensive weapon manufacture was formerly carried on here, but it is now confined to a single factory, and entirely for which this town was once famous is now brought for sale from Birmingham. (Food and Mineral Survey Report) It has derived very great advantage from being connected with the E. Western Railway by a branch line from Minneapolis, which passes close by

Salisbury received his first charter from Henry III., which was afterwards renewed by several monarchs. According to the Municipal Customs Act, it is divided into 5 wards, and governed by a mayor, 6 aldermen, and 16 councillors. Quays and public buildings are held under a revenue licence which the mayor and quarter masters for the town are hab-

Salsbury owes its foundation to the removal of the ecclesiastical establishment from the once important but now decayed borough of old Sarum, the Norman station of Barchinenses about 10 km N from the modern city. The quarrels between the troops of Henry II and Rainer Le Poer (the turbulent prince of that day) induced the latter to establish his clergy in a more peaceful and advantageous situation: a city soon arose round the cathedral, and by the influence of the monarch and clergy soon became an important place, while the other fell to decay and was ultimately deserted by its inhabitants. Henry III granted the city a charter, confiding in it the same privileges as Winchester and conferring extensive local powers on the bishop of the see. Parliaments were occasionally held here during the 13th and 14th centuries. The city became celebrated, after the death of Charles I, for the alternative attempt of the republic under Colonel Myddelton to perjure Charles II. Two large manufactories existed here prior to the Reformation, but there are no visible remains of these foundations. Among other distinguished individuals to whom Salsbury has given birth, may be specified James Harris, the author of the "Hermes," and of other learned and ingenious philosophical and metaphysical treatises, born here in 1700. Thomas (birth, a citizen but not very learned, destined writer of the last century was also a native of this city. 10 W from Salsbury crosses the vast tract of downs and heath, called Salsbury Plain, and about 6 or 8 m N of the city is the stupendous remnant of Stonehenge which see (Part and Plan. Reports, Rudham's Architecture &c.)

SALON a town of France, dep. Sarthe in Norm., dep. cant. in a fertile plain within about 3 m. of the canal of Cherbourg and 10 m. N. of Mayenne. Pop., in 1866, 4,200. It is divided into an old and a new town, separated from each other by a planted boulevard. It has, according to Hugo an air of splendor of which many larger towns are destitute. Its streets are regular and it has many grand houses and public buildings including a church built by the Templars, the par. church with numerous curious sculptures over the door, &c. On a rocky height, at the extremity of the town, is an old castle, now converted into a house of correction (or according to Hugo a barrack). It has manufactures of silk, cloth, hats, soap, and olive oil and a brisk general trade. The remains of a temple to Juno at Tiberias have been discovered here. Hugo Des Gout. &c.

SALONICA is a Thracian city and was part of European Turkey, capital of its own name, at the S E extremity of the gulf of same name, lat 41° N, W 24° E, lat 40° 30' N, long 23° 15' E. Its pop. was estimated by the Wapote at about 40,000, by S. Thompson at 60,000, and by later

Sale on the E. about 18 m. The Wreath hill rises out of the granite plain on the E. side. The E., or rather the E. W. part of the co., contains several ranges of flat-top square-shaped hills, divided by beautiful valleys. But volcanic, but generally fertile. In the E. it consists of a red sandy loam, like that of Cheshire, in the E., a mixture of clay and loam is most prevalent, and in the W. there is a good deal of gravelly light soil. The harvest is said to be a fortnight earlier on the E. than on the W. side of the co., a difference depending partly, no doubt, on the greater elevation of the ground on the W. side, but partly also, on differences of soil. Sheep is principally under tillage, but, in the E. and W. tending and dairying are carried on to a considerable extent. A good deal of cheese, sold under the name of Cheshire, is likewise in the granite article. It is made in this co. The wool of the hilly tracts used to be of a peculiarly low quality but it has deteriorated during the present century in consequence of the efforts of the farmers to reduce the size of the sheep and the weight of the ewe. The best sort of sheep in the co. is supposed to exceed 100 lbs. producing annually above 7 lbs. perhaps I think these are produced on the borders of Hereford, largely variously divided, some contain being very fine, while there are many of very inferior degrees of so. On the borders of Wales, farms very small, many exceeding 50 acres, but on the E. side of the co., in a vicinity of Methel, Wellington, Newport, &c., they are from 100 to 200 acres or more.

The district of Cien Forest, in the S. W. part of the , is divided into small household properties, varying in size from 20 to 1000 a year, the majority being of the poor class. Their occupants, who, in most cases, are the owners, employ few laborers, the principal part of the work on their farms being executed by themselves and their families. Lumber land contains are a formerly and farms generally held from year to year. Agriculture improving, but, owing to the smallness of a reasonable length, and with proper care, as to management, it continues to be very delicate. The number of corn crops, taken in succession, have materially diminished since 1880; but two or three crops still are uniformly follow each other in rotation do not, however apply to the district on E. side of the pr. mentioned above; where the

Jewell monetary (Parker, Lord Falmouth, Boston, etc., de Mod. Free)

BALY is a city of 8 American, esp. of the nature of its

own name, republic of La Plata, on the high road from Buenos Ayres to Patag., 200 m. N. W. the former city; lat 35° 30' N. long 65° 15' W. Pop. from 2,000 to 3,000. Upon the whole it has a neat appearance, and boasts of a cathedral and many churches. It is, however, badly situated in the bottom of a valley through which flow the rivers Arica and Salita (tributaries of the Salado); the latter of which has, of late years, inundated its arched bed, and came to threaten, at no distant period to burst over the low marshy grounds upon which the city stands." (*Parish, Buenos Ayres* p. 174.) Its air is unhealthy, but its vicinity abounds with wheat, rice, cattle, &c., in which, and in salt wine, hides, and such the city has an active trade. It was founded by Don Pedro de Lerna in 1583.

SALTASH, a decayed but . market-town, and par. of the county of England, in Cornwall, & the hundred of West. 17 m. S E S Looeaton, and 4 m N W Plymouth. Pop. of bur. in 1861, 1,841. It stands on a steep rock, near the Tamar, from which the principal street runs at right angles, the houses rising one above another to the hill-top, on which stands the chapel and town-hall. The latter is supported by pillars, the open space beneath being used for a market. Streets narrow and ill-built; the houses being, for the most part, little better than cottages, though chiefly of stone from the rock on which the town stands. The chapel is small, and the living is a curacy subordinate to the vicarage of St. Stephen, value £11 a year. There are also two places of worship for Dissenters, with attached Sunday schools, and there is a small free-arched bridge, which appears to have been formerly of more importance than at present, is principally inhabited by fishermen, or persons connected with the docks and shipping of Devonport, and in summer is a favourite resort for holiday people from Plymouth and the surrounding neighbourhood. It is likewise one of the chief entrances into Cornwall from Devonshire, and is approached by a ferry over the Tamar, the revenues of which belong to the corporation. Saltash was made a free bur. in the reign of Henry III., and returned 1 guinea to the M of C from the reign of Edward VI down to the Reform Act, by which it was disfranchised. It was considered of too little importance to be included in the provisions of the Municipal Reform Act. Markets on Saturday (airs, Feb. 2, July 26., and the Townships before each quarter day.

SALT COATS, a seaport town of Scotland, co. Argy., partly in the par. of Ardnamurchan, and partly in that of Strivenham, 20 m. S W Glasgow and about 1 m. S Ardrumna. Pop., in 1861, 4,500. It has some good houses; but on the whole, is indifferently and irregularly built, and seems lacking. It has a town house, with a handsome spire, clock and hall; its name is derived from the salt works established in the town for the production of salt, by the evaporation of sea water; but since the repeal of the duty on salt, they have been nearly abandoned. Magnesia, however, still continues to be produced to some extent. The principal

dependence of the inhab. is on the weaving and sewing of muslins, for the Glasgow manufacturers. There may, in all, be about 500 looms so employed; principally on lappets, gauzes, shawls, trimmings, silks, &c. About 20,000 tons of coal are annually shipped here for Belfast, Dublin, &c. A good deal of ship-building was formerly carried on; but latterly it has declined. Two congregations belong to the United Associate Synod, and one to the Relief; and there is a Gaelic chapel. It has a subscription library, a parochial school, a free school, managed by a committee of ladies, and other schools, a savings' bank, and some friendly societies, a branch of the Ayrshire Banking Company, &c. The harbour is very defective; and in this respect it labours under great disadvantages as compared with Ardrossan. (*New Statist. Acc. of Scotland, Ayrshire, parishes Ardrossan and Stevenston.*)

SALUZZO (Fr. *Saluces*), a city of the Sardinian dom., div. Coni, cap. prov., at the foot of the Alps, on an affluent of the Po, 30 m. S.S.W. Turin. Pop., in 1838, 14,426. It consists of two portions, one on the summit and declivity, and the other at the foot of a hill. The upper town is walled, tolerably well built, and has a castle, which was, for three centuries, the residence of the Marquises of Saluzzo; one of whom, between 1478 and 1480, constructed the gallery through the Col de Viso. (*Murray's Handbook for Piedmont*, 344.) The lower town is the more populous, and continues on the increase. The cathedral, a handsome building, is in a suburb. Saluzzo has several convents, an intendency, a court of primary jurisdiction, and a royal college. It is a bishop's see. Its chief manufactures comprise silk, leather, hats, and hardware: and it has some trade in wine, corn, and cattle. Under the French, Saluzzo was the cap. dep. Stura. (*Rampoldi, Courg., &c.*)

SALZBURG, a city of Upper Austria, cap. of the circ., as it formerly was of an archbishopric of the same name, on the Salzach, a tributary of the Inn, 67 m. S.W. Linz, and 70 m. E.S.E. Munich. Lat. $47^{\circ} 48' 10''$ N.; long. $13^{\circ} 1' 25''$ E. Pop., in 1848, about 12,000, having decreased considerably since Salzburg ceased to be the cap. of an indep. territory. The Salzach, which here flows impetuously between two masses of rock, divides the city into two portions, connected by a stone bridge, 370 ft. in length. It is walled, and entered by eight gates; and on a lofty point, commanding the town and adjacent country, is the *Hornszitzberg*, formerly the feudal citadel and residence of the prince-archbishops, but now used as a barrack. On the opposite side of the river is the *Capucinerberg*, a similar height, surmounted by the Capuchin convent. Owing to the number of its churches, the profusion of marble statues, and flat-roofed houses, Salzburg has the aspect of an Italian city. According to Turnbull, one of the principal hotels, which, he says, forms a fair specimen of the general style of building, "is a heavy pile of masonry, five stories in height, and composed of walls, floorings, and internal divisions, from the basement to the roof, entirely of stone." Generally speaking, the city is dull and gloomy, and its streets narrow, irregular, and grass-grown. The cathedral, constructed in the 17th century, on the plan of St. Peter's at Rome, is large and imposing, and has numerous monuments, sculptures, paintings, and other works of art. It has a fine facade of white marble, occupying the whole side of a public square, with three entrances, flanked by two rows of marble statues. Several of the other churches are highly gilt, and decorated. Monasteries are numerous, but the number of their inmates has been much reduced. In the church of the Benedictine convent is the tomb of Michael Haydn, the musical composer, who, as well as Mozart, was a native of Salzburg. The Mirabel palace is a handsome modern edifice. One of the greatest curiosities in the city is a gateway or tunnel, 420 ft. in length, cut through the solid rock (*Spencer*), though for what purpose we are not informed.

Salzburg has a military and three civil hospitals, several charitable institutions, a government pawn-bank, and a prison. It had formerly a university; but this is now reduced to a lyceum of two faculties, medicine and jurisprudence, with a library of 20,000 vols., and probably of 120 MSS., some of the 8th and 9th centuries, a botanic garden, zoological museum, &c. In the Benedictine convent is another extensive library, with collections of coins, &c. It has, also, a gymnasium, Ursuline female school, a spacious public cemetery, a public museum, and a theatre. Salzburg is still the residence of an archbishop, who has five suffragans; and is the seat of the superior courts for the circle, &c. It has manufactures of cotton yarn, leather, starch, gunpowder, iron wire, and files, and some transit trade, though this has very much diminished. It is well and cheaply supplied with provisions; but the prevalence of *goutre* is a drawback to its advantages. All travellers agree that it is hardly possible to exaggerate the romantic beauty of the scenery of the neighbourhood.

Salzburg is supposed to occupy the site of the anc. Ju-

varia, destroyed by Attila in 448. In 802, Charlemagne and the ambassadors of Nicephorus, emperor of the East, met in this town to settle the boundaries of their respective empires. In the 13th century the city became the cap. of a territory, governed by its archbishops till 1802, when it was secularized. (*Estr. Nat. Encyclop.; Berghaus; Turnbull's Austria*, i. 139-143.; *Spencer; Germany and the Germans*, ii. 309-312.)

SAMARANG, a town and sea-port of Java, on its N. coast, the cap. of a prov., near the mouth of the river of its own name, 240 m. E.S.E. Batavia; lat. $6^{\circ} 46' S.$, long. $110^{\circ} 27' E.$ Pop. supposed to be at least 20,000, including many Chinese and some Europeans. It is tolerably well built, and is fortified with ramparts and a wet ditch, capable of resisting a native force. It has many good houses, a large church, town-hall, and hospital, a military school, theatre, and observatory. Before it is a deep morass, and it communicates with the sea only by two raised causeways and the river: it is, however, less unhealthy than the lower parts of Batavia. Provisions are cheap; and near the town are many country houses. "The river, or rather creek, is very shallow, and cannot be entered by loaded boats at low water. The roads are also exceedingly insecure; the town owes its importance, therefore, solely to the industry of the natives in the adjoining districts, who raise large quantities of coffee, pepper, and rice. Many ship-loads of the latter are annually exported to China, and to different countries in the Archipelago." (*Earl's Eastern Seas*, p. 42.) Samarang is the seat of one of the three civil and criminal courts, and courts martial in the island, and the residence of a governor with extensive authority.

SAMARCAND, a city of indep. Tartary, in Bokhara, on the Sogd, or Zer-Afshan, 120 m. E. Bokhara, lat. $39^{\circ} 38' N.$, long. $68^{\circ} 50' 15'' E.$ Pop., according to Sir A. Burnes, about 10,000. The out-works are said to be about 30 m. in circ., enclosing gardens, parks, fields, and extensive suburbs: the inner wall surrounding the city is of earth, and has four gates. Samarcand has the appearance of having been magnificently built; but it is now in a decayed condition, and gardens, fields, and plantations, occupy the place of its numerous streets and mosques. There were formerly upwards of 200 mosques, many of which were of white marble; but most of these have become mere ruins. Of the 40 *medressas*, or Mohammedan colleges, only three are perfect, one of them forming the observatory of the celebrated Ulug Beg being extremely handsome, ornamented with bronze and enamelled bricks. Another college, called Sberedar, is likewise of very beautiful architecture. The tomb of the famous Timour Bee, or Tamerlane, and his family, still remains; and the ashes of the emperor rest beneath a lofty dome, the walls of which are superbly adorned with jasper and agate.

Samarcand has several bazars, and three large khans; but its commercial importance is all but extinguished; Bokhara having been for many years the great entrepôt of the caravan-traders, as well as the modern capital of the country. The ancient city, however, is still regarded with high veneration by the people, and till a king of Bokhara has annexed Samarcand to his rule, he is not viewed as a legitimate sovereign: indeed, its possession becomes the first object on the demise of one ruler and the accession of another. Paper, made of silk, is said to have been early manufactured at Samarcand; but ordinary paper is now supplied from Russia. The situation of the city has been deservedly praised by Asiatics, since it stands near low hills, in a country elsewhere plain and level. The climate is dry and healthy; good water is supplied from a great number of fountains, communicating by pipes with the river, and the neighbourhood furnishes abundance of fruit, and other supplies for the market.

Samarcand, which was taken in 1220 by Jenghis-khan from the sultan Mahomet, became under Timour the capital of one of the largest empires in the world, and the centre of Asiatic learning and civilization, at the same time that it rose to high distinction on account of its extensive commerce with all parts of Asia.

It was reunited to Bokhara by Abdullah at the close of the 16th century, since which it has gradually fallen to its present rank as a mere provincial town; and we may now search in vain for its ancient palaces, the beauty of which is eulogised by the Arab historians. (*Burnes's Bokhara*, ii. 270-272.; *Hagemester sur l'Asie Occidentale; Ritter's Asien*, vol. v.; *Dict. Géog.*)

SAMBOR, a town of Austrian Poland, cap. circ. of same name, on the Dniestr, 44 m. S.W. Lemberg. Pop. nearly 10,000. (*Berghaus*.) It is tolerably well built, and has several R. Catholic and United Greek churches, an hospital, a criminal tribunal, mining court, salt intendency, gymnasium, &c. Its inhabs. are employed partly in the manufacture and bleaching of linens, and partly in making salt. Rhubarb is cultivated in the neighbourhood. (*Oesterr. Nat. Encyc.*)

SAMOS, a famous island of the Aegean Sea, now belonging to Turkey, off the W. coast of Asia Minor, from which it is separated by the narrow strait called the

(Lake Superior, only 2 m. across. It lies on the N. E. the
 shore of Lake Erie, to about 50 m. in length. It, and W
 by about 100 to 120 miles breadth. Mount Keweenaw, on
 its E. extremity, on Manitowish, from its neighboring islands
 and generally broader, being to the N. E. of 100° 30' 30"
 long 50° 15' 0". The pop. was estimated by Peter
 Schmitt of 1881, the Territory, a later (though inferior
 authority estimates it at 10,000). In this, we have little
 doubt, we decidedly beyond the mark, even at the time
 when it was found, and since the revolution in Europe.
 There has been a good deal of emigration from the island
 & back to America, some from the extremity of the
 island to the other, most of them are covered, as in
 getting over the forms of rocks and other things, though in
 parts they are precipitous and bare. Tournefort says
 that they contain principally of other minerals. It has
 several pretty extensive valleys, especially on the E. shore,
 which, being not covered by snows from the hills, pro-
 duce, even with the most delicate culture, numerous
 crops of wheat and other grains, with silken, flax, oranges,
 and other fruits, even, still, cotton, &c. he attributes to
 the abundance of its extraordinary fertility. It was then,
 this, situated with the island near, and the water still
 said that was left to form the sides of the mountains
 here, and to distribute their culture. (Parrington,
 1. 102). It is attributed to be the most productive
 island of the Archipelago. It annually exports considerable
 quantities of corn, from 10,000 to 15,000 quarters
 of wheat, and about 1,000 barrels of cotton. The only
 thing which should not be admitted to human was the
 wine (the 100). The Tournefort says that when properly
 made to ferment wine is very superior. Perhaps it was
 not produced in antiquity. Oil and vinegar are also con-
 siderable products of export. Wheat and other wild
 plants occasionally increase, oranges growing the most and
 other, pears are plentiful, and particularly exceedingly
 plentiful. A native of marble is to be said to flourish
 here, and even the precious metals.

Having voluntarily surrendered to the Turks, this blind has been less harshly treated by them than most others in the Archipelago. It however certainly witnessed the scenes of the bitter struggle during the recent bloody struggle, and though it was assigned to the allies by the treaty which recognized the independence of Greece, the island refused at first to submit to his share. Previously to this event, the government of the island was substantially vested in three primitive elements, the Ionians. But now, if we may believe Mr. Pearson, "whom the higher order of Semites are called" and unprincipled conspirators to expunge. [18 190 2, with some to have been no great loss. Besides being governed by the agents of the Sultan and the Principals, a third has, also, been found by a score of Ladrones, gypsies and other Greek pirates, whose only rights to the public expense is that they are made to report some of company. A considerable sum is remitted to the ship of Nargos for his important service in hunting, as a poor the owner and master of the tobacco shop (stronghold 1. 188).

The present cap of the island, called Kharu, or Ma-
h-kharu, is on the S side, about 5 m from the
on the lower extremity of a mountain, on the
ent of which the summit of the mountain, &c are situ-
ed. Though not without some good houses, it is a
crude town, having many shops, exposed, and hardly
walled streets. Vests, on the N side of the island, to
up than Kharu, and has an excellent harbor, but it,
is a wretched place, with streets from 4 to 5 ft. in
it, generally paved and deep. *Forster*, III 140 ;
and in the present state of an island that, to antiquity
one of the most famous in the *Agave* Sea, *Oaxaca*
attained to great distinction. It was one of the
powerful of the states belonging to the *Indian* em-
pire ; and was able, by means of her fleets to maintain
independence since 1 colony and 1 group had captured the
of *Isola*, in the *Continental*. The city of *Kharu*, on
shore of the island was extensive and populous,
ly fortified, and adorned with many noble build-
ings. Among the other great works executed by the
emp. *Montezuma* appears a tunnel, which they had
of through a mountain, to convey a supply of water to
it ; an immense work, constructed for the security
harbour (of which the common title was) *Isola*
to height, and which adjoined to a current line
in, like this one, and the largest temple of which
(*Academy*) had any knowledge. (*Forst.* III 141
142)

Temple to which the venerable historian alludes directed as Juno, and paid a visit to the W. of the car the same year. The island, indeed, was consecrated to Juno and was supposed to have been the place of her birth, and where she expressed Augustus Virgil, speaking of Carthage, where the Gauls also a temple—

Persons **Prison** **State** **with** **rights** **concerning** **state**
Prisoners **the** **concerning** **state** **Prisoners** **the** **state**

The statue of the goddess in this temple was very ancient, having been the work of Demetrius, a contemporary of Darius. Among other statues to and from the temple, were those of Jupiter Minerva, and Hercules, by Hyeron, one of the most celebrated sculptors of antiquity. Mark Antony carried off these statues to Rome, but Augustus made those of Minerva and Hercules be consigned to Rome, reserving only that of Jupiter.

The Thermen games, instituted in honour of Juno, called by the Greeks *Hymn*, were celebrated here with extraordinary splendour. Like other great temples, that of Juno was so capacious for all who inspired the probability of the goddess, and Tarentum attests the arrival of deputations from Sparta, at Rome, proving that the celebration *Sept* was held in accordance. (Junon, in cap. 14. The extensive library of this famous college is but little known. It has however fallen a sacrifice to the ravages of time, or of barbarians, or both. When visited by Tournefort, more than a century ago, portions of two volumes were all that remained standing.

Among other things, there was failure to anticipate the its primary which was everywhere in great quantity; and the art of manufacturing it is even said to have been discovered in this island.

The government of Japan expounded the conditions of such Greek claims. Greece expressed by a stated opinion in summary and pointed conclusion it was obliged the most interested to Polytechny in the the country have been to reach the property by carrying and finally by carrying them in on. (Hypothese: Greece (18th) the death of Polytechny, who

the kingdom was crowned by the capture of a neighboring position, the Romans were attacked by the Athenians under Pericles who, after an obstinate struggle of 3 months duration, succeeded in retaking their city, and at a somewhat later period it received a victory from Athens. During the contest between Mark Antony and Augustus, Rome was for a while the head quarters of the former and of Augustus, who had most have with more than equal magnificence. After Augustus had regained the splendor of the Roman world, he passed a winter in this island, which he restored to its former and at the same time crowded on a select party of his friends. It afterwards became subject to the Greek emperors and finally in the 16th century, to the Turks under whom it remained until it has been returned to the metropolitan state in which we now find it.

Of the many illustrious individuals that Seneca has produced Pythagoras is by far the most distinguished. The god of his birth is not quite ascertained, but it appears to have occurred about 500 years B. C. He early visited Egypt and other ancient seats of learning, but on his return from his travels, being as it said dissatisfied with Polycrates, he emigrated to Magna Græcia, and founded at Croton a school of philosophy then greatly admired to the highest celebrity. Seneca also gave birth to Minerva, said by Herodotus to have been the architect of the temple of Jove at Tarentum the ancestor and a host of others, a surname was among the distinguished guests invited to Polycrates to Seneca.

The narrow strait between Britain and the mainland is famous in ancient history for the great victory gained by it and the adjacent promontory of Mysore over the fleet and army of Xerxes, on the same day that the Persians had left to Greece, while Marathon, was destroyed at Plataea. (Extracts of the authors already referred to, see *Journal of Universal History* vol. 20—2nd. and 3rd. 510 line at : Amsterdam, cap. 74, Pausanias, *Laconia*, cap. 10, 11.)

SAVA a city of Assam, the cap. of Yapan, and the residence of the Indian. It is a valley from 6 to 9 mi. in breadth and 4,000 ft. above the level of the ocean, near the head of the Sittoung river, and about 100 mi. N. E. Mien. Pop. according to the estimate of the Commissioner, is 100,000. The city is walled, as is also its suburb of Hsai-Asai, which was once its principal place. The city and suburb, together, are said to be 40 mi. in circ. The walls are encircled with gardens, but these are in a very bad condition. As both the R. and W. concentrations of the city is a circle having each a palace of the Indian. The streets of Sava are narrow, though broader than those of Mien, and among other Assamian styles. A handsome stone bridge is thrown across the principal stream, above which a dam of water runs in wet weather. House principal y built of brick, with open roofs for windows, and other necessary by wooden structure but some belonging to the higher classes, have glass windows unusually abundant. The palaces are built of heavy stone plastered over with grey-coloured mortar. All the palaces and

dresses in Sana appear to be furnished with fountains. There are about 20 mosques, very elaborately adorned, many having their domes gilt, especially those in which are the tombs of the Imams. The public baths are both numerous and good: they are on the same plan as those of Egypt, and "a favourite resort of the merchants, who meet here to discuss the state of trade, and the news of the day over their cup of keshr, and their never-falling hookah."

A part of the city is appropriated to the Jews, who amount to about 3,000. Each pays about a dollar a year for permission to reside; and a sheikh is appointed, who is responsible for the regular payment of this impost, and of the heavy taxes laid upon their vineyards, gardens, &c. The Jews subsist chiefly by the sale of silver ornaments, gunpowder, and spirituous liquors, and many by working as common artisans, such as shoemakers, &c. There are also many Hindoos among the population, who, like the Jews, are obliged to conceal as much as possible the property they possess, for fear of exaction. The Mohammedan merchants are generally wealthy, and live in good style. The principal trade of Sana is in coffee, the city being in the heart of the coffee country of Yemen. The article is brought into the market in Dec. and Jan.; and considerable quantities of it are retained in the warehouses. It is, however, little used for home consumption, the favourite beverage being *keshr*, an infusion of the husk. The coffee-husk accordingly fetches here the higher price of the two, from 4 to 12 dollars per 100 lbs. being paid for it. Very fine silk goods, spices, sugar, &c., are exposed for sale in the bazaars. The imports are principally piece goods and Persian tobacco; with dates, and a great quantity of thread, or rather twist for weaving. Glass is in great request, and is principally supplied from Egypt. The import duties at Sana are so slight as to be almost nominal.

The climate is too dry to be healthy; rain seldom falls, and famine appears to be a frequent result. Some inscriptions, supposed to be in the ancient Himyar character, have been discovered here (see *Geog. Journal*, vii. 287.), but travellers have hitherto found few, or no other antiquities. The greater part of the fortifications, and an aqueduct now ruined are said to have been the work of the Turks, who held the sovereignty of the country till about two centuries ago. (*Cruikshanks, in Geog. Journal*, viii.; *Nicbuhr, Voyage en Arabie*, &c.)

SANDWICH, a cinque-port, mun. and parl. bor. of England, co. Kent, lathe St. Augustine, hund. Eastry, on the Stour, about 2 m. from its mouth, and 65 m. E. by S. London. Area of town and port, 1,960 acres. Pop., in 1841, 2,913. The parl. bor. however comprises, with the foregoing, the pars. of Deal and Walmer, and the extra-parochial hamlet of St. Bartholomew, having an aggregate area of 3,810 acres, and a pop., in 1841, of 11,194. Sandwich is divided into the three pars. of St. Mary, St. Peter, and St. Clements. It is washed on the N.E. by the river Stour, and surrounded on every other side by a dyke, the remains of its old fortification. It is irregularly built, and has a more ancient appearance than, perhaps, any other town in the county. The streets are well paved, and lighted, and the inhabs. are supplied with excellent water from the river, and from a spring which rises near the Eastry, and is brought to the town by a canal, 3 m. in length. St. Clement's church is a spacious building, with a massive tower of Norman architecture rising from four semi-circular arches in the centre of the building, and supported on strong piers. In some parts it is curiously ornamented. The living is a vicarage, with a nett income of 310*l.* a year. St. Mary's is also a vicarage, worth 117*l.* a year nett. Both the foregoing pars. are in the gift of the archdeacon of Canterbury. St. Peter's is a rectory, in the gift of the crown and the corporation of Sandwich alternately, worth 144*l.* a year nett. There are places of worship for Independents and Wesleyans; two hospitals, one founded in the 12th century, and accommodating 16 residents, who must be freemen; the guildhall, built in 1579, and a new house of correction, comprise most of the remaining public buildings. The free grammar school of Sandwich was founded in the reign of Elizabeth, and received considerable endowments in lands in 1563. Its governors are the mayor and corporation: it has four scholarships in Lincoln College, Oxford, of which two are in the appointment of the governors of the school, and two in that of the rector and fellows of the college; and four in Caius College, Cambridge, nominated in a similar manner. It has, also, a national school and other charities. The town has been for several years in a depressed and declining state. It has no manufactures, and its trade is trifling, consisting principally in the importation of coal for the use of the town and neighbouring country. The scheme of straightening the course of the Stour to the sea so as to form a canal, has been abandoned for want of capital and enterprise. (*Munic. Bound. Rep.*)

Sandwich was first incorporated by Edward III. Its corporation consists of 4 aldermen and 12 councillors,

styled the mayor, jurats, and commonalty of the town and port. Their jurisdiction extends over Ramsgate, Sarr, and Walmer, and did formerly over Deal, which are all members of this cinque-port. Sandwich has, however, no commission of the peace, except upon petition or grant. It has sent 2 mems., usually styled barons, to the H. of C. since the 42d of Edw. III. Previously to the Reform Act, the right of voting was in the freemen, resident and non-resident, the freedom being acquired by birth, gift, marriage, apprenticeship, ownership, and residence. Registered electors in the new parl. bor., in 1849-50, 968; corp. revenue, in 1847-8, 2,032*l.*

Sandwich, formerly called Lundenwick, appears to have risen into consequence, on the decline of Richborough, the an. *Rhatupham*, about the 6th century. It was long a place of considerable trade, and continued, till a comparatively late period, to be a kind of out-port to London, many goods being conveyed by land to and from the capital. Markets, Wednesday and Saturday; fair, Dec. 4., for clothing, &c. (*Mun. and Bound. Reports*, &c.)

SANDWICH ISLANDS. See POLYNESIA.

SANQUHAR, a royal and parl. bor. of Scotland, co. Dumfries, in the valley of the Nith, and near the left bank of that river on the road from Dumfries to Ayr, 26 m. N.N.W. the former. Pop., in 1841, 1,700. It consists principally of a main street along the line of the high road. It has a town-hall, with a tower and clock, a handsome par. church, built in 1823, a Free church, 2 chapels in connexion with the Associated Secession Church, and a chapel for Anabaptists; with a parochial and other schools, a subscription library, a savings' bank, &c. The inhabs. are principally dependent on the weaving of cottons, and on the sewing and embroidery of muslins for the Glasgow manufacturers. There is an extensive carpet manufacture at Crawick Mill, about 1 m. from the town.

Sanquhar seems to have derived its origin from its fine old castle, now in ruins. This, which formerly belonged to the lords of Sanquhar, having been purchased in 1630 by an ancestor of the last duke of Queensberry, became, on the demise of the latter, with other vast possessions in Dumfriesshire, the property of the family of Buccleugh. It was created a royal bor. in 1586, and is united with Dumfries, Annan, Lochmaben, and Kirkcudbright in sending 1 mem. to the H. of C. Registered electors, in 1849-50, 51. Corporation revenue, in 1848-9, 136*l.* Councillors, 17. (*New Statistical Account of Scotland*, art. *Sanquhar*; and *Official Returns*.)

SANTA CRUZ. (See TENERIFFE.)

SANTANDER (an. *Portus Blendium*), a city and sea-port on the N. coast of Spain, cap. prov. of its own name on the W. side of the bay of the same name, running into the Bay of Biscay, 50 m. W.N.W. Bilbao. Pop., acc. to Mifano, 18,716. It is built on the slope of a hill, and has wide streets lined with tolerably respectable houses, the principal public edifices being the cathedral, 2 par. churches, and 3 hospitals. Few of these, however, possess any architectural merit; and Captain Cook, an intelligent traveller, states, that "Santander is almost the only place in Spain of similar magnitude, where no artist in any department has left a memorial of his skill." (*Sketches in Spain*, i. 76.) It is a thriving town, however, with a considerable number of new houses, very unusual in Spain; and it is the chief sea-port of Old Castile, it having been the principal object of the government for some years back to make it one of the principal marts for the supply of Madrid. It has a large trade with Cuba, to which it sends the wheat of Castile, large mills being erected in the neighbourhood for converting it into flour previous to embarkation. The exportation of wool is at present shared with Bilbao; but when the roads are completed, it will have the superiority over that port from its greater proximity to the wool-bearing districts. There are iron-mines in the neighbouring mountains; but, owing to the disturbed state of the country for some years past, they have been little wrought. The *arsillero*, or building establishment of the marine, formerly much employed, is now almost in ruins; and the forests of the Montana, which once supplied Spain with nearly all the timber for the navy, are now seldom used, except for the supply of fuel. The harbour of Santander is large, well sheltered, easily accessible, and sufficiently deep for all trading vessels. The vicinity produces an abundance of wheat and other grains, fruits of several varieties, and large quantities of cattle; the coast also swarming with salmon and other kinds of fish. (*Cook's Sketches*, i. 75-78.; *Mifano*, &c.)

SANTAREM (an. *Presidium Julianum*) a river-port and town of Portugal, formerly the residence of the court, prov. Estremadura, cap. comarca, on the Tagus, 45 m. N.N.E. Lisbon. Pop. estimated at 8,000. It is built on a hill, and consists of 3 separate parts; the Maravilla on the summit, the Ribera on the E. declivity, and the Alfange on the W. and S., descending to the river's bank, and commanded by the fortress of Alcazaba. Only

METHODS

the pillars of the old walls remain. It is well built, and has some good public edifices, but there are several neglected and several have almost fallen to ruin since the capture of the city by the Turks in the 16th century. Justice, covering mosques and convents, fragments has grown together into a system and now, under the walls, did it is the one of the Pashaw's territory the highest eminence, unadorned by the kingdom. Its position is high and well situated, and it has an entire wall over the city. (See Chap. 40.)

[illegible][illegible]

23704 a town and an part of Brazil, from Sta. Is. in a low and extremely shallow on the N side of Island St. Vincent, 20 m. S S E Sta. Paul, lat. 12° 0', long. 61° 10' W. - Access to a place considered to be the shoreward of the great ship of S. Paul, and the coast of entry extends up to the Rio de la Pina. It is naturally well built up, consisting chiefly of mountains, slopes, and a few small islands in S. E. or 1.5 m. (m. p. 25). The bay has however increased lately since the publication of Howe's work, having the flowing from the mountain water in one great little above the town. The port is formed by the reef and the island St. Anne. There are two runs, but that of the S is alone navigable by large s.; the other which is formed by the river flow being in only for small craft. The harbour admits of large quantities, which are sheltered from all winds, thus from the S S W round to the S S. A point absolutely necessary on entering - by edg into the river (from sea) will have to S. S. and the water will be low the low open water to only 10 ft. 4 in 5 fathoms the direction is out of the shoreward side to reach the bottom, and the same water close to the shore. After passing the river ground the water deepens to 10 and 15 fathoms in 10 fathoms of the shore. The bay will be almost empty of the water of the S S fathoms, on a bottom of mud. Provisions are in, and good water may be obtained by sending boats 2 m. farther up the river. (Island's history etc.) The part called the Harbours is defended

BAHIA NAUTICA, cap. of Perna, pop. 8, between lat. 40° 15' and 40° 20', and long. 67° 30' and 67° 45', having in the bay, Vagos, 3 Head-lands, 3 Dunes, and 27 Coves or Ors and Minor Harbors. Length, N. E. and S. W. about 70 m. breadth varying from 15 to 40 m. Area, 500,000 hectares. Pop. in 1900, 10,000. In the N. and E. are the Vagos mountains, and their ramifications. The general slope is to the S. W. in which direction the stream traverses the dip, throughout its course. The climate favors the S. E. boundary. There is a considerable extent of rich soil. In 1904, the cattle trade was supposed to comprise 500,000 head, worth 10,000,000 de. vineyards 1,100 de., and woods, 10,000 de. Agriculture has made some progress within the present century, but it is still very backward. The produce of cereals, grain, etc., exceeds the demand for home consumption. Wheat, corn, and barley are the principal crops. In 1904, according to the official returns, nearly 1,000,000 barrels of grain of all kinds were harvested, besides about 100,000 de. potatoes. The vineyards form a principal source of wealth. The problem was to estimate at about 100,000 barrels a year. The wine of Bay (Charity) Madeira, Quilley, Co. and Champagne-Charbon, are the best they have a fine intense body, as has great and easy to keep for a long time. The price in November 1904 was 10 francs of Champagne de first class, 10 francs de second, 8 francs de third, 6 francs de fourth, 4 francs de fifth, 2 francs de sixth, 1 franc de seventh, 1 franc de eighth, 1 franc de ninth, 1 franc de tenth, 1 franc de eleventh, 1 franc de twelfth, 1 franc de thirteenth, 1 franc de fourteenth, 1 franc de fifteenth, 1 franc de sixteenth, 1 franc de seventeenth, 1 franc de eighteenth, 1 franc de nineteenth, 1 franc de twentieth, 1 franc de twenty-first, 1 franc de twenty-second, 1 franc de twenty-third, 1 franc de twenty-fourth, 1 franc de twenty-fifth, 1 franc Near the Vango large quantities of slaves are grown for the manufacture of linings. Timber is an important product and the annual produce of coal is estimated at 100,000 bags. In 1861 of 109,512 persons subject to the annual Assesment £2,500 were returned at less than £5 and 25,000 at Over £5 to £10, while only 21 were assessed as £100 and upwards. In addition, this city is one of the richest in Prussia. Its iron works employ about 1,500 hands and her iron, iron plates, and wire, steel, and various brass goods are made to the annual value of £4,000,000. Glass and earthenware, cotton goods, paper and hats are also produced. The exports are however mostly confined to agricultural products and iron goods. Hantzschke is distinguished from these grounds. Chief towns, Vango, (the cap. Gray and Lave. It sends four members to the Ch., of the Registered electors, to 1860-1866 Total public revenue 1861 7,400,000 £ According to Hantzsch "Les habitants de la Haute Saxe apprennent que leurs esclaves sont les complémentaires, Français ou étrangers par suite d'arrêts passés de ce Prince républicain sans compensation par leur empire. Les habitants eux-mêmes ont le peuple Quillo-revante." Hantzsch Haute Saxe, French Official Guide.

assessed at less than 5 fr., 26,906 at from 5 to 10 fr., and 22,347 at from 10 to 20 fr.; and 269 at 1,000 fr. and upwards. Coal, iron, manganese, and marble are raised; the glass and iron works and potteries are important. The commerce of the dép. centres principally in Chalons-sur-Saône. This dép. is divided into five arronds.; chief towns, Mâcon, the cap., Autun, Charolles, Chalons, and Louhans. It sends 7 mems. to the Chamber of Deputies. Registered electors, 1838-39, 3,243. (*Dict. Géog.; French Official Tables.*)

SARAGOSSA, ZARAGOZA (an. *Cæsarea Augusta*), a city of Spain, kingdom of Aragon, prov. of its own name, in a fine plain on the Ebro, crossed here by two bridges, 87 m. S.E. Pampeluna, 156 m. W. by N. Barcelona, and 176 m. E.N.E. Madrid; lat. 41° 47' N., long. 42° 45' W. Pop., according to Mifano, 43,440. The limits of the town are marked by a wall partly of turf and partly of stone; and there are 8 principal and 2 smaller gates. It is divided into 4 quarters and 2 suburbs, comprising upwards of 200 long, narrow, ill-paved, and dirty streets; indeed, there is only one wide street in the whole city, viz. the *Cosco*, which sweeps round the outside circ. of the town on the land side, connecting the market-place and the Ebro. (*Cook's Sketches in Spain*, i. 109.) The houses, generally speaking, are of brick, and 3 stories high; but few of them have any pretensions to architectural display. The town has an immense number of churches, 2 of which are cathedrals, thus characterised by Mr. Townsend:—"That called *El Asen* is vast, gloomy, and magnificent, exciting devotion, inspiring awe, and inclining the worshipper to fall prostrate and adore in silence the God who seems to veil his glory; the other, called *El Pilar*, being spacious, lofty, light, elegant, and cheerful, inspires hope, confidence, complacency, and makes the soul impatient to express its gratitude for benefits received." (*Spain*, i. 206.) This church, however, was nearly destroyed during the siege in 1808-09; and several of the other churches and convents were then also destroyed. The chapter of the united cathedrals comprises an archbishop, dean, 12 dignitaries, and 30 canons. Among the numerous other churches, 16 of which are parochial, that of *Santa Engracia* is worth notice on account of its valuable paintings, sculptures, &c.; and the conventual church of St. Domingo, in the *plaza* of the same name, is remarkable for a fine altar-piece and mausoleum of white marble. There are 5 *hospicios*, or public almshouses, one of which, the *Casa de Misericordia*, has accommodation for 700 sick and aged persons of both sexes, and another affords a refuge for upwards of 1,000 orphans and foundlings. The exchange, near the *Puerta del Angel*, is an antique-looking, square building, ornamented with busts of the kings of Aragon, enclosing a spacious hall supported by 50 Doric columns, contiguous to which is the sessions-hall of the *ayuntamiento*. There are two sets of barracks, and in the suburbs are several extensive and well-planted walks. A little W. of the city is the fortress of *Aljaferia*, so called from its founder, the Moorish king Ben-Aljase, who made it his palace. A university was founded here on the expulsion of the Moors, in 1118, but was not incorporated till 1474: it was well attended at the close of the last century, but is now comparatively deserted. Among the other establishments may be mentioned, a royal economic society, with professors of chemistry and agriculture, botany, rural economy, &c.; a royal academy of the fine arts, a public library, and a *monte de piedad*. The manufacturing industry of Saragossa, once very considerable, has all but fallen to decay; the only manufactures, at present, being those of coarse woollen cloths, parchment, shoes, and leather. The town enjoys also considerable advantages for commerce, owing to its position in the midst of a fertile country, and on the canal of Aragon, which runs from near Tudela to Sagtogo: its trade, however, is confined chiefly to the transport of grain to Tortosa in exchange for articles of home consumption.

"On the whole, Saragossa may be said to be on the decline, like all the provincial caps., many of the old families having gone to hide their poverty at Madrid; and many magnificent houses, on a scale not exceeded any where in Spain, are now let out in tenements. Provisions of all sorts, corn, wine, oil, mutton, game, and vegetables, are cheap, abundant, and excellent, this being probably the best country for living in Spain. The people, generally, are civil and polished, as in all the old cities; but the lower classes have a bad reputation, and assassinations are said to be common. The peasants of the environs wear a Moorish costume, like those of Valencia, and in manners they are ruder and more ferocious-looking than almost any other peasantry of the Peninsula." (*Cook's Sketches*, i. 111.)

The climate is temperate and healthy, though somewhat damp; the neighbourhood produces good crops of wheat, barley, and maize, kidney-beans and other vegetables, wine, oil, fruits, and silk. The neighbouring hills depasture great numbers of sheep, chiefly belonging to the *Ganaderos* or sheep-grazers of Sara-

gossa, an old and highly privileged association. (*Townsend*, i. 206-212; *Cook's Sketches*, i. 108-111; *Modern Trav.*; *Mifano*, &c.)

Saragossa is very ancient, being said to have been founded by the Phœnicians or Carthaginians. It was greatly enlarged by Julius Cæsar, who made it the head quarters of the veteran legion; and Augustus gave it the name of *Cæsarea Augusta*, with the privileges of a free colony. Of its Roman buildings, however, which, according to Strabo, must have been numerous and handsome, there are scarcely any vestiges. Towards the close of the 5th century it was taken by the Goths, who were expelled in 712 by the Saracens; and at length, in 1017, it was made the cap. of a separate Moorish state. A century afterwards it was besieged and taken by Alphonso of Aragon; and it was subsequently united to the kingdom of Castile. But it is principally known in modern history from the obstinate resistance made by its inhabs., under Palafox, in 1808-9 to the French, commanded successively by Marshals Mortier and Lannes. The siege lasted, with some slight intermissions, from July 15, 1808, to Feb. 21, 1809.; when, after a loss of about 6,000 men killed in battle, and of above 30,000 men, women, and children carried off by hunger, pestilence, and the fanatical excesses that raged in the unfortunate city, it surrendered to the French. General Napier's account of this famous siege has stripped it of more than half the romance with which it was early invested in this country. The "heroic" Palafox "for more than a month preceding the surrender never came forth of a vaulted building which was impervious to shells, and in which, there is too much reason to believe, that he and others, of both sexes, lived in a state of sensuality, forming a disgusting contrast to the wretchedness that surrounded them." (*Napier*, ii. 49. 3d edit.) In obstinacy, fanaticism and savage cruelty, the Saragozans seem to have borne a striking resemblance to the Jews besieged by Titus. The loss of the French in the siege did not exceed 4,000 men.

SARANSK, a town of European Russia, gov. and dist. Penza, on both sides the Saranga near the Insar, 70 m. N. by E. Penza. Pop. 8,750. Most of its houses are of wood: it has, however, two cathedrals, nearly a dozen other churches, a convent, various manufacturing establishments, and a large annual fair. (See, also, PENZA.)

SARATOF, an extensive government of European Russia, between the 48th and 53d degs. N. lat., and the 42d and 50th E. long., having N. the gov. of Penza and Simbirsk, E. that of Orenbourg, S.E. and S. Astrakhan, and W. Tambof, Voroneje, and the country of the Don Cossacks. Length, and greatest breadth, about 350 m. each. Area estimated at about 73,600 sq. m. Pop., in 1846, 1,718,600. The Wolga intersects it from N. to S., dividing it into two portions of nearly equal size, but differing considerably in general character. The E. division is a wide steppe, destitute of wood, and covered in many parts with salt lakes, from one of which 10 million poods of salt are said to be annually obtained. The W. division is in part hilly, and though stony towards the S., has some tolerably fertile tracts in the N., where agriculture is the chief occupation of the inhabitants. Rye, wheat, oats, millet, and pease, are raised, and in ordinary years the produce, after supplying the demand for home consumption, leaves a considerable quantity for exportation. Potatoes, flax, and hemp, are also produced, and the cultivation of tobacco, hops, and wood, has been introduced by German and other colonists. The climate, in some situations, is sufficiently mild for the culture of the melon, grape, and mulberry. The principal forest trees are oaks, poplars, Siberian acacias, and firs. The woods are mostly in the N.W.; and those belonging to the crown are estimated at about 418,500 dectines; but the supply of timber is not adequate to the home demand. The rearing of live stock is conducted on a large scale; and the more wealthy proprietors are endeavouring to improve the breed of sheep, by the introduction of Merino flocks. The rearing of bees and of silkworms is on the increase. The fisheries in the Wolga furnish large supplies of fish, both for home consumption and exportation. Next to salt, mill-stones and a little iron are the chief mineral products.

The population is very mixed, including Tartars and Kirghizes, and on the Wolga are numerous colonies, founded principally by German and other immigrants from W. Europe; originally attracted thither by grants of land, and privileges conferred by the empress Catharine, in 1763. In 1811, their numbers amounted to about 55,000; and in 1838, they are said to have increased to nearly 118,000. The colonists are free, and in most respects subject only to their own jurisdiction. They conduct the most important manufactures of the government, which consist of linen, cotton, and woollen fabrics, hosiery, iron ware, leather, and earthenware. There are numerous flour-mills and distilleries. This government is favourably situated for commerce: it commu-

located by the Volga with the Nijni-Novgorod and the Caspian Sea, and by the Medveditza and Don, with the Sea of Azof. The Tartars have a large trade in sheepskins, and the Kalmucks in horses of a very fleet, though weak breed. About 5,000 merchants, trading in corn, salt, fish, caviar, cattle, tobacco, and fruits, had a few years since an aggregate capital of 11,175,000 roubles. Saratof is divided into 10 districts; chief towns Saratof, Voisk, and Tzaritsyne. The population are mostly divided among the Greek, Protestant, and Mohammedan religions. Education, except in the schools of the colonists, and of the capital town, is at a very low ebb; and in 1830 there was but one printing-press in the government.

SARATOF, a town of Russia in Europe, cap. of the above gov., on the Volga, 335 m. S.S.E. Nijni-Novgorod, and 360 m. N.N.W. Astrakhan. Lat. 51° 31' 34" N., long. 46° E. The pop. (including military), according to the official accounts, exceeds 35,000; but this is believed to be beyond the mark. It consists of an upper and lower town; but, though founded so late as 1665, it is neither regularly laid out nor well built. It has some good and even handsome stone residences; but most of its houses are of wood, and it has frequently been in great part destroyed by fire. There are about a dozen Greek-Russian churches, some convents, a Protestant and a R. Catholic church, a mosque, and a *gostinõi-dvor*, or bazaar, a large stone building for the warehousing, exhibition, and sale of merchandise. Since 1833, a new and handsome archbishop's palace has been constructed; and there are several hospitals, a gymnasium, and an ecclesiastical seminary, established in 1828, and having at present (1841) about 500 students. The inhabs. manufacture cotton fabrics, cotton and silk stockings, clocks and watches, leather, wax lights, tallow, vinegar, beer, &c. Saratof, which is intermediate between Astrakhan, on one hand, and Moscow and Nijni-Novgorod on others, has an extensive trade, its exports being principally corn, salt fish, hides, cattle, and native manufactured goods; and its imports, tea, coffee, sugar, iron, glass, and earthenware, woolen, silk, and cotton stuffs, peltry, &c. It has three large annual fairs. (*Schmitzler, La Russie; Passari, Les Kaiserth, Russland*, p. 591—616.)

SARATOGA SPRINGS, the great watering place of the U. States, in the state of New York, co. Saratoga, 34 m. N.W. Albany. Resident pop. in 1840, 2,500. This incorporated village consists of a fine broad street fringed with trees, and has many large and excellent hotels, a Presbyterian church, post-office, and numerous boarding houses. The springs, which came into repute through the Indians in 1767, are spread over a tract 12 m. across. Congress-spring, the most celebrated, was discovered in 1792. A gallon of its water holds in solution 385 grains of sea-salt; 3.5 do. hydriodate of soda; 8.982 do. carbonate soda; 95.788 do. bi-carbonate magnesia; 10. carbonate lime; 5 do. carbonate iron; and 1.5 do. x. Above 1,500 people have been known to arrive in a week, coming from all parts of the states, even from New Orleans, a distance of between 2,000 and 3,000 during the unhealthy season in the S. States. A profitable trade is carried on by the proprietors of several springs in the water, which is bottled and sent to distant parts. The spring water loses its punch, however, and its iron is entirely deposited, by being too long kept in bottles.

The vicinity of Saratoga is especially interesting, from being the scene of one of the leading events in the history of independence, the surrender of General Burgoyne, the British troops under his command, to General Clinton, 17th Oct. 1777. (*New York Gaz.; Stuart's America*, 189, 190.)

SARDINIA (Ital. *Sardegna*, Fr. *Sardaigne*, an. *Ichthyia*), from its resemblance to the print of a foot, *posterior*), an island of S. Europe, and next to Sicily, it nearly equals in size, the largest in the Mediterranean. It lies principally between the 39th and 42d degs. of N. lat., and the 8th and 10th of E. long., separated from Corsica on the N. by the Strait of Bonifacio. It is of an oblong form; length, N. and S., 160 m.; average breadth, about 60 m.; area with dependent islands, 9,240 sq. m. Pop., in 1844, 543,207. Sardinia differs from Corsica in being more diversified, more fertile, and richer in minerals. A large proportion of its surface is hilly or mountainous. The principal mountain chains extend from N. to S. at no great distance from the E. coast; but in various parts of the island there are ranges of considerable length stretching in opposite direction. The general elevation of the island is from 1,000 to 3,000 ft.; the peak of Limone, however, is 3,686 ft., and that of Genargentu, in the N. of that name (the *Isani Montes* of antiquity), in height, an altitude which enables the people to trade in snow for the consumption of the island. (*Smyth*, p. 67.)

There are many extensive plains, the principal being the Ozieri and Sassari in the N., that watered by the Cagliari in the centre, and the Campidano, between

Oristano and Cagliari, in the S. The Tiri, Finmen-doso, Coguinis, Mannu, &c., flowing through these plains, are considerable rivers: the minor camps are watered by numerous small streams. Around the coasts are many lagoons, and several considerable bays, as those of Cagliari, Oristano, Sassari, Orisai, &c.

The mountain-chains of Sardinia and Corsica have a similar formation, being composed of granite, schist, primitive limestone, &c. Through the centre of Sardinia, from N. to S., extends a remarkable tertiary formation of a calcareous nature; and various volcanic products are scattered over this formation, while the traces of extinct craters are visible in many parts of the island. Earthquakes, however, are rare; nor are storms frequent, though the climate is proverbially variable as to temperature. According to Capt. Smyth the mean temperature of the year, at the level of the sea, may be taken at 61.7 Fah., and the medium height of the barometer at 29.69.

Extensive districts are very unhealthy, and in antiquity the island was celebrated alike for the excellence of its soil and the badness of its air. *Sardinia fertilis, et soli quam ceteri melioris; atque ut secunda, ita pene pestilens.* (Pomp. Mela, lib. ii. cap. 7.) "The intemperie, as the malaria is here called, appears to be somewhat different from the malaria of Italy and Sicily; for though equally, or even more acrimonious in effect, it does not always produce the swelled bodies and sallow skins which are the symptoms of the latter. Both diseases usually commence when the summer heat, assisted by light showers, disengages the impure gases from the low grounds, and continue until the latter end of November, when heavy rains have precipitated the miasma, and purified the air. But they differ, inasmuch as malaria is generally supposed to be weak in its effects unless imbibed during sleep; whereas intemperie, though worst at night, is pernicious at all times." (*Smyth's Sicily*, p. 82.) The chief source of insalubrity appears to consist in the exhalations from the numerous marshes and stagnant pools of the plains, and might, therefore, it may be fairly concluded, be greatly abated by a proper system of drainage. Fire is said to be a powerful antidote against the evil; and the lords of Oristano were formerly accustomed to light large fires round the town, which had the effect either of rarefying or destroying the mephitic vapours.

Notwithstanding her extent, the richness of her soil, her position in the centre of the Mediterranean, and her convenient harbours, Sardinia has been strangely neglected, not only by her own governments, but by the European powers generally; and has remained, down to our own times, in a semi-barbarous state. A long series of wars and revolutions, followed by the establishment of the feudal system in its most vexatious and oppressive form; the fact of her having been for a lengthened period a dependency of Spain, and, if that were possible, worse governed even than the dominant country; the division of the island into immense estates, most of which were acquired by Spanish grandees; the want of leases, and the restrictions on industry, have paralysed the industry of the inhabs., and sunk them to the lowest point in the scale of civilisation. Since 1780, however, improvements of various kinds have been slowly, but gradually gaining ground; and, within the last few years, several important and substantial reforms have been introduced, that will, it is to be hoped, conspire to raise this fine island from the abyss into which it has been cast by bad laws and bad government.

Besides that portion of the island occupied by lakes and marshes, there are large sandy or stony districts, called *macchie*, which comprise, in the aggregate, more than 1-3d part of the island: a similar extent may be assigned to forests and pastures; the remaining portion of the surface being laid out in corn-fields, vineyards, olive-grounds, orchards, gardens, &c. About 1-5th part of the cultivated land is supposed to be allotted to the growth of corn, which, even under the present system of agriculture, is said to give a return of 7 or 8 for 1; and, in some favoured districts, the average is said by Smyth to amount from 16 to 50 for 1. Of the capacity of the island for producing the most luxuriant crops of corn, there can, indeed, be no manner of doubt. In antiquity, Sardinia was reckoned, along with Sicily, a granary of Rome. "*Siciliam et Sardiniam benignissimas urbis nostras nutrices.*" (Val. Max., lib. vi. cap. 6.)

Utraque frugiferis est insula nobilis arvis.
Nec plus Hesperiam longinquis membris ullas,
Nec Romana magis complebant horrea terras.
Lucan, iii. l. 65.

But the unfavourable political and municipal regulations under which the island has latterly been placed, have gone far to neutralise the advantages it owes to nature. The agriculturists of Sardinia principally consist of two great classes — those who cultivate small farms on the *métayer* principle, and those who work on the estates of others, getting, in most instances, a patch of land for their support, and cultivating it at such times as they

are not employed on the lord's lands. Both classes are excessively poor. The agreements under which the farmer class hold are seldom for more than a year; the landlord furnishing the seed as well as the land, and receiving half the produce. Those who occupy land for which they are obliged to pay a rent in services, or other feudal services, are, if possible, still worse off, having usually to borrow the seed either from the landlord or from the *Monti Frumentarii* established for that purpose, and having also to defray the tithes and a host of other burdens. Another disadvantage, under which all classes labour is the want of houses on their farms; the peasants live together in villages, and have frequently to perform a journey of several miles in going to and coming from their farms. Probably, also, this may, in some degree, account for the frequent change of occupation by the Sardinian peasants; though, as *Marmora* has truly observed, their circumstances are rarely improved by such changes.

Land belonging to a master or commons are frequently cultivated on a kind of partnership system, being divided into three portions, one of them, called *comune*, comprises all the lands that are in cultivation, and which are distributed by lot among certain individuals, while the other two portions are occupied in common as pasture. But, as a new distribution takes place every year, it is plain that no individual can take any interest in the improvement of the soil, and this sort of tenure becomes, in fact, the most effectual that can be devised for the cultivation of industry. Lately, however, the government has been making efforts to promote the formation of *terziopartite* and the division of the lands, which, though opposed by the prejudices of the people, have made some progress. (*Marmora's Voyage en Sardaigne* liv. v. cap. i.)

Even these, however, are not perhaps the greatest discouragements to agriculture. As if to annihilate the possibility of the peasantry emerging from their depressed condition, and to oblige them to devote their industry to the supply of their indispensable wants, it has been enacted that no corn shall be exported if its price exceed 30 reals the *stovella*, and a heavy duty is laid on all that is exported, as a substitute for a general land-tax. Most other articles of export have been loaded with similar duties, and it would really seem that every device that ignorance and short-sighted rapacity could suggest had been practised to reduce this "benighted nation" of imperial Rome to a state of poverty and destitution.

Happily, however, the bounty of nature has proved an overmatch for the perverse ingenuity of man, and such is the fertility of this fine island, that, notwithstanding the influence of the duty now referred to, and the wretched system of agriculture, it exports in good years about 400,000 *stovelli* or 400,000 bushels of wheat, 200,000 of barley, 6,000 ditto maize, 100,000 ditto beans, 300,000 ditto peas, and 1,000 ditto lentils. The culture of the vine is gradually increasing in importance, and about 8,000 *Catalan* pipes are exported, chiefly from Alghero and Ogliastra. Olive oil, owing to the little care taken in its preparation, and its consequent bad quality has hitherto been but little exported, but it is susceptible of an indefinite increase, and might be made an important article. Tobacco is a royal monopoly and brings about 600,000 lire a year into the public treasury. Flax, flaxseed, cotton, hemp, and basilla are grown to some extent: silk is produced only in limited quantities, but its produce might, no doubt, be easily increased; some

which had been cultivated or applied to use, whether enclosed or not, were assigned to perpetuity to the occupiers, undisturbed possession being held to render a sufficient right to the property in the absence of any other title. Those whose interests were at all affected by the new changes received compensation in money or lands, or by an assignment of public funded property. The king substituted himself in the place of the barons: he took all the feudal rents into his own hands, and their value being estimated at 30 years' purchase, public subscription to the amount, bearing five per cent. interest, were made over to the nation in exchange for the privilege of which they had been deprived. All kinds of vassalage were, at the same time, made redeemable, and courts of law placed under the direct control of the state were constituted in the place of the feudal jurisdictions where the barons were at once vassals and judges. It is impossible to overrate the importance of these changes; and there cannot be a doubt that they will have the greatest and most beneficial influence. (*See Roscher, Finis*, &c. i. 300-301.)

The greater number of the cows, horses, and other live-stock, wander wild over the island, bearing the mark of their owners, and browsing in the woods in winter, there being no wolves. They are generally, as might be expected, very inferior; but considerable pains are taken in the breeding of some descriptions of horses, and horse-races are a prevalent amusement. It is singular, notwithstanding the badness of the roads, that mules should be unknown. The Sardinian sheep is said, by *Marmora*, to be remarkable only for its dryness: its wool is of a very low quality, and is worth little, except in the island. Cheese, made of the milk of sheep and cows is sometimes exported, but this is

little, but of its exact number of these sheep, and 400,000

ing, *Stat. Nat. M.* will suppose the Sardinia. It is a very the highest and in its quality and The form of the is modified with the upper, and is, moreover. The horses are

neither full nor handsome, but hollow, and probably similar to those of the run, while the bear is the same: it propagates also very readily with the sheep, the wild produce being the "ambrò." Though as dry in the wild state, the mouflon soon accommodates itself to domestic habits" (*Smith*, p. 120). Deer, wild boars, and a variety of game abound in the forests; and the skins of about 30,000 rabbits and hares, from 4,000 to 5,000 skins, and 2,000 martens, are annually exported, besides 5,000 carcases of marmoset, or dried chimera, for making glue.

Though various improvements have been effected of late years, it is still true that the interior of this island exhibits, at this moment, a degree of barbarism which can with difficulty be believed to exist in Europe. The shepherds, and others who occupy the mountainous parts of the island, are in the habit of wearing only coverings of tanned leather, or of chaggy goat or sheep skins. They are constantly armed to protect themselves from banditti, roaming with their flocks over the uninhabited tracts, enjoying a bare subsistence, and unacquainted with no laws but those of their own formation. They sometimes sow small patches of wheat and barley round their temporary dwellings, but they subsist chiefly on fruit, game, and the produce of their flocks, such finally constituting as it were a patriarchal association. Though this part of the pop. be inefficient, the number of banditti in the mountains formerly rendered it unsafe for any one, whether a foreigner or Sardinian, to venture far into the interior without an escort; and the farmers in the plains have been accustomed to rely for protection from the depredations of their highland neighbours on a long established corps, called the *harnacelli*. This is an armed association, chosen annually in the village districts, the members of which are bound to make restitution for all thefts, provided they receive immediate information of the robbery. Their remuneration arises from an annual sum subscribed by every landholder. An attempt was made by the government, in 1815, to disband this force, but it was unsuccessful, and, on the whole, the *harnacelli* are well adapted to the condition of the country.

The banditti that have long infested and still continue to infest parts of this island, owe their origin to a variety of causes, among which, no doubt, may be included the influence of the feudal system, and the opportunities afforded by the state of the country, full of natural fortresses, without roads, and without an efficient system of police, for their carrying on their depredations with impunity. Lately, however, some stringent measures have been adopted for their suppression. The privilege of

the state were assigned as on one property to themselves, commoners, or the crown; the latter becoming the possessor of all waste lands, or those to which neither private parties nor commoners could show any title. Lands

greatest interest is great business declined. There has been such an increase that we were previously handicapped. In fact, our work has been restricted, and this means, coupled with the abolition of the State Council, and the establishment of royal courts for the study and new equal distribution of justice, will, probably, in a very important period, go far to improve the relations and communications which have so long distressed the State.

The beams of the passagery are most wretched, extending nearly if not quite without windows, or, if there be windows, they are not glazed. A whole family frequently dwells in a single room in which beds, tables, and stools, and (inadvertent) commode-ware with the usual chairs, whilst an one is usually employed serving a few well (made) customers to the counter. The centre of the room has a square hole in the flag floor for the fire, but there is no outlet for the smoke except narrow holes in the roof or door. A few small low stools, with an equally low table, constitute the usual furniture. Earthware are not lacking, the ordinary substitutes in an eating wooden dish. More dish to cook them in dirty, but less potent. Consists of curries, &c., and few vegetables, are served without oil.

The fish on diets are mostly quillfish. These become rare; it was taken, but not, from the fish. The big fish are smaller, and to arrive at the fisheries on wearing, only the smallest

hardness has one of silver, copper, lead, and iron, which, if wrought, would, it is believed, be among the most valuable of her resources. But the mode of regulations for the working of the mines proves an efficient stimulant to all mining operations. It assigns operators to work their mines under the direction of government engineers, or officers of the royal corps of miners, who are to be consulted and furnished with plans on the question of smelting salts &c. Speculators are also protected from exporting for sale, or exporting the produce of their mines, without permission from the Intendant civil, and are bound to keep a journal of the daily rate of their mines the same to be exhibited in a public statement monthly at the Intendant's office of the district. (*Moniteur's Report*, 74.) The custom in that mining, and the quarrying of the fine very beautiful marble, &c. of the island, is almost entirely neglected.

is a royal monopoly, and affords a considerable one. I will recently bought about all the oil of this article from Sweden, and a quantity reported in considerable quantities. It is obtained from vegetation, principally near Cagliari. The oil is used by governments in painting and in the oil of the crown the oil, whereas the continental oil of the crown buy only thousand units at 30 at units each.

members of Georgia has long been stationary, as

that a statement of the trade in 1936 will be fairly applicable to the present time. In that year the value of the principal articles of export and import were estimated as follows:—

The customs duties received in the above year amounted to 995,500 fr. (Meyers, 699.)

Amovets (when not estimated, as above, by census) are kept in live, cold, and desert: the live of 20 cold and 20 desert = about 1.00, the rest of 2 cold = 0.04, the seeds of 10 red = 0.04. The *Sardinia* is, of 10 in = 1.00, 6 in = 0.04, the rest = 0.04. The *magpie* or *starling* (of 10 in) = about 1 bush, 1 part. The *quince* = 100 Bush, 1000; the *starling* or *magpie* (of 10 in) of *Capitula* = 3 seeds 10 parts 10 parts; of *Sardinia* 1 seed 10 parts 10 parts.

Bahamas is governed by a viceroy, whose commission generally lasts for 3 years, and who is the chief of the civil and military administrations, and the commander of the forces both by land and sea. The island is subdivided into 3 grand divisions, those of Capital, Nassau, and New Providence, and into 11 provinces subdivided into districts and parishes. The viceroy, chief, or principal towns are under the administration of the magistracy, consisting of justices, each composed of 3 members. Each town has a council of 2, 4, or 7 members presided over by a magistrate. The Williams Bank, created in 1694, and reformed in 1825, is the highest tribunal in the island. It is composed of 16 judges and 9 prosecutors, and is divided into 5 chambers, 3 civil and 2 criminal, and has at its head the viceroy, the 3rd Secretary to the island after the viceroy. Besides its functions as a supreme judicial court, it participates in the legislative power the degree of the viceroy published with the concurrence of the Williams Bank, having the force of laws. Nassau has a tribunal resembling the 1st division Bank of Capital, to which appeals may be made from its decisions. In the two other divisions are tribunals of commerce. In the provinces justice is administered by justices, whose decisions are final in civil cases to the amount of 10 small, and who have primary jurisdiction in criminal cases. The courts, or district tribunals, have a very limited jurisdiction.

Sardinia has a parliament, called the *Stamenti*, consisting of three chambers: the constitutional, selected from the provinces; the ordinary chamber, comprising all the nobles, 30 years of age, with or without rank; and the royal chamber, composed of the deputies of the towns and communes under the apex of the capital. The *Stamenti* are convened and holden during the king's pleasure but meet only on extraordinary occasions. Each chamber holds its sittings apart; and after separately discussing the matter under debate, they transmute by deputies. The deliberations of the constitutional body, respecting donations, must be submitted to the king for his approval, before passing into a law. The Supreme Council of Sardinia has its seat in Turin. It is composed of a president and five councillors, and is similar to the ancient Supreme Council of Aragon. Beyond this tribunal there is no appeal; and it gives its opinion in all state affairs transmitted to it from the government of the island. (*Report on Sicily and Sardinia*, p. 77.)

The laws of *Florida* are partly comprised in the code entitled the *Código de Leyes*, promulgated in 1833, and said to be drawn up, considering the period when it was issued, with great discretion and good sense. It has, however, been naturally modified by the successive acts of the Legislature, the edicts of the different sovereigns of the house of *Spain*, and the progress or duration of the viceroys. In consequence of the numerous and in many instances conflicting enactments that have thus been issued, the law has become exceedingly obscure. The numerous litigation, and the delay in, is fact, to see the feasible operation of *Maritime*, one who undoubtedly goes to sleep (20). Resources is had to the courts to determine the most trifling questions; and unfortunately the means of legal redress are at once tedious, expensive, and uncertain. — The country judges are extremely poor, and venality is so common, that judgments are just and equitable only when the government takes a criminal matter in hand. This is one of the leading causes of the examinations that have so straggled the land. It is

an acknowledged difficult task to work a reform in detail; for if a magistrate prove himself more than usually active in his office, he is sure to receive the vengeance of adverse partisans; and the effect of the whole system and practice is a melancholy want of security both of persons and property." (*Smyth*, p. 135.)

Nothing, in fact, would do so much to put down crime, and to restore security and good order to the island, as the simplification of the law, and the nomination of superior and responsible judges. And now that the government has begun the work by the suppression of the feudal system, it is to be hoped that it will apply its energies to a reform of the abuses in the judicial system.

No religion, other than the Roman Catholic, is tolerated in this island; and the secluded position and ignorance of the people have prevented the growth of any heresy, so that in this respect Sardinia boasts a higher purity than even Rome herself.

The island is divided into 3 archbishoprics; those of Cagliari, Sassari, and Oristano; and 8 bishoprics. Tithes are rigorously exacted. The revenues of the church are estimated by Serristori at 960,000 Italian lire, of which sum the secular clergy, amounting to between 1,800 and 1,900, receive about 264,000. According to Marmora (p. 324), there are 90 conventual establishments for monks, of whom there are about 1,120; and 14 similar establishments for nuns.

Public education in Sardinia has, of late years, been considerably improved. "There are now normal schools in each of the 10 provs., attended by about 6,650 pupils. There are, besides, secondary schools in the two principal towns, Cagliari and Sassari, which are frequented by about 1,350 students. The university of Cagliari reckons about 265 students, and that of Sassari 225. The course of studies is divided into theology, jurisprudence, philosophy, medicine, and surgery. By an ordinance of the late king, in 1822, every village or commune has now a gratuitous school for reading, writing, arithmetic, religious instruction, and the elements of agriculture. The effect of the diffusion of instruction among the people, aided by a better system of administration and police, is already visible in the decrease of crimes, especially murders, which, from the frightful amount of 150 yearly, in a pop. of about half a million, had been reduced in 1828 to 90." (*Journ. of Educ.*, vol. iii. p. 23.)

A voluntary regiment of 1,400 chasseurs is levied and maintained in Sardinia, for the service of that island. Respecting the rest of the armed force, &c., the reader is referred to SARDINIA, KINGDOM OF.

The finance department is managed by an Intendent-general in Cagliari, and vice-intendent in Sassari, and a sub-intendent in each of the other provs. The public revenue may at present (1850) be estimated at about 4,300,000 lire, or 172,000*l*. Of this sum about 2,000,000 lire is derived from customs duties, 800,000 do. from the tobacco monopoly, and 420,000 do. from salt works.

According to Captain Smyth, there is a striking resemblance between the Sards and Greeks. "It is impossible," he says, "for any one who has travelled in Greece, not to be struck with the similarity which, in many points, exists between the Sards and the Greeks. Not only are their arms, music, dances, dresses, and manners in close resemblance, but many of their words and superstitions are exactly the same; so that the opportunities I have had of comparing the two nations, would lead me to infer the partial identity of their origin. The Sards are of a middle stature, and well-shaped, with dark eyes, and coarse black hair; except in the mountains, where fresh complexions and blue eyes are met with. They have strong intellectual faculties, though uncultivated, and an enthusiastic attachment to their country. They are active, when excited, but extremely indolent in general. Their good qualities are counterbalanced by cunning, dissimulation, and an insatiable thirst for revenge." (*Smyth's Sardinia*, pp. 141-192, &c.)

Though vassals in Sardinia could change their lord and residence at will, the degrading services and tenures of feudalism were in full vigour in most parts of the island down to its abolition in 1839. The dependence of a peasant on his lord commenced when he was deemed capable of earning his bread; and an annual tribute, either in money or kind, was exacted from all above the age of 18; and this, in addition to the usual imposts on lands and stock; the contributions demanded for prisons, robberies, arson, and exemptions from the *roadia*, or one day's personal labour, as well as from other dominical services. These feudal burdens, with tithes, taxes payable to the king, alms, as they are called, to mendicant monks, and other grinding extortions, amounted, in many instances, to nearly 70 per cent. of the earnings of the peasant. And if, to this amount of taxation, be added the vicious customs that have prevailed in the letting of land, unintelligible laws, and venal judges, need we wonder at the poverty and semi-barbarism of the peasants, and that revenge has become, in their estimation, a sacred duty.

The Sards are enthusiastically fond of poetry, but the other fine arts have met with no encouragement; and there is not a native painter, sculptor, or engraver, of any eminence in the island; and the press being under a rigid censorship, the current literature, if so it may be called, is beneath contempt. The language of Sardinia is that dialect of the Italian, which preserves the greatest portion of Latin.

We have little authentic information respecting the history of this island previously to its conquest by the Carthaginians, from whom it was taken by the Romans in the third Punic war. On the fall of the Western Empire, it was successively possessed by the Vandals, the Goths, the emperors of the east, and the Moors; from whom it was taken, in 1022, by the Genoese and Pisans. It continued to be a subject of contention between these rival nations till 1325, when it was taken possession of by the kings of Aragon, and it remained attached to the Spanish monarchy till 1714, when, by the peace of Utrecht, it was ceded to Austria. In 1720, the latter exchanged it for Sicily with Victor Amadeus of Savoy. Previously to the French Revolution, the Sardinian government is said to have been desirous to sell the island to the Empress of Russia for 1,000,000*l*. sterling; but the scheme was defeated by the interference of France and Spain. (*Young's Travels*, ii. 256.) It was unsuccessfully attacked by the French in 1793; and on the seizure by the latter of the continental portion of the Sardinian dominions, Cagliari became the residence of the royal family. Recently, as already seen, measures which promise to be of the utmost importance to the island, have received the sanction of the government. (For further information, see Marmora, *Voyage en Sardaigne*, Paris, 1826, an elaborate and valuable work; *Smyth's Present State of Sardinia*, in great part derived from the former; *Parl. Report on Sicily and Sardinia*; *Dict. Géog.*; *Serristori, Statist. d'Italia*, &c.)

SARDINIA (KINGDOM OF, Ital. *Stati Sardi*), a state of S. Europe, comprising the whole of N. Italy W. of the Tessino, including the territory of Piedmont, Genoa, and Nice, and the adjacent duchy of Savoy on the W. side of the Alps, with the island of Sardinia in the Mediterranean, nearly the whole of these dominions being included between the 39th and 46th degs. of N. lat., and the 5th and 10th of E. long. Its divisions, area, pop., &c. are as follow:—

Divisions.	Area in sq. m.	Pop. census of 1838.	Pop. to sq. m.
Savoy	4,270	564,137	132.1
Turin	3,186	873,310	274.3
Coni	2,712	566,181	208.7
Alexandria	2,039	593,563	292
Novara	2,692	542,728	201.6
Nice	1,619	220,718	142.5
Aosta	1,234	78,110	63.3
Genoa (and Capraja)	2,103	674,988	320.6
Island of Sardinia, &c.	9,241	524,633	57
Totals	29,102	4,660,568	160

The insular portion of this kingdom being described under the previous article, we have now to deal only with the continental portion, lying between lat. 43° 40' and 46° 24' N., and long. 5° 35' and 10° 5' E., having W. France, N. Switzerland, E. Austrian Italy and Parma, and S. the Mediterranean. The Alps separate this territory into three great divisions: Piedmont in the centre, forming the upper part of the valley of the Po; Savoy, a rugged and mountainous region on the W. and N.W.; and the prov. of Genoa, Nice, &c., in the S., between the Maritime Alps and Apennines, and the sea.

The most valuable portion of the kingdom is the plain of Piedmont, extending from the foot of the Alps to that of the Apennines on the S., and to the Tessino on the E. The soil is every where a rich, sandy loam, with little appearance of clay, and of great fertility. Owing to the heat of the climate in summer, water is here the great desideratum; and advantage has accordingly been taken of the numerous streams that pour down from the mountains, which are distributed with infinite skill all over the low grounds. Nowhere, indeed, is the art of irrigation carried to greater perfection than in that part of the great plain of the Po included in Piedmont. "Water is here measured with as much accuracy as wine. An hour per week is sold, and the fee simple of the water is attended to with the same solicitude as that of the land." (*Young*, ii. 160.) The irrigated lands being under the influence of a southern sun, produce the most luxuriant crops.

Lands in Piedmont are mostly inclosed, generally by ditches, but, in many parts, with hedges also, which in some districts equal those in the best English coe. The crops, however, are generally divided by lines of fruit trees of different kinds, intermixed with mulberry trees, poplars, and oaks; and that the benefit of these trees may not be limited to the shade they produce, they support vines. Speaking generally, farms in Piedmont are small, and are usually held on the *saffayer* system, the

landlord receiving half the produce, and paying the taxes and repairing the buildings. On the whole, however, the agriculture of this part of the Sardinian dominions bears so close a resemblance to that of the rest of Lombardy, that we beg to refer the reader for farther particulars to the art. ITALY (AUSTRIAN) in this vol.

Few countries have so large a disposable produce as Piedmont. It has an immense number of cities and towns; and yet the Riviere of Genoa, Nice, and the country as far as Toulon, are supplied with corn and cattle from its superabundant produce. The produce of maize is considerable; and it constitutes the principal support of the country population, who make use of it under a variety of forms. The most usual course of husbandry consists of what would be called in England a four-shift, the first year being maize, the second wheat, the third clover or fallow, and the fourth wheat. It is customary to mix French beans and hemp along with the maize. Wheat is sown on narrow ridges, and is earthed over by the plough; which in Piedmont is an implement of a better kind than in most parts of Italy. Wheat harvest takes place in the beginning of July: it is thrashed by means of cylinders drawn by horses over the straw, which is turned up by forks. According to Arthur Young (ii. 209.), the common produce of the wheat crops in Piedmont does not exceed six times the seed; which, considering the quality of the soil, he is justified in calling "miserable;" but the better crops yield between 10 and 11 seeds, or even more; and with a better rotation, and more care, this might be made the average produce of the plain.

To the corn crops must be added those of hemp, which is sometimes considerable, and silk, for which Piedmont is famous, with wine, vegetables, and fruit; the produce of the farm-yard, and the profit of rearing and fattening stock. The latter branches are the principal sources of profit from cattle; for though the latter be very abundant in Piedmont, the farmers have not learned, like those of the Milanese, to derive much advantage from their milk. A farm of medium size was estimated by Chateaueux to consist of about 60 acres, 1-4th being in pasture. Such a farm would support a family of 8 or 9 persons, maintain upwards of 30 head of live stock, produce silk to the value of 25*l.* a year, and more wine than was required for home consumption. The crops of maize and French beans go far to maintain the labourers, so that nearly the whole crop of corn may be carried to market, as well as a considerable quantity of the inferior articles. (*Chateaueux*, 30, 31.)

Savoy, which is remarkable for the grandeur and beauty of its scenery, though a poor country, produces enough to supply the wants of its inhabs. The peasants are all, or mostly all, proprietors. The plough is of use only in the valleys; on the high grounds the peasants break up the soil with the pick-axe and spade, and, to improve it, carry up mould and manure in baskets from the valleys. Small reservoirs are prepared near the tops of the hills and mountains, from which water is let out at pleasure in spring and summer; while, to prevent the earth from being washed down the declivity, wall stone walls are erected, so that, by dint of skill and industry, cultivation is extended over tracks which would otherwise be a continued surface of naked rock.

Wheat, oats, barley, rye, and hemp, are the principal grains cultivated: in some favourable situations the vine is grown; and the white wine of Montmelian is especially esteemed. The walnut is the olive of Savoy, supplying the inhabs. with oil, not only for home consumption, but also for exportation to France and Geneva. The kernels are crushed by a mill, into a paste; which is pressed to extract the oil, and afterwards dried in a called *pâte amère*, eaten by children and poor people. A good many cattle and sheep are reared, and sent for sale into Piedmont and Lombardy. The butter and cheese of Savoy are of good quality, and are important products. Many mules and horses are bred for transit trade between France, Germany, and Italy. The olive, though but little grown in the other parts of the kingdom, is the chief article of culture S. of the Alpes. The land in the Genoese territory is generally hilly and rocky; but has mostly a S. aspect, suited for the olive and the vine. The cultivated land is said to comprise about 1-4th part of the surface. And here is divided into very small farms, those near the towns comprising only about 6 acres, and those in the interior about twice as much. Only a small portion of the land is cultivated by proprietors: it is let on leases of 3, 5, 7, or 9 years, but never more. The rent of cultivated land near Genoa is very

In the greater part of the Genoese territory the rent is paid in cash or in produce, as wine, oil, grain, &c. rated at a fixed price; but in the provs. of Novi and Lavante the rent is paid, as is usual in the rest of the kingdom, on the *metayer* principle; the landlord furnishing the land and 1-3d the seed, and receiving 2-3ds the produce. Wheat and maize are generally sown alternately on the same land: and good land is said to yield usually from 4 to 6 for 1, or double that quantity when it is tilled with the spade, as is customary in some parts. Each farm of 4 or 5 acres supports a family. Labourers get from 3*l.* to 5*l.* a year, with board and lodging. Their usual diet consists of Indian corn, chestnuts, potatoes, beans, and fruit; making little or no use of butchers' meat. Women work in the fields, and tend the cows, in addition to spinning, weaving, and other domestic work, in which they are very industrious. The occupiers of farms are not in a prosperous condition; and we may add, that they never will be in such condition while farms are so very small, and held under such a tenure. Paupers, however, are more numerous in the towns than in the country. The government makes no provision for the support of the poor; but there are various private charities for their assistance. (*Parl. Rep. on Agriculture*, 1836.)

I. II.

The mineral riches of this country are little explored; but iron of good quality, lead, copper, sulphur, manganese, and cobalt, abound in the mountains of Piedmont and Savoy. The mines of Pessey, in the Tarentaise, formerly yielded from 30,000 to 40,000 cwts. of lead, and about 4,000 marcs silver a year. Alabaster, fine marble, serpentine, slate, &c. are plentiful. Salt is found both in mines and in springs; and near Moutiers are government salt-works, said to produce 3,000,000 lbs. a year. There are some forges, and other iron-works; but the principal manufactures consist of silk stuffs, velvets, and stockings, mostly consumed in Italy. Coarse woollen and linen goods are made in several provs.; and coarse stuffs for the rural pop. in Savoy. Sail-cloth, cables, house furniture, paper, white lead, glass, earthenware, optical and surgical instruments, jewellery, and works of art and *virtu*, are among the articles made at Genoa, Nice, and other principal towns; and there are numerous brandy and liqueur distilleries, and tanneries.

Trade.—The great articles of export from the Sardinian States consist of raw and thrown silks, with silk stuffs and velvets, which are largely produced at Genoa; then come olive oil, woolsens, paper, rice, vermicelli, and a variety of inferior articles. The leading articles of import consist of corn from the Black Sea, principally for the supply of Genoa and the surrounding district; raw cotton and cotton fabrics, sugar and coffee, indigo and other dye stuffs; hardware, cutlery and iron; salt-fish, tobacco, &c. It is difficult, however, to form any fair estimate of the trade of the kingdom; for, on the one hand, a large proportion of the imports are not destined for the use of the country, but are merely received *in transitu* for France, Switzerland, Germany, &c.; while, on the other hand, a considerable, though a less, proportion of the exports, consists of products from the adjacent territories; and no distinction is made in the official returns between the portions of the imports and exports now referred to. In 1843, the total value of the imports was estimated at 186,000,000 lire, and that of the exports at 158,000,000 do. Genoa, Nice, and Cagliari, especially the first (which see), are the principal seats of the foreign trade of the kingdom.

All transit duties on goods passing through the Sardinian states have been abolished. The duties on consumption in the interior of the kingdom are moderate. The imports of corn are principally from the Black Sea, but partly also from Sicily.

Government.—Down to 1849, the government was purely monarchical. It deserves credit for having constantly endeavoured, for a lengthened period, to restrain the extravagant privileges of the nobility, clergy, and corporations, and to enlarge the rights and immunities of the bulk of its subjects. Hence, says Count Pecchio, "Piedmont was the first country which, in 1729, abolished nearly the whole system of feudal authority and personal service, leaving scarcely any but honorary privileges in force. It then also limited the right of primogeniture and of entail, and consequently gave greater scope to the free cultivation of the soil; and diminished the powers of the clergy, more particularly that of investing land in mortmain. These constitutional reforms were revised and confirmed in 1770." (*Hist. of Pol. Econ.*, p. 232.)

But a strong desire for a more liberal system of administration had long been growing up in the country; and so powerful did it ultimately become, that it could no longer be thwarted without the imminent risk of revolution, or, at all events, of civil war. Under these circumstances, the late king, Charles Albert, issued, on the 8th February, 1848, an ordinance, establishing a representative system of government, from which we extract the following paragraphs, viz.:—

"Art. 1. The Catholic, apostolic, and Roman religion, is the sole religion of the state.

U 11

" The other forms of public worship at present existing are tolerated in conformity with the laws.

" Art. 2. The person of the Sovereign is sacred and inviolable. His Ministers are responsible.

" Art. 3. To the King alone appertains the executive power. He is the supreme head of the state. He commands all the forces, both naval and military; declares war, concludes treaties of peace, alliance, and commerce; nominates to all offices, and gives all the necessary orders for the execution of the laws without suspending or dispensing with the observance thereof.

" Art. 4. The King alone sanctions and promulgates the laws.

" Art. 5. All justice emanates from the King, and is administered in his name. He may grant mercy and commute punishment.

" Art. 6. The legislative power will be collectively exercised by the King and by two Chambers.

" Art. 7. The first of these Chambers will be composed of members nominated by the King for life; the second will be elective, on the basis of the census to be determined.

" Art. 8. The proposal of laws will appertain to the King and to each of the Chambers, but with the distinct understanding that all laws imposing taxes must originate in the elective Chamber.

" Art. 9. The King convokes the two Chambers annually, prorogues their sessions, and may dissolve the elective one; but in this case he will convoke a new assembly at the expiration of four months.

" Art. 10. No tax may be imposed or levied if not assented to by the Chambers and sanctioned by the King.

" Art. 11. The press will be free, but subject to repressive laws.

" Art. 12. Individual liberty will be guaranteed.

" Art. 13. The judges, with the exception of those of *mandamento*, will be irremovable, after having exercised their functions for a certain space of time, to be hereafter determined.

" Art. 14. We reserve to ourselves the power of establishing a district militia (*una militia comunale*), composed of persons who may pay a rate which will be fixed upon hereafter. This militia will be placed under the command of the administrative authority and in dependence on the Minister of the Interior.

" The King will have the power of suspending or dissolving it in places where he may deem it opportune so to do.

" The fundamental statute which is about to be prepared by our command, in conformity with these bases, will be put in force when the new organisation of the communal administrations shall have been carried into effect.

" Whilst we thus provide for the highest emergencies of political order, we are unwilling to defer any longer the accomplishment of a desire which we have cherished for some time—namely, that of reducing the price of salt to 30 centimes per kilog. from the 1st of July next ensuing, principally for the benefit of the poorer classes of society, persuaded, as we are, that we shall find amongst the wealthier that compensation for the public treasury which the necessities of the state require."

This liberal system of government has since been fully established; and, notwithstanding the critical circumstances under which the country has been placed by the prevalence of revolutionary doctrines in Italy, the unsuccessful termination of the contest with Austria, and the abdication and death of its author, the new system has succeeded extremely well; indeed, the proceedings of the Sardinian chambers contrast most favourably with those of the greater number of the continental representative assemblies.

In each prov. the whole power of government is entrusted to an intendant, who, like other functionaries, is appointed by the king; who, of course, may, also, dismiss him at pleasure. Intendants of an inferior grade are appointed for districts and towns, who manage all the public business of their respective localities, though every town has also a magistracy, varying in its number of members according to circumstances, which regulates its municipal and private affairs. In each district is a judge, with authority in civil causes, to the amount of 300 lire; but from whose decision appeal may be made, when the amount exceeds 100 lire. Each of the 40 provs., into which the country is now divided, has a tribunal, with a president, from two to six councillors, a government advocate, &c. In 1838, a new code of laws for the Sardinian States was adopted, which, though certainly an improvement on the heterogeneous code it replaced, exhibited some glaring defects. Among others, the use of torture was retained in certain cases; the most arbitrary means were used to extend the Roman Catholic religion; and Jews were subjected to the most illiberal restrictions. But some very important changes have been made in the interim; and, notwithstanding the strenuous opposition of the clergy, all cases, whether of a civil or

criminal nature, in which they are parties, are now tried by the ordinary tribunals of the country. The whole population is Roman Catholic, except about 7,000 Jews, 21,000 Waldenses in the N. W. part of Piedmont, and a few Protestants in Genoa, and elsewhere. Public instruction is less diffused than in Austrian Italy, and is in general of a very inferior kind. The principal university at Turin has four faculties, and about 1,300 students. Genoa, also, has a university, and there are secondary universities at Chambery, Asti, Mondovi, Nice, Novara, Saluzzo, and Vercelli, with 27 royal colleges in the larger, and 54 communal colleges in the smaller towns. The professors may be either clergymen or laymen, but where the candidates are otherwise equal, clergymen are usually preferred. It is due to the old Sardinian government to state that it discovered of late years a very enlightened spirit, and did much for the improvement of its subjects. Schools and colleges, as well as most branches of the public service, were materially ameliorated. Various new and wholesome laws were enacted for the regulation of communes, roads, weights and measures, sanitary police, vaccination, prisons, forests, the game laws, &c. A good many roads, canals, and bridges, were constructed, and hospitals, museums, baths, and public establishments of all kinds, were founded; the harbours were improved; light-houses and barracks built, and the army was re-organised.

The Piedmontese infantry is composed of two classes of soldiers, viz., the permanent and the contingent (*Provinciali*). The former serve 8 years in the standing army, and at the end of that term receive their discharge from all future service. The latter serve nominally 16 years, during 8 of which they are considered as forming part of the standing army, and the remainder they belong to the reserve. They are consequently divided into 16 annual contingents, 8 for the first period, and 8 for the second. Each soldier has to perform active services for 14 months after his enrolment, on completing which he may return home, but is subject to be called upon during the remainder of the first term of 8 years to re-enter temporarily the ranks, for the annual formation of a camp of manoeuvres, or upon any occasion of state emergency. The Sardinian army on the peace establishment consists of about 38,000 men; but in time of war it may be raised to 147,500 men, of whom 112,000 are infantry, 11,000 cavalry, 10,500 artillery, and the remainder guards, veterans, &c. Perhaps no country in Europe has a better organised army, or a finer soldiery, in proportion to its extent. The subaltern and field officers are, in general, a fine body of young men, well educated in the duties of their rank. But the general officers are not supposed to possess the experience adequate to the proper exercise of their commands, inasmuch as they mostly owe their rank to court intrigue and royal favour, and not to the value or length of their services. In this respect, however, Sardinia is not singular. Napoleon and Frederick the Great selected their officers, because they were aware of their merit, and cared for nothing else. But ordinary sovereigns can do nothing of the sort; and court favour and parliamentary influence, without regard to merit, must, speaking generally, be at all times omnipotent in the disposal of places in the army, as in everything else.

According to the statement of the finance minister, Signor Nigra, the revenue, in 1850, was estimated at 90,978,466 lire, and the expenses at 110,400,000 lire. But this was an exceptional year, the expenditure being increased by including in it a portion of the expenses of the late war. The debt amounts to 280,000,000 lire, including 74,000,000 borrowed on account of railways, and 75,000,000 of indemnity to be paid to Austria. The only exemptions from the land-tax are in favour of the royal palaces, domains, and manufactories; the residences and gardens of the clergy, churches, and churchyards.

Savoy was the nucleus of this monarchy. It was governed, as early as the tenth century, by its own counts, whose descendants acquired Nice in 1389, and Piedmont in 1418. The sovereigns of Savoy and Piedmont were long celebrated for their ability and the skill with which they preserved and extended their limited dominions, notwithstanding the difficulty of their position in the immediate vicinity of the great European powers.

This territory was recognised as a separate kingdom at the peace of Utrecht, in 1713. Sicily was then added to the Piedmontese dominion; but, in 1738, it was exchanged for the island of Sardinia. Genoa and its territory, Monaco, &c., were annexed to the Sardinian crown at the peace of 1815. In 1848, the king, Charles Albert, put, or rather was compelled to put, himself at the head of the movement in Italy for the expulsion of the Austrians. At first his efforts met with some success; but having been defeated in the decisive battle of Novara, he abdicated in favour of his son Victor Emmanuel. The latter immediately concluded a treaty dictated by the Austrians, who stipulated that they should be paid, as stated above, an indemnity of 75,000,000 lire on account of the expenses of the war. Charles Albert died at Oporto on the 28th July, 1849.

SAREPTA.

SAREPTA, a town of European Russia, near the frontier of the government of Saratoff, on the Sarpa, near its confluence with the Volga. Pop. above 3,000. This town was founded, in 1765, by a colony of Heralsters in Moravia. It is well built, neat, clean, and fortified, so as to be secure from the predatory incursions of the nomadic Asiatic tribes. Its inhabs. are distinguished by their industry: they manufacture linens: silk and cotton stuffs, with stockings and caps, in great request all over the empire. They also raise and manufacture tobacco, distil spirits, &c.

SARQUEMINES, a town of France, dép. Moselle, cap. arrond., on the Sarre, 41 m. E. by N. Metz. Pop., in 1846, 4,483. This town, under the name of Guemund, was formerly one of the strongest in Lorraine; but no portion remains of its ancient fortifications except a dismantled citadel, now appropriated to the *gendarmérie*. The sub-prefecture, hall of justice, and college, occupy the buildings of a Capuchin convent, founded in 1731. There are some spacious prisons. Sarreguemines has manufactures of cotton thread, forks, spoons, and earthenware of a superior quality; and is the entrepôt for the *papier-mâché* stuff-boxes made in the surrounding villages, and of which it is said to export 100,000 dozen a year. (*Dict. Géog. ; Guide du Voyageur.*)

SARI, a very ancient city of Persia, prov. Masanderan, of which it is the cap., about 18 m. from the S. shore of the Caspian, and 115 m. N. E. Teheran. Previously in 1836 it is said to have had from 30,000 to 40,000 inhabs. who carried on a brisk trade with Astrakhan, and the interior of Persia (see *Fraser's Trav. on the Caspian*, 14.); but about that time it was nearly depopulated

by the plague. "Sari is surrounded by a ditch and a mud all, flanked by pentagonal brick towers. The gateways are fallen down, and roads have been broken through a wall in every direction. The appearance of the town differs essentially from that of any other in Persia of Elburz. The houses are built of burnt brick, and stily tiled; some of the streets are well paved; and, though the marks of ruin are every where visible, Sari something of the appearance of an English village, or a market-town." (*Major d'Arcy Todd, in Geogr. misc.*, viii. 104.) Sari is frequently mentioned by the Ferdowsi. Its vicinity is flat, woody, and well-wooded. (*Kianier's Persian Empire*, 163.)

SARK, or **SERCO**, one of the islands belonging to Britain in the English Channel, lat. $49^{\circ} 20' N.$, $1^{\circ} 34' W.$, intermediate between Guernsey and Jersey, 7 m. E. the former, and 9 m. N.W. the latter; E. and greatest breadth, about 2 m. each. Pop., in 1785. It is divided into two portions, Great and Little Sark, united by a narrow neck of land. It differs from the adjacent islands in its physical features. Soil is sandy, and produces most kinds of grain & vegetables. A good many fish and sea-fowl are taken on its coasts. The inhabs. make cheeses, and knit caps, gloves, Guernsey jackets, &c.; which they send ports in the W. of England, in exchange for coal and manufactured goods.

NO, a town of the Neapolitan dom., prov. Principato, cap. cant., at the head of the river Sarno (an.), 11½ m. N.W. Salerno. Pop. estimated at 12,000. Well built and flourishing town, having a cathedral, several convents, an old castle, belonging to the Barberini family, a seminary, hospital, some public baths, and manufactures of paper and copper

is celebrated in history for the desperate battle in its vicinity, anno 552, between the troops of the emperor Justinian, and the Goths under their king Totila. The entire defeat of the latter, and the death of the emperor, terminated the Gothic kingdom in Italy. (*Olden, vii. 301.; Crocker's Tour in the It.*, ii. 185—186.)

LE, a dép. of France, reg. N.W., between lat. $48^{\circ} 40' N.$, and long. $0^{\circ} 25' W.$ and $0^{\circ} 50' E.$; Orne, E. Eure-et-Loir and Loir-et-Cher, S. Orléans and Maine-et-Loire, and W. Mayenne. Compact shape, 60 m. in length, N. and S., by same in breadth, E. and W. Area, 621,600 sq. m. , in 1846, 474,376. Surface generally level, except N.W., where there are a few hills. The rivers are the Sarthe, with its tributaries the Mayenne, and Loir. The Sarthe rises near Mortagne, dép. Orne, and runs with a very tortuous and S.W., to the vicinity of Angers; near Angers the Loir, and unites with the Mayenne. In the 16th century it was navigable to Le Mans, but is now difficult for some distance below that city. Le Mans, Alençon stands on the Sarthe. The dép. is very various; in some parts fertile, but poor sandy tracts predominate, especially E. In 1834, the arable lands were 353,466 hectares, meadows 56,120 ditto, 681 ditto, orchards 19,479 ditto, and woods 1,000 ditto. Wheat, barley, and rye are the principal

SASSARI.

611

corn crops; and are sufficient, along with potatoes, to which at least 1,200,000 bushels were raised in 1846.

used merely as a barrack. It has a good main street; and is surrounded by public walks, shaded by trees. Sassari has numerous churches, convents, and nunneries, a Tridentine seminary, and a public hospital. The cathedral, a massive structure, has a disproportionately large, and very elaborate façade; but its interior is clean and airy, and it has several good sculptures, including a monument by Canova. The university is established in the former Jesuit's college. The palace of the governor is an extensive edifice, and the public buildings in general are well adapted for their intended purposes. There are some pretty good inns and coffee-houses, and the shops are fully equal, if not in some instances superior, to those of Cagliari. (*Smyth's Sardinia*, pp. 267, 268.) It is the seat of an archbishop, of a tribunal of secondary jurisdiction, with appeal to the *Audienza Reale* of the island, and of a tribunal of commerce; and is the residence of the vice-intendant and vice-treasurer of Sardinia, and of a military governor. It has a considerable trade in tobacco, oil, fruits, &c.

Porto Torres (an. *Turris*), its port, 10 m. distant, can only accommodate small vessels; ships of large size being obliged to anchor in the roads nearly one mile outside, where, however, the anchorage is pretty good. Sassari rose on the decay of Turris, during the insecurity of the middle ages. Agriculture appears to be better conducted in its vicinity than in any other part of the island. Immediately without its walls is the fountain of Rosello, an abundant source of water, embellished with much architectural ornament. (*Smyth's Present State of Sardinia; Official Reports, &c.*)

SASSBACH or Salzbach, a village of the Grand Duchy of Baden, bailiwick of Achern, at the foot of the mountains of the Black Forest, on an affluent of the Acher, 17 m. E.N.E. Strasburg. This village, which has about 1,000 inhabs., has acquired a high degree of historical interest from the famous Marshal Turenne having been killed in its vicinity, by a random shot, on the 27th of July, 1675. The circumstances attending the death of this great general have been detailed by Voltaire (*Siècle de Louis XIV.*, cap. 12.), and other distinguished writers. His remains, deposited by order of Louis XIV. in the royal burying-place in the abbey of St. Denis, escaped, at the era of the Revolution, the fanatical violence that scattered the dust of so many kings. At length, after various vicissitudes, they were deposited in the church of the Invalids, by order of the still more illustrious captain now entombed within the same sacred precincts. A monument, in honour of Turenne, erected in 1781 on the place where he fell, was repaired in 1801 by Moreau, and was reconstructed of granite in 1829. The funeral orations in honour of Turenne, by Flechier and Mascarón, are *chefs-d'œuvre*.

SATALIEH, or ADALIA. See ADALIA.

SATTARAH, a considerable town and fortress of Hindostan, prov. Bejapoor, about 60 m. S.S.E. Poonah. Lat. $17^{\circ} 42' N.$; long. $74^{\circ} 12' E.$ The fort stands on a scarped hill; at the foot of which is the town, built partly of stone, and partly of mud or unburnt bricks, but comprising no edifice of note, if we except a new palace built within the last 20 years. The fort, though naturally strong, was taken by Sevajee from the Bejapoor sovereign in 1673, by Aurungzebe in 1690, and by the British in 1818. The British cantonments are about 2 m. to the E. Sattarah was, under Sevajee and his immediate successors, the cap. of the Mahratta Empire. The Sattarah rajahs, however, had been reduced to the condition of *rois fainçants* by their ministers, the Peishwas, for a lengthened period previously to 1818, when the British vested the rajah with a limited authority over a portion of the dominions of his ancestors. The Sattarah territories since then have comprised an area of about 8,000 sq. m., with a pop. of, perhaps, 1½ millions. In his evidence before the committee of the H. of C., in 1830, Colonel Briggs stated, "The administration of the government of Sattarah may be deemed a good specimen of the management of a native government. The country is divided into districts, each yielding from a lac to 1½ lac of rupees, containing from 150 to 200, and even 300, villages. Over this district is an officer, called a soubahdar. That district is then subdivided among a great number of junior officers, each having from 6 or 8 to 20 villages under his charge. The whole civil and judicial business is conducted through those officers. The annual assessment of the land is fixed with reference to the sum yielded in former years; the assessment varying every year with the quantity of land cultivated. The revenue is always paid in money." In 1828, it amounted to about 15,60,000 rupees. This state was subsidiary to the British till about 1839, when the rajah, having been detected in a conspiracy against the British authorities, was dethroned, his dominions having since that time been amalgamated with and administered under the Bombay Presidency. (*Hamilton's Gazetteer; Parl. Reports.*)

SAVANNAH, a city and port of entry of the U. States, state Georgia, on the river of its own name, about 12 m. from its mouth, and 80 m. S.W. Charlestown; lat. $32^{\circ} 2'$

N., long. $81^{\circ} 3' W.$ Pop., in 1840, 11,214. It stands on a bluff sandy point, rising about 40 ft. above the river, from which it has an imposing appearance; its spacious and regular streets, and handsome public buildings, being interspersed with many trees, &c. Previously to 1830, when it suffered from a terrible fire, it was mostly built of wood, and it was formerly also insalubrious from the contiguity of rice swamps. This evil has, however, been effectually obviated; and being now principally of neat stone houses, it is one of the handsomest towns in the S. states. It has numerous churches, an exchange, academies, &c. It is one of the principal ports in the U. States for the export of cotton, the shipments from it, in 1849, being 405,466 bales, whereof 217,665 were for foreign parts. It also exports considerable quantities of rice. Almost the entire foreign trade of the state, the exports from which amounted, in 1849, to 6,857,806 doll., is carried on from Savannah. The imports are trifling, being only, in the same year, 371,024 doll. There beloned to the port, in June, 1849, 19,222 tons shipping. (*American Official Returns, &c.*)

SAVE (Germ. *Sau*, an. *Savus*), a river of the Austrian empire, and one of the principal tributaries of the Danube. It rises towards the N. extremity of Carniola, in about lat. $46^{\circ} 30' N.$, long. $14^{\circ} E.$, and runs at first S.E. through the government of Laybach and Croatia, to about lat. $45^{\circ} 15'$, long. 17° . It thence has more of an E. direction, forming the boundary line between the Austrian prov. of Slavonia on the N., and Turkish Croatia, Bosnia, and Servia on the S., till it enters the Danube at Belgrade, after a course of about 590 m. (*Berghaus.*) Its chief affluents are the Kulpa, Unna, Verbas, Bosna, and Drina. Though not very rapid, its inundations are often very destructive. Being navigable as far as the mouth of the Kulpa, for vessels of from 150 to 200 tons, it is a good deal used for commercial purposes. Few towns of any consequence are, however, situated on its banks, the principal being Brod and Krainburg; Laybach, Agram, Petrinia, and Posega are, however, at no great distance, and some of them are seated on its tributaries.

SAVERNE (an. *Taberna*), a town of France, dép. Bas-Rhin, cap. arrond., on the Zorn, a tributary of the Rhine, 19 m. N.W. Strasburg. Pop. in 1846, inc. com. 5,371. Though finely situated, it is but indifferently built, and has no remarkable edifice, except an old palace, formerly belonging to the bishops of Strasbourg, but now used for the police barracks and prison. The town has manufactures of woollen cloths, hosiery, hardware, &c., with some trade in timber floated down from the Vosges by the Zorn.

SAUGUR, or SAUGOR, a large town of Hindostan, prov. Malwa, in the ceded districts on the Nerbuddah, lat. $23^{\circ} 48' N.$, and long. $78^{\circ} 47' E.$: taken by the British in 1818. Saugor is also the name of an island of the Sunderbunds, at the mouth of the Hooghly, about 60 m. S.S.W. Calcutta. A railway to connect it with that city was projected a few years ago, and is now probably completed.

SAUMUR, a town of France, dép. Maine-et-Loire, cap. arrond., on the Loire, 28 m. S.E. Angers. Pop. in 1846, inc. com., 11,057. The Loire here forms several islands, and is crossed by five or six bridges, one of which, a stone bridge of 12 arches, 284 yds. in length, long considered as one of the finest in France, connects the town with its suburb of La Croix Verte. Saumur is built partly at the foot, and partly on the declivity, of a hill crowned by a citadel. Its lower portion is tolerably well laid out, and has a handsome quay and terrace facing the river; but the upper town is irregular, and the streets inconveniently steep. The castle, which appears to have been constructed at different periods between the 11th and 13th centuries, was the occasional residence of the kings of Sicily and the dukes of the house of Valois: for some time previously to the Revolution it was a state prison; it now serves as an arsenal. There are several churches worth notice; one of which, curious from its antiquity, is supposed to have been constructed in the 5th or 6th century; and another, *Notre Dame des Ardilliers*, is remarkable for its beauty; having a fine dome supported on Corinthian columns, an altar-piece by Philip de Champagne, &c. The barracks are among the best of that description of edifices in France; they are four stories in height, and can accommodate 1,200 men. The town-hall, public library, public baths, and theatre, are the other principal buildings. Not far from the town is a famous riding-school. It has manufactures of linen cloths, handkerchiefs, necklaces, copper and iron wares, leather, saltpetre, &c.; with a brisk trade in provisions, and 4 large annual fairs. Inglis says he should "greatly prefer Saumur as a residence to Angers; it is more airy and lively, the country quite as beautiful, and provisions are a shade cheaper." (*Switzerland, &c.*, p. 347.)

Saumur was taken in 1026 by Fulk of Anjou, and, after many vicissitudes, was annexed to the French crown in 1570. A Protestant academy, founded here by the famous

Dupleix Mornay, the friend of Henry IV., governor of the town for a lengthened period, was dissolved by Louis XIV. in 1684. (*Hugo, art. Maine-et-Loire; Guide du Voyageur; Dict. Géog.*)

SAVONA, a town and sea-port of N. Italy, in the Sardinian States, div. Genoa, cap. prov. on the Mediterranean, 20 m. S. W. Genoa. Pop. (1838), with comm., 16,311. It has ramparts, which, however, are of no great strength, and many good public and private buildings; but its streets are narrow, winding, and badly paved. It had formerly two harbours, the best of which was filled by the Genoese in 1525, from jealousy of its capabilities: the other, formed by a mole projecting E. into the sea, is small, and is rather difficult of approach, from the accumulation of sand and mud near its mouth. Savona is a bishop's see, and the seat of judicial and commercial tribunals; it has manufactures of silk goods, iron and earthenware, and exports oranges and lemons, grown in its vicinity. Savona was the birthplace of Popes Sixtus IV. and Julius II., and is said to have been for some time the residence of Columbus. Pope Pius VII. was also detained in it in 1810-11, by order of Napoleon. (*Dict. Géog., &c.*)

SAVOY. See SARDINIA (kingdom of).

SAXONY (KINGDOM OF), a secondary state of Central Europe, and of Eastern Germany, principally between lat. 50° 10' and 51° 30' N., and the 12th and 15th degs. of E. long.; having W. the indep. Saxon principalities; N. Prussian Saxony and Brandenburg, and S. Bohemia. It is of a triangular shape. Length, E. to W., about 140 m.; greatest breadth nearly 90 m. The area, pop., subdivisions, &c., are as follow:—

Circles.	Area in sq. m.	Pop. 1846.	Pop. to sq. m.
Dresden	1,670	461,107	277.9
Leipzig	1,338	417,711	311.6
Zwickau	1,786	669,114	374.6
Budissin	965	246,171	256.5
Total	5,759	1,856,433	318.8

The pop., as given above, comprises 43,886 Wends or Vandals.

The *Erzgebirge* (ore mountains), and the *Riesengebirge* (giant mountains), extend along almost the whole of the S. and S.E. frontier, but they nowhere rise to 1000 ft. of elevation. Their declivity is more gradual and undulating on the Saxon than on the Bohemian side; so that they cover the greater part of the country with their ramifications, rendering it either mountainous or hilly. There is, however, a very considerable extent of level ground, extending from the foot of the hilly tract, or from Collitz, Meissen, and Bautzen, northward, all along the frontier of Prussian Saxony. The entry to the S.E. of Dresden, where the Elbe forces its way through the mountain chain, has been called the "Saxon Switzerland." It is about 30 m. in length by 10 m. in breadth, diversified, and highly picturesque; but the name is likely to convey a wrong impression of its scenery, its highest summit, the Schneeberg, being only 2,150 ft. in height. The spurs given off by the *Erzgebirge* to the N. enclose the valleys of the Elbe, the Muldas, the Zochoppau, Elster, Pleisse, &c., all of which flow to N.W., and, except the first, which is navigable throughout the whole extent of the kingdom, are in Saxony.

Saxony has a milder climate than most parts of continental Europe in the same lat.; the mean temp. of the winter being about 47° Fah.; that of the winter quarter being 35°, the summer 59°, at an average of the entire country. The land has a mean elevation of about 1,100 ft. above the sea. The landed properties are rather of limited size; but in rural districts the people appear to be contented, and the whole, comfortable: pauperism is rare. According to Mr. Gleig, "There is, perhaps, no country in the world where more is made of the land than in Saxony."

Every spot of earth which seems capable of return is cultivated; and the meadows are twice or thrice in the course of each summer. The people meet with such a thing as a common or waste of the forests are all guarded with a strictness quite new to their value. As farmers, I should say Saxons were more clean and industrious than the English. The fields are always well cleared of weeds, and their crops they have a succession: but the favourite is rye; and either because it does not require much manure, or that manure is a scarce article, they do not seem disposed to fatten the soil with it. (*Germany, &c., i. 237-38.*) Rye, wheat, and barley are scarcely grown, except in the low country. In the mountain region they are met with only in oats and potatoes being there the chief crops. Flax, millet, teasel, flax, oil seeds, tobacco, and fruit, are pretty generally cultivated; and

from this extract, that Mr. Gleig knows nothing of the appearance of the country, or of some value.

artificial grasses are nearly universal. But, notwithstanding the improvement of agriculture, and the industry of the people, considerable quantities of corn have to be imported. A great deal of fruit is grown; and between 7,000 and 8,000 morgen of land are occupied with vineyards. In 1835, upwards of 53,000 cimers of wine were made, some of very tolerable quality. The forests, which occupy about 1-4th part of the entire surface, consist of fir, pine, beech, oak, elm, maple, larch, &c. Upwards of 1-3d part of the woods belongs to the crown, yielding an annual revenue of 2,000,000 dollars; and nearly 10,000 individuals are engaged in wood-cutting.

Saxony is celebrated for her breeds of sheep, which are among the finest in Europe. The late king, when elector of Saxony, introduced the breed of Merino sheep into his dom., and exerted himself to promote the growth of this valuable race of animals with such success, that they are now found to succeed better in central Europe than in Spain; and, notwithstanding the rapidly increasing importations from Australia, the greater portion of the immense quantity of wool that we import still continues to be brought from Saxony and other German states. According to Berghaus, there are only 626,000 sheep in the kingdom; but we apprehend that there must be some signal error in this statement, and that their number must be very materially greater. Indeed, they are stated, in *Horschelman's Stern* (ii. 475.), to exceed 2,000,000. We may farther state that, in 1837, Prussian Saxony had above 2,000,000 sheep; and though it be more extensive than the kingdom of Saxony, we believe it is not so well stocked as the latter. The best wool is produced on the sheep-walks of the Saxon Switzerland. The cattle of Saxony, the number of which exceeds 550,000, are also of a superior description; but the butter is usually indifferent, while, to increase its weight, it is frequently overloaded with salt. But, such as it is, the demand for it is universal. "Never," says Mr. Strang, "did I witness so much butter daily consumed, as I have seen since I entered this kingdom. Here, in short, bread and butter is the order of the day at all hours. It is the perpetual family staple, and essential as a make-weight at every meal. You find it with equal propriety at breakfast, at lunch, at dinner, and at supper. A larder in Saxony may well be called the *buttery*!" (*Germany, &c., i. 140.*) Horses are not so extensively reared as other live stock, and hogs are not numerous. The game laws are very rigidly enforced, all sorts of birds being included in their enactments; and rights of fishing, &c., appear to be preserved with the most scrupulous tenacity.

Mining is one of the principal occupations of the inhabitants. Few parts of Europe equal the *Erzgebirge* in the variety and extent of their mineral riches. The basis of these mountains is granite, covered by gneiss, mica, and clay slate in succession, between which are other strata containing metallic ores. Upwards of 500 mines are wrought, which are said to employ about 11,000 workmen; and between 50,000 and 60,000 persons, or about 1-30th part of the entire pop., derive their subsistence from mining industry and the manufacture of metallic products. The total annual value of the metals obtained is estimated, by Berghaus, at 1,760,000 dollars; the silver producing nearly 930,000, and the iron and iron-ware 400,000 dollars. Lead, bismuth, arsenic, antimony, cobalt, and manganese are the other principal metals. Freiberg (which see, i. 868.) is the centre of the silver mining district. The neighbourhood of Meissen yields the fine porcelain clay, of which the "Dresden China" is made. About 1½ million *schefel* coal are annually produced. Salt is scarce, since the salt mines, formerly included in the Saxon kingdom, were separated from them in 1815, and this important necessary is mostly imported from Prussia. Serpentine marble, and fine building stone, are abundant; as are various gems, including the topaz, jasper, agate, tourmaline, &c.

The most important branch of manufacturing industry in Saxony is that of cotton. Its extension has been attributed to the nearly contemporaneous introduction of the potato, called by German writers the "manna of the mountains," and which has enabled the Saxon weavers to obtain a sufficiency of food at exceedingly low wages. In 1830, there were in Saxony 86 spinning establishments, having 361,202 spindles, employing 5,380 adults, and 2,443 children: of these establishments, only 3 were wrought by steam. In 1837, there were 124 spinning establishments, with 490,325 spindles. (*Bowring's Rep. on the Prussian Commercial League, p. 35.*)

Most descriptions of cotton fabrics are now produced, and many new factories have been established in Chemnitz, Zwickau, Aueran, Freyburg, &c. Great efforts are making to improve the construction of machinery; and joint-stock companies for the purpose have been established near Chemnitz and Dresden. Coal has within these few years been found in the neighbourhood of Dresden; and it is said that the mines are becoming productive, and promise a good supply. Cotton-printing works are on the increase, and have been much improved

within the last few years. Although the Saxon prints, in general, are not equal to the best English in beauty of pattern or brightness and fastness of colouring, they are said to make up for these deficiencies by the cheaper rates at which they can be produced. (*Keyser, in the Handloom Weavers' Report*, part II. 510, 511.) The only article, however, in which the Saxons come into competition with us in the American and other foreign markets is cotton hosiery, particularly the inferior descriptions. Dr. Bowring says that he had seen some stockings intended for the American markets which were sold at the rate of 3s. 4d. a dozen! The number of stocking-frames amounted, in 1815, to about 9,000; in 1831, to 14,000; and in 1836, to 20,000. The number of master-workmen, in 1831, was 7,165; hired workmen, 3,444; apprentices, 2,852; in all, 13,461 persons. The number of frames in work was 13,841, and the average weekly return per frame was 1 doll. 4 gr., = 3s. 4d. sterling. There is no branch of industry which seems more appropriate to Saxony than this. It requires only a small outlay of capital for the stocking-maker; his wooden frame is not expensive; the cost of his stock of cotton twist is small; and by associating agricultural with manufacturing industry, he supplies himself from his own little farm with the principal necessaries. If we may depend on the statements of Bowring and others, it would appear that the stocking-weavers of Saxony are in a state of progressively increasing prosperity. Most of them are independent labourers, buying for themselves the raw material and selling their manufactured stockings to a number of small collectors, who furnish the Chemnitz or the Leipzig markets. (*Bowring's Report*, p. 36.)

We confess, however, that we are not a little sceptical as to several of these statements, and have very great doubts whether persons in the condition of the Saxon stocking-weavers can ever come into competition with those of England in the production of any but the coarsest description of goods. In illustration of what is now stated, we may mention, that during the year ended the 30th of September, 1839, hosiery of the value of 412,410 dollars was imported from the Hanse Towns into the United States, of which, probably, the principal portion was from Saxony; and this, with yarn of the value of 22,310 dolls., made up the whole of the imports of cotton goods into the United States from these ports in the course of that year! (*Official Report by Congress*.)

The manufacture of linen in Saxony is also of considerable importance. The weaving business employed, in 1839, from 12,000 to 13,000 looms; of which about 950, employing about 3,000 persons as weavers, loom-builders, pattern-drawers, &c., were appropriated to the weaving of damasks and table-linen. The weekly earnings of the damask weavers vary from about 2s. 3d. up to 7s. 6d.; but for white linens the utmost amount of a man's wages, per week, would be from 2s. to 2s. 4d. sterling. The spinning of flax employs numerous hands; but notwithstanding about 10,000 cwt. of yarn is annually imported from Silesia, Bohemia, &c., and latterly there have been considerable importations from England. (*Handloom Rep.*, p. 511.)

In 1837 there were in Saxony 126 establishments for spinning woollen yarn, with 71,066 spindles, and 18 establishments for combed yarn, with 30,765 spindles; making together 101,851 spindles, being an increase of 31.1 per cent. since 1834, and of 127 per cent. since 1831. The progress of the Saxon cloth manufactures in the three years from 1834 to 1837 is stated, in an official report, to have been greater than in the 30 years preceding! Great improvements have been introduced, not only in the fabric, but in the finish of woollen goods, particularly by the introduction from the Netherlands of a new steam brushing machine. In 1839 the woollen manufacture employed from 3,000 to 4,000 looms, which produced about 160,000 pieces of cloth. Much attention has been paid of late to the manufacture of machinery; though it be still far behind what is met with in the manufacturing districts of Great Britain. The Jacquard loom is gradually being introduced, and there are schools of manufactures at Dresden, Chemnitz, Plauen, &c. Plain and figured silks, of very fair quality, are made at Annaberg, Penig, and Frankeuberg. The government is very desirous of promoting the culture of silk, and some establishments for the propagation of the worms exist at Dresden and Leipzig; but in such a climate they can hardly be expected to have much success. Wooden wares are made in the country, of the estimated value of about 200,000 dollars a year (*Berghaus*); and Saxony supplies furniture of every description, musical instruments, &c., to a great part of Germany. Porcelain, and modern antiques, are articles made in large quantities, particularly at Meissen. The china produced here formerly enjoyed a very high reputation throughout Europe, but, owing to the extraordinary improvements made in the manufacture in this and other countries, Meissen china has declined considerably from its ancient celebrity. Almost every article of use or luxury is made

in Saxony; the chief deficiency is in paper, of which the Saxon manufactures do not produce nearly enough for the immense consumption of the presses of Leipzig and Dresden.

The extension of the cotton and woollen manufactures of Saxony, since 1833, is wholly, or almost wholly, ascribable to the circumstance of her having then joined the Prussian Commercial League. This opened a widely extended market for her products among the German States, from the greater number of which they had previously been either wholly excluded, or admitted only clandestinely, and under great difficulties. Saxony, in fact, has derived the greatest advantage from the League, much more, in proportion to her extent and population, than Prussia. Little or no cloth of Saxon manufacture has hitherto found its way to the United States.

The extensive commercial relations of Saxony owe their origin to the enlightened policy of Frederick Augustus, the Elector, afterwards, King of Saxony, who, at a time when protecting and prohibitory tariffs surrounded his states, adopted a liberal commercial system, and converted Saxony, and especially Leipzig, into one of the most important marts, not merely for the supply of central and northern Europe, but part even of Asia, with all sorts of manufactured produce. The fairs at Leipzig were for a lengthened period the great sources whence Russia, as far as the borders of China, Poland, the provinces on the Danube, and many parts of the Turkish and Persian dominions, were supplied with manufactures; and though they have latterly declined, they still continue to be much resorted to. Leipzig has been for a lengthened period the centre of the book trade of Germany, being, London and Paris only excepted, the greatest literary emporium in the world. The value of the works sold at the Easter fair of late years has been estimated at about 3,000,000 dollars; and as many as 600 booksellers are said to have been assembled at some of these fairs from all parts of Germany to dispose of their publications and adjust their accounts! (*See Leipzig*.)

The Convention dollar, coined in Saxony, = 32 gütengroschen, or 4s. 1½d. Engl.; the Saxon dollar of 24 gr. is an imaginary coin. 100 Dresden *schellings* are equivalent to 196 of Berlin. The other measures, &c., are comparatively unimportant, and the coins of Prussia are generally current.

Government.—Saxony is an hereditary and limited monarchy, having a senate or upper house, and a house of representatives. Previously to 1830, it had states: but these had comparatively little power; and the imposition of taxes and other public burdens, and the regulation of the public expenditure, mostly depended on the pleasure of the king. But the French Revolution of 1830 was speedily followed, in Saxony, by some very important political changes. The king was obliged to associate his nephew, the present sovereign, with him in the government, a representative system was organised on a new principle, and the abuses incident to the feudal system were suppressed.

The senate consists of 52 mems., and the house of representatives of 300. Of the senators, some take their seats by virtue of their offices, as the Rom. Cath. bishop, the king's principal chaplain, a Protestant bishop, the dean of the university, and one or two great officers of state. Of the remainder, some sit in the right of their estates, and transmit their privileges, as senators, with their estates, to their children; while others are elected for each parliament by a constituency of their own order. The qualification for a seat in the senate is the same that is required to entitle a man to vote in the election of a senator, viz. a landed estate worth 6,000 dollars a year. The lower house is elected by a species of household suffrage, or by such heads of families as contribute in any way to the public burdens. The candidate must possess property to the amount of 1,000 dollars a year. Senators receive 7 dollars a day during the sitting of parliament, and deputies 3 dollars. But owing to the high qualification required for deputies, and other causes, the new constitution is not so popular as might have been expected. "Though," says Mr. Gleig, all "money-bills must needs, as among ourselves, originate in the Ch. of Dep., the minister has but to propose his plan through an agent, and he is sure to carry it. Meanwhile the constituency, especially in the rural districts, complain loudly that their parliament is worse than useless; that it saddles them with burdens which, under the old system, they were not required to bear; that now they have 350 sovereigns to maintain instead of one! The rigid censorship still exercised over the press keeps the Saxon public profoundly ignorant of what is passing in their parliament; though as to speaking, such a thing is unknown in the Ch. of Dep. In the upper house the case is somewhat different; for it is composed of men who do occasionally speak." (*Gleig's Germany in 1837*, i. 182—194.)

But with all its defects the newly organised representative system is of great importance to the kingdom; and it will, no doubt, acquire greater influence and inde-

police making a difference makes the difference
 law-abiding citizens with their rights and duties.

Further, however, the thread made on the treadle system, which was maintained in the rural districts mainly in the light class, was the most advantageous of the various classes offered in 1890.

Hereditary jurisdiction were abolished, except in very rare cases, and the more oppressive privileges enjoyed by the lords were, at the same time, suppressed. All towns are about their own municipalities, and are governed by laws of their own making, while the rural districts, being divided into departments, each of which has its own magistrature, where the people not only elect, but pay, due to cases of malversation, demands from office. The municipal officers, also, though elected by the citizens for life, are liable, on conviction of incapacity or undue dealing, to be degraded. Their powers are very considerable in reference both to persons and property, for they regulate the police, hear and determine civil causes, and both fix the amount of local taxes to be levied on the citizens, and determine how the produce shall be expended. In the election of the magistrates, every rate-payer has a voice. They are all salaried officers. It is necessary, however, to enable any one to be appointed to the magistrature office, that he should have received a legal education, and be possessed of some small portion of land, and of the house in which he resides.

There are civil and criminal courts in the cap. of each circle, and a high court of appeal in Dresden, in which have all capital cases are tried. Executions take place by decapitation. There are special military tribunals, a superior fiscal court, university court at Leipzig, mining tribunal at Freiberg, patrimonial tribunals, &c. The reigning family is Roman Catholic, but there are not more than 20,000 Rom Catholics in the kingdom, the great bulk of the pop. being Lutherans. Literature and the fine arts have flourished more in Saxony than in any other part of Germany; and there is scarcely any country in Europe where primary instruction is so widely diffused, the number of the individuals attending schools, and other seminaries, is said to be as high as one in six of the population. The university of Leipzig is the principal seminary.

Every male inhab. 50 years of age is, with certain exceptions, obliged to serve in the army for six years in one of peacetime, and for three years subsequently in the reserve corps. The armed force is pretty extensive; it consists of about 12,000 men, of whom 10,000 are privates in the army; besides the reserve corps of 8000 more. It has long held the 4th rank among the Germanies, having four votes in the Ball des and was in competition, and furnishes a contingent of 15,000 men to the army of the Confederation. Its public revenues from 1840 to 1844 have been fixed at 5,500,000 dollars, and its expenditure 4,394,750 dollars. At the end of 1844 the public debt amounted to 10,925,467 dollars.

be Saxons are among the best specimens of the old
 trunk race. In person, manners, &c., travellers have
 noted that they bear a striking resemblance to the
 Irish agricultural pop. The Saxon royal family
 is to be descended from Wiltchind, sovereign of this
 cry in the time of Charlemagne.

only was created an electorate in 1433, which still aimed till 1806, when Napoleon overtook it into a cum. During the late war the king of Saxony was, the battle of Jena downwards, a firm ally of Napoleon who made extensive additions to his dominions; he did not abandon the fortunes of his benefactor or the battle of Leipzig had compelled the French cede Germany. This conduct led to the dismemberment of the kingdom by the treaty of Vienna; some of its most valuable provinces were then sold to Prussia; and, but for the opposition of it, it is probable that Saxony would then have been ruled as a separate state. (Burghaus, *Ally*, p. 40.; Strin, *Strong's Germany and the German's Germany*, &c., passim.)

17, a prov. of the Prussian states, consisting of territories dismembered from the kingdom of 1812, with the Saxon states formerly belonging to, has on the N. E. and E. Brandenburg, S. the of Saxony and the Thuringian states, and on W. Brunswick, and Hanover. It is of a very outline, has several enclaves, and includes a frontiers the independent principalities of Ansbach-Bayreuth, &c. Area, 9,765 sq. m. Pop., 742,452, of whom 1,200,000 are Protestants, and Catholics. It is divided into three regencies, and into 41 circles. Principal towns, Magdeburg, Jena, Merseburg, Naumburg, Berg, &c. The extends to the W. frontier of the prov.; its exception, there are no hills of any consequence. Principal rivers, the Elbe and its the Saale, Mulde, Unstrut, &c. Soil in parts unproductive, but in general heavy and fertile. of Magdeburg is reckoned about the best land

In Prussia, and is very well cultivated. Principal products, wheat and other sorts of corn, flax and hemp, excellent wool, tobacco, &c. The vine is cultivated in the neighbourhood of Merseburg and some other places. Productive mines of coal, iron, rock-salt, &c. are wrought in different parts of the province. The stock of sheep exceeds 2,000,000 head, and wool, which has been vastly improved by crossing with merinoes and other fine-woolled breeds, has become a staple product. Manufactures important and valuable, consisting of fine woollens, linens, earthenware and porcelain, hardware, &c.

SCARBOROUGH, a sea-port, pari. and mun. bor., market-town, and par. of England, N. riding, co. York, and E. div. of the wap. of Pichering Lythe, on a rocky slope, rising from an extensive bay, 18 m. N.E. York. Area of pari. bor. (which includes, with the old town and par., the extra parochial dist. of the castle), 2,160 acres. Pop., in 1881, 4,760, in 1841, 2,524. It has a very striking appearance from the sea, from which it rises amphitheatrically to a considerable height. It is well built; the streets in the upper part of the town are spacious and well paved, and the houses generally have a handsome appearance. It is also extending S.W. towards Paolgrave, and southward along the shore. The principal public buildings are the town-hall, crinoid house, news room, assembly rooms, a neat and well-conducted theatre, a sea-bathing infirmary, 3 bathing establishments, and 3 public libraries. But the handsomest and most classical building belonging to the town is the museum, a rotunda 37½ ft. in diameter, by 60 ft. in height, in the Roman Doric style. It is constructed of the Kelloway limestone, a fine building material, presented from his extensive quarries at Hackness, by Sir J. V. D. Johnstone, Bart. M.P. for the bor.; and though of recent erection, has a valuable collection of specimens illustrative of the geology and natural history of the N. riding. A fine iron bridge of 4 arches, supported on massive stone piers, 70 ft. in height, has been thrown across a ravine to connect the higher town with the sea.

scription-schools, including two on the National and one on the Lancasterian plan. The Amicable Society also clothes and educates between 70 and 80 boys and girls. A seamen's hospital is under the government of the Trinity House, and there are almshouses, and several other benevolent, as well as religious institutions.

The harbour, which is dry at low water, is protected by a handsome stone pier, of modern erection, but unfortunately its labours under a deficiency of water, having only from 4 ft. to 5 ft. at low ebb springs, and from 5 ft. to 9 ft. at low ebb neaps; but from first quarter flood to last quarter ebb, vessels drawing 9 ft. water may enter the harbour with safety. A small foreign, and pretty considerable coasting-trade is carried on. In 1849 there belonged to the port 188 vessels, of the aggregate burden of 31,203 tons. During the same year the gross customs' duties amounted to 2,007/ 1s. 11d., the duties, previously to the privilege of bonding having been conferred on this port, did not often exceed 1,300/ a year. A great deal of fish is brought in here; and the fishery has greatly increased since the railway has afforded a ready access to the populous districts and great manufacturing towns in the W. Riding. Of late years several persons have embarked in the herring fishery, which is becoming an important and profitable source of employment to the fishermen. From 40 to 50 yachts belong at present to Scarborough and Flay, in addition to the numerous small boats used for fishing in-shore, and it is not unusual for 100 or 200 boats to enter the harbour, during the season, at the same tide, with herrings. As an encouragement to the fisheries, the corporation grant the title of fish to which they are entitled, and a society has been formed to raise an honorary fund, to meet the casual losses of nets, lines, and tackle, of such provident fishermen as become subscribing members; and thus insuring to them, at a slight charge, an advantageous protection.

² When the poem, ship-building, which formerly con-

tributed in no slight degree to the prosperity of the town, has greatly declined, and now has almost ceased; nor, from the shallowness of its artificial harbour, is it ever likely to become a very important trading place. It is supported by the resort of strangers to it for the purposes of sea-bathing and amusement; and these are principally of the middle classes, and from the manufacturing districts of Lancashire, Durham, and the W. riding of Yorkshire." (*Parl. Bound. Report.*) Scarborough is, however, frequented not only for the purpose of sea-bathing, but on account of its two mineral springs; which have lately been analysed by Richard Phillips, Esq. F.R.S. We subjoin the result of his analysis of a gallon of water from each spring.

	North Spring.	South Spring.
Azotic gas	6.5 cubic inches	7.5 cubic inches
Chloride of sodium (common salt)	26.64 grains	29.63 grains
Crystallized sulphate of magnesia	142.68 —	125.33 —
Crystallized sulphate of lime	1104.00 —	110.78 —
Bicarbonate of lime	48.26 —	47.80 —
Bicarbonate of protoxide of iron	1.84 —	1.81 —
Total contents	323.42 —	415.35
Specific gravity of the water	1.0035 —	1.0045

Temperature 49° with very little variation.

It is probable that the spas may, from the growing reputation of the town, and their being so conveniently connected with it by the bridge above alluded to, again acquire some portion of that celebrity which they formerly enjoyed. The recent erection of a commodious saloon, in the castellated style, with embattled towers, the architectural beauty of the wells, the massive seawall, forming at once a secure protection to the spas and a delightful promenade, especially at high water, combined with the newly laid out ornamental walks and grounds, have materially increased the natural attractions of Scarborough as a watering-place. These improvements have been effected at an expense of upwards of 8,000*l.*

Scarborough, which received its first charter from Henry II., in 1252, is divided under the Mun. Reform Act into 3 wards, the government being vested in a mayor, 5 aldermen, and 18 councillors. Corp. revenue, in 1847-48, 1,555*l.* Quarter sessions are held under a recorder, and petty sessions are held weekly both for the bor. and North Riding. The bor. has sent 2 mems. to the H. of C. since 23 Edw. I., the right of election down to the Reform Act being in the common council of the bor., a body comprising 44 individuals. The Boundary Act included with the old bor. the extra-parochial precinct of the castle. Registered electors in 1849-50, 739. It is one of the polling-places at elections for the N. riding, and the chief town of a poor-law union comprising 33 pars. Markets on Thursday and Saturday: cattle fairs, Holy Thursday, and Nov. 28.

N. of Scarborough, on a bold craggy eminence commanding a very extensive sea-view, stand the ruins of a castle built in the reign of Stephen, to which Piers de Gaveston, the minion of Edward II., fled for refuge from the vengeance of the exasperated barons. The castle, after sustaining two sieges from the parliamentary troops, was dismantled at the close of the civil wars; and though a portion of it was repaired in 1745, and barracks have been subsequently built in its immediate vicinity, it is principally in ruins. The remains of the keep consist of a square tower nearly 100 ft. in height: the entire surface included within the outer walls comprises nearly 19 acres. A strong gateway still remains, with portions of the circular towers occurring at intervals in the line of the fortifications. It was, in fact, previously to the invention of artillery, one of the principal strongholds in the kingdom. (*Baines's Gaz. of Yorkshire; Granville's Spas; Parl. and Mun. Bound. Reports; and Private Information.*)

SCHAFFHAUSEN, the most N. canton of Switzerland; and, after Zug and Geneva, the smallest in the Confederation. It is between lat. 47° 40' and 47° 50' N., and long. 8° 25' and 8° 55' E., being separated by the Rhine from the cantons of Zurich and Thurgau, while, on all other sides, it is surrounded by the territory of the Gd. Duchy of Baden. Area, 116 sq. m. Pop., in 1850, 35,300. Surface undulating, its loftiest hill, the Raadenberg, in the N., rising only to about 1,200 ft. above the Rhine. The soil is generally calcareous, but fertile; and the climate is among the mildest in Switzerland. It is an agricultural rather than a manufacturing canton; and, according to Picot (*Statist.* 363.), its agriculture has greatly improved within the last half century. Formerly, indeed, the supply of corn was quite insufficient for home consumption; whereas, in good seasons, considerable quantities are now exported. Artificial pastures have also been

materially increased, as well as the number of cattle: fruits are abundant, particularly cherries, from which a good deal of *kirschwasser* is made; and the produce of timber is amply sufficient for the wants of the inhabs. (*Picot.*) There are nearly 5,000 arpents of vineyards, which furnish the principal article of export, wine being sent to St. Gall and Appenzell, the Black Forest, and other neighbouring districts; but of late years the competition of the wines of Baden, &c., and the duties imposed on the Schaffhausen wines in Germany, have crippled the trade.

One of the principal branches of industry in Schaffhausen is the conveyance of goods through the canton, which is greatly facilitated by the navigation of the Rhine. Salt, from Wirtemberg, timber, &c. are conveyed through Schaffhausen to Switzerland; but the circumstance of the Confederation not being comprised within the Prussian Customs Union is injurious to the transit and export trade of the canton; and in consequence a desire to join the German League has long prevailed in Schaffhausen and some other cantons, though not in the majority. (*Bowring's Rep. on Switzerland.*) The manufacturing establishments comprise a few cotton and hardware factories. Accounts are kept in florins, of 60 *kreutzers* = 20*d.* Eng. The foot is the same as that in Zurich; the lb. a little larger.

This canton is divided into 24 districts. The male inhabitants, of full age, and not bankrupts, paupers, or suffering a penal sentence, choose the legislative body. The latter, or grand council, consists of 74 members, 24 of whom form also the petty council, which is intrusted with most part of the executive power. The grand council meets in June every year, and is presided over by a burgomaster, who is changed annually. The pop. is wholly Protestant. Education appears to be well attended to.

Schaffhausen was not included in ancient Helvetia, and its inhabs. resemble their Swabian neighbours rather than the Swiss. It was admitted into the Confed. in 1501.

SCHAFFHAUSEN (originally *Schiffhausen*, or *Ship-houses*), a town of Switzerland, and the cap. of the above canton, on the Rhine, 25 m. W. by N. Constance, and 49 m. E. N.E. Basle. Pop. about 7,500. It is walled, and defended by the *Munoth*, an old citadel supposed to be of Roman origin, but which is now furnished with extensive bomb-proof casemates. Streets ill paved; and the buildings are remarkable for their quaint and antique architecture: many are ornamented in front with stucco, carved or fresco work. The *minster*, founded in 1052, is a massive edifice in the round arched style, with numerous monuments in its cloisters. An ordinary bridge across the Rhine replaces that unique specimen of art consisting of one arch 364 ft. in length, destroyed by the French under Marshal Oudinot in 1709. Schaffhausen has a gymnasium, a college with 9 professors, a high female school, and an excellent library. The latter comprises the books that belonged to the celebrated historian Müller, by far the most illustrious of the natives of Schaffhausen, where he first saw the light, on the 3d of January, 1753. The town is a principal *dépôt* for the goods passing between Switzerland and Germany, and Basle and Zurich; consisting of silk, cotton, and woollen goods, raw cotton, colonial produce, Nuremberg manufactures, Swiss cheeses, &c. Schaffhausen is supposed to have originated about the 8th or 9th century; it was subjected by Austria in 1330, but has been independent since 1415.

The celebrated Falls of Schaffhausen are situated about a league S.S.W. from the town, where the Rhine breaks through a ramification of the Black-Forest mountains. The height of these Falls, which, in some respects are the grandest in Europe, varies, according to the season, from 50 to 75 ft., being greatest in June and July, when the river is swollen by the melting of the snow on the mountains. The stream, which, immediately above the fall, is about 300 ft. in width, precipitates itself over a ledge of limestone; four rocks projecting from which divide it in its descent into five portions. The greatest body of water falls between the first of these rocks and the castle of Laufen, on the S.E. bank of the river; from which, according to Murray, the best view of the Falls is obtained. "It is not," says Mr. Spencer, "the height of the fall, but the immense body of water broken into spray in the most picturesque manner over the rocks, that constitutes the great beauty of the cataract. In other respects, it cannot bear the slightest comparison with either those of Terni or the Staubbach." (*Germany and the Germans*, II. 61.)

In 1790, Lord Montagu, a young British nobleman of great promise, was drowned in a rash attempt to descend these Falls; and, by a curious coincidence, his death occurred nearly at the same time that his noble seat, Cowdrey House, near Midhurst, was burnt down. (*Ebel, Manuel du Voyageur; Picot, Statistique; Bowring, &c. on Switzerland, &c.*)

SCHAUMBURG-LIPPE (PRINCIPALITY OF),

one of the minor states of N.W. Germany, principally between lat. 52° 10' and 52° 30' N., and about long. 9° E., surrounded by the territories of Hesse-Schaumburg, Hanover, and Prussian Westphalia, exclusive of some detached lordships enclosed in the territory of Lippe-Detmold. Area, 217 sq. m. Pop., in 1849, 28,837, mostly Lutherans. It is hilly towards its S. extremity, but flat in the N., where the lake called the Steinhuder Meer occupies about 11,000 morgen. The productive portion of the surface comprises about 74,000 morgen, besides nearly 24,000 m. of forest-land, chiefly in the W. The soil is in general superior to that of Lippe-Detmold, and agriculture and cattle-breeding are more advanced. The inhabitants of both principalities employ their intervals from rural labour in spinning flax and weaving linens. Coal is raised in the S. to the value of about 20,000 dollars a year; and forms, with corn, wool, timber, and linen goods, a principal article of export. The constitution, which dates from 1816, is a limited monarchy; the powers of the prince being similar to those of the sovereign of Great Britain; the *Landstände*, or parliament, consisting of all the noble landed proprietors, with 4 deputies for towns, and 6 representatives of the peasantry. Appeal lies from the decisions of the courts of this principality to the superior court of Wolfenbüttel. Public instruction, as in Lippe-Detmold, is well attended to. Public revenue, about 130,000 thalers. There is no public debt. Schaumburg-Lippe has one vote in the full diet of the Germ. Confed., and with Lippe-Detmold, Hohenzollern, Reuss, Waldeck, and Liechtenstein the 16th place, with one vote in the committee. Its contingent to the army of the Confed. amounts to 240 men. (*Herghaus, &c.*)

SCHELDT (Fr. *Escaut*), a river of France and Belgium, which rises in the *dép.* Aisne, near St. Quentin, and runs mostly in a N.N.E. direction, through the *dép.* du Nord, and the provs. of Hainault, E. Flanders, &c., to Antwerp, after which it turns N.N.W., and, dividing into the E. and W. Scheldt, which enclose the islands of Beveland and Walcheren, enters the North Sea in about the same lat. as the Thames. Its entire length is estimated at about 200 m., its breadth at Dendermond is about 650 ft., at Antwerp, 1,700 ft.; and the width of its mouth varies from 2½ to 3½ leagues. It is navigable from Valenciennes. Its principal tributaries are the Scarpe, Lys, and Durme, on its W., and the Dender and Rupel on its E. side. St. Quentin, Cambray, Valenciennes, Tournay, Oudenarde, Ghent and Antwerp, are on its banks. Its current is slow; and in the lower part of its course, here it runs through a completely flat country, its banks are fenced by dykes to prevent inundation. It is connected by the canal of St. Quentin and other canals with the Somme, Seine, and Loire, and with the principal rivers and cities of Belgium, in its neighbourhood. During the commercial ascendancy of Antwerp the Scheldt enjoyed a larger share of traffic than any other European river; but its importance in this respect, though still considerable, has since greatly declined. "There was nothing," says Barrow, "on this noble river, in our progress upwards, that could give any impression of an active or extensive commerce. In sailing up or down the Thames, or on approaching London within 4 or 5 m., the multitude of sailing vessels affords indications not to be mistaken of the mercantile wealth and prosperity of London. But the Scheldt, when we ascended it, was a vacant river; we never met nor overtook a single sail; and, with the exception of 2 or 3 American ships, and some 10 or 12 vessels, mostly brigs, there was little appearance of shipping along the common quay of Antwerp." (*Tour de France*, p. 11.) This, however, was before the revolution of 1830 had made Antwerp once more the commercial emporium of Belgium; and in the interval, the city has certainly regained some portion of its former importance. (*See ANTWERP.*)

ELESTADT, a fortified town of France, *dép.* du Nord, cap. arrond., on the Ill, a tributary of the Scheldt, 26 m. S.S.W. Strasburg. Pop., in 1846, inc. 1,005. It was fortified by Vauban, and is naturally strong from its being in a great measure surrounded by water. It has an hospital, prison, communal college, manufactures of cotton and linen fabrics, iron, copper, and earthenware, for which last it was famous as early as the 13th century, with breweries, distilleries, &c. It is supposed to have been the ancient *Elst*, destroyed by Attila, where Charlemagne and his son Louis had afterwards a palace. The Swedes took it in 1713, but restored it to the French two years afterwards. (*Yugo, art. Bas-Rhin; Dict. Géog.*)

SCHENECTADY (Hun. *Schemnitz-Banya*), a famous mining town of Hungary, co. Honth, in a mountainous district, a tributary of the Gran, 46 m. N. by W. Pop. in 1837, with its suburbs, 17,028. The town is entered by an old and strong gateway, which leads to a long, narrow, steep street, wretchedly built and so hemmed in by sloping hills that there is no room for a row of houses on either side. At the end of this street is a mountain amphitheatre, the

proscenium of which is occupied by the churches and other large buildings; while the hill sides are covered with the white cottages of the miners embosomed among trees. (*Paget's Hungary*, i. 327.) The town has many good-looking houses, with shops and inns; but its fine old ruined castle appears to be the only edifice of much interest.

The mines of Schemnitz, which extend under the town, and have been wrought for several centuries, furnish considerable quantities of silver, whence gold is again extracted. The ores vary greatly in productiveness; but, speaking generally, the mines have not been very profitable. There are 6 principal veins or courses, each from 10 to 20 fathoms in thickness, running nearly E. and W. almost parallel to, and at the distance of from 60 to 300 or 400 fathoms from, each other, and connected by various small branches. In these extensive courses there are 12 royal mines, besides a number belonging to private individuals, who are obliged to dispose of all the ore they obtain to the royal smelting works at a fixed rate. The whole of these mines communicate with the emperor Francis's adit or level, at the depth of nearly 200 fathoms. (*Bright's Travels*, p. 149.) At a still greater depth is the adit of Joseph II., a magnificent work, 12 fathoms ft. in height by 10 ft. in breadth, extending from Schemnitz to the valley of the Gran, a distance of nearly 10 Eng. m. This adit, which is still unfinished, will carry off the water from mines which cannot now be wrought, and is so constructed that it may be used either as a canal or a railway. It has been already no fewer than 40 years in progress, and it is supposed that, when complete, it will have cost, at least, 400,000*l.* Dr. Clarke, who descended into the mines of Schemnitz, says, "All the Imperial mines are connected with each other; offering, in their whole extent, a subterranean passage which reaches to the astonishing length of 3,000 fathoms, nearly 3½ m. The sight of the interior of the Paquetstobin (one of the mines) convinced us that there are no mines in the world like those of Hungary. How wretched, in comparison, appear the mines of Cornwall and Wales, where it is sometimes necessary to creep upon the hands and knees, wet through, over all sorts of rubbish, to get from one shaft to another. The inside of a Hungarian mine may be compared to the interior arrangement of one of our best frigates, where space has been so husbanded, and cleanliness so strictly maintained, that nothing is seen out of its place, and there is room enough for every operation." (*Travels*, viii. 393, 8vo. ed.)

Dr. Clarke should, however, have added that the mines of Cornwall and Wales are wrought by private individuals for the sake of profit only, whereas the Imperial mines which he visited are wrought at the expense of government, to which profit is a secondary consideration. Hence the greater outlay on the latter; hence, also, in part, at least, their comparative unproductiveness, and the bad and costly manner in which, according to Mr. Paget, all the Austrian mining establishments are conducted.

The ore, besides silver and gold, contains lead, and sometimes iron, copper, zinc, or arsenic. In consequence of the want of wood and water but little ore is smelted on the spot, being principally sent to Neusohl or Kremnitz. About 20,000 miners are employed in the Schemnitz district.

Mr. Paget states that the officers and workmen are all very indifferently paid; and hence there is not unfrequently a good deal of embezzlement. The workmen, who are paid by the piece, are not permitted to earn more than about 3*s.* a week: it would seem, indeed, rather to be the object of the government to keep up the mines for the employment they afford, than for the inconsiderable profit made by them.

A school of mining, in imitation of that at Freiberg, was established at Schemnitz in 1760, which has 5 professors and about 200 students, who are all educated free of cost, several of them being farther furnished with an annual donation of from 20*l.* to 30*l.*, to assist in their maintenance. It is believed, however, that this school is, in respect of science and practical knowledge, far behind that of Freiberg, and most other mining schools. It has a pretty good library, but its collection of minerals is very inferior. (*Paget's Travels in Hungary*, i.)

SCHENECTADY, a town or city of the U. States, New York, cap. co. of its own name, on the Mohawk, a tributary of the Hudson, and on the Erie canal, 16 m. N.W. Albany, with which it is connected by a railway. Pop. in 1840, 6,784. The compact portion of the city consists of about 20 streets, with a court-house, co-offices, prison, about 9 or 10 churches, several banks, iron and brass foundries, carpet and tobacco factories, a paper-mill, and various superior public schools, the chief of which is Union College. This establishment, founded in 1796, and incorporated in 1794, is now one of the principal institutions for public instruction in the state. It has 12 professors and other instructors, and a library of

11,000 vols. (*Amst. Museum*), and had, in 1855, 241 students. Its position on the Erie canal makes Schiedam an important entrepôt, and it has a flourishing and increasing trade. It is said to occupy the site of an antique Mohave village, and was incorporated in 1795. (*New York Gaz.*)

SCHIEDAM, a town and port of S. Holland, cap. mnt., on the Scheldt, a tributary of the Meuse, 3 m. W. Rotterdam, and 1 m. W. from the Maas. Pop., in 1800, 12,001. It is well built in the usual style of Dutch towns, and has numerous churches, an exchange, a Latin school, a chamber of commerce and manufactures, and a branch of the Society of Public Good. "It is conspicuous both by the smoke which issues from the chimneys of its distilleries and the vast number of windmills by which it is surrounded. The whole horizon, in fact, in the direction of Schiedam, seems animated with life and bustle. Schiedam is the chief seat of the manufacture of Dutch gin, or Holland. The quantity of that spirit produced here annually is very great, there being in the town as many as 100 distilleries while many thousands of pigs are supported by the refuse of the malt employed in the manufacture. The gin of Schiedam is strong, but mild in flavor, and is usually sold in Holland for 1d. a bottle, or 4s. 6d. a gallon; the price of the gallon on its importation into England being increased by freight and duties to about 30s. or 35s." (*Chambers's Tour in Holland*, i.) The duty on Holland, which formerly amounted to 50d. a gall., was one of the most objectionable in our tariff. It is now (1855) reduced to 1s., but it is still too high. The duties of Holland for home consumption, which, once amounted to about 100,000 galls., were reduced, in 1849 to 25,017 galls. We doubt, however, whether the consumption be really diminished in the same proportion. The exorbitance of the duty has in part at least, thrown the trade into the hands of the smuggler, to the injury alike of the legitimate trader and the revenue. Schiedam has rope-walks, building-docks, and a small though convenient port on the Scheldt. It sends 1 deputy to the States of the prov.

SCHWABACH, a town of Bavaria, circ. Middle-Franconia, 8 m. S. S. W. Nuremberg. Pop., in 1845, 10,000. It is walled, and pretty well built, having several Pro-

and 8 of the rural pop. (*Boyle's*); but *Herschmann* says there are 6 of each. The deputies are elected every 5 years. The parliament has the control of the public funds, and no new law can be adopted without its consent. The principal judicial courts are at Rudolstadt and Frankenhause, from which appeal lies to the superior tribunal of Berlin, in Anhalt-Dessau. Public revenue about 200,000 florins. The public debt has been in rapid process of diminution since 1821, and in 1845 it amounted to only 100,000 florins. This principality furnishes 100 men to the army of the German Confederation. Chief towns, Rudolstadt, the cap., on the Saale, with 4,500 inhab., and Frankenhause with 5,000 inhab., and a considerable trade in corn and wool.

SCHWARTZBURG-SONDERSHAUSEN, a principality of central Germany, between lat. 51° 15' and 51° 30' N. and about long 11° E., bounded by territories belonging to Prussia on every side except the W., where it joins a detached district of Saxe-Gotha. Area, 280 sq. m. Pop., in 1845, 65,000, mostly Lutherans. Surface undulating, and traversed by several affluents of the Unstrut, flowing in a W. direction. The lower part of the country yields more corn than is required for home consumption, the higher portion has extensive forests and timber and potash are amongst its principal products. Iron is found, and furges and hardware factories are the principal manufacturing establishments, though some woollen and linen goods are woven. The government is an unlimited monarchy. Appeal may be made from the judicial courts to the superior court of Saxe in Anhalt-Dessau. Public revenue, in 1845, 145,000 crowns; expenditure, 182,000 ditto. Public debt, about 215,000 ditto. Contingent to the army of the Confed., 461 men. Chief

towns, Sonderhausen, the cap., on the Wipper, with 2,500 inhabitants; and Arnstadt (which see).

This princip., like the preceding, has one vote in the full diet of the Germ. Confed., and shares the 16th place and one vote in the confederation with Oldenburg, and the Anhalt principallities. (*Boyle's*, &c.)

SCHWEIDNITZ, a town of Prussia, Silesia, cap. circ. Silesia situated at the Riesengebirge mountains, on the Westritz, in a fertile and beautiful country, 30 m. S. E. Breslau. Pop. about 12,000. It is well built, and strongly fortified, the fortifications which had been dismantled by order of Napoleon in 1807, having been reconstructed since the peace on an improved plan, and rendered more formidable than ever. Its motto, formerly the residence of the Pion. duke, is now a workhouse. It has a magnificent Rom. Cath. church, a fine town-house, a gymnasium, a house of correction, and the usual government offices of the cap. of a circ.; with manufactures of cotton, cottons, linens, &c. Near it is the castle of Fürstenstein, a fine antique feudal edifice, bought by the king of Prussia.

SCHWYTZ or **SCHWEITZ** (CANTON OF), one of the 4 Forest Cantons of Switzerland, which gave its name to the Confederation, in the central part of which it lies, between lat. 46° 45' and 47° 30' N. and long 8° 30' and 9° E., having N. and N. E. the canton of Zurich and S. Goth., S. Glarus, S. Uri and Unterwalden, and W. Zug and Lucerne. Area, 280 sq. m. Pop., in 1845, 64,161. Nearly the whole surface is mountainous, the highest rises about 6,500 ft., and the highest about 6,100 ft. above the sea. (*Boyle's*, &c.) The Romans, the fall of a portion of which in 1845 had most destructive effects, is partly in this canton and partly in that of Zug. The Rhodan and the Murt are the principal rivers, the former falls into the Lake of Zurich, which forms most part of the N. boundary of the canton, and the latter into the Lake of Lucerne, which limits the canton on the S. W. The Linth canal, between the lakes of Walenstadt and Zurich runs along its N. E. extremity. The soil and climate are more favorable to cattle breeding than to agriculture, which is so much neglected, that in some valleys, according to Picot, the plough and flail are unknown. On the other hand, however, the habits are distinguished by their superior treatment of live stock; the cattle of Schwytz are accounted among the best in Switzerland, and upwards of 20,000 head are annually sent from the S. side of the Alps to depasture on the mountains during summer. Near Küssnacht, on the Lake of Lucerne, the vine is grown, and apples, which produce show, are tolerably abundant. The forests are extensive, and the supply of turf is all but inexhaustible; cotton thread, and this in very small quantity, is almost the only article of manufacture. The principal exports are cattle, cheese (sent mostly across Mt. St. Gotthard), and timber. The transit trade is of little importance, and on account of the badness of the roads, is mostly confined to the lakes and navigable parts of the rivers.

The government is a pure democracy, the sovereign power residing in the people at large. The male pop. above 16 years of age form the General Assembly of the canton, which meets every 3 years, on the first Monday in May, at Schwytz, to appoint, by show of hands, the landammann, and other supreme officers, the deputies to the Diet, and to deliberate on alliances, declarations of war, treaties of peace, &c. A council of high functionaries and 170 ordinary members assemble usually twice a year, to prepare instructions for the deputies, and hear their reports, and another council of 30 members is constituted with the general executive power. The canton is divided into 6 districts, each of which has its own council and tribunal of primary jurisdiction, the decisions of which are final in more than the amount of 50 florins. The chief tribunals are at Schwytz, and is composed of members, two thirds of whom belong to the districts of the cap., and the rest to the other districts of the canton. The inhabs. are exclusively R. Catholics, subordinate to the bishop of Chaux. Public education is more backward in this than in most other cantons, and it has no public library. At 14, every male inhab. is enrolled in the militia, and Schwytz furnishes a contingent of 600 men to the army of the Confederation, in which it holds the fourth place immediately after the three directorial cantons. Schwytz, the cap. of the canton, at the foot of Mount Mythen, 20 m. S. E. Zurich, has about 5,000 inhabs. (*Pratt's Statistics of the Swiss*; *Atlas*, *Mannus*, &c.; *Boyle's Switzerland*, *passim*.)

SCIACCA (an *Therma* *Antiquaria*), a town and port of Sicily, island Girgenti, on the S. coast, nearly 30 m. S. E. the ruins of Agrigento, and 30 m. N. W. Girgenti. Pop., in 1835, 12,000. The town, situated on the declivity of an eminence rising from the bay, is surrounded by an irregular wall, in tolerable repair, with 5 towers towards the sea, and the castle of Lanza at its E. angle. At a distance it has a respectable appearance, but notwithstanding its large churches, convents, and magnificence, it appears to be poverty-stricken and

fratched. Barth says, that it has not recovered from the influence of the long-continued and deadly floods between the hills of Lusa and Parolito, in the 16th century (*Switzerland's Travels*, ii. 249., &c.)

Some of the famous hot springs, whence the city had its ancient name, are a little without the walls towards the E. But the stone-baths, the construction of which was ascribed, in antiquity, to Dædalus, and now called the Baths of St. Calogero, are on the summit of an isolated mountain, about 1 m. N.E. of the town, and correspond exactly with the description of Diodorus Siculus. They consist, as of old, to be frequented by patients, and consist of several subterranean grottoes, or caverns, the outer one of which has seats excavated in the rock. (*Howe's Classical Tour*, ii. 86.; *Smeyth's Sicily*, p. 216.)

Sciaca is one of the principal ports on the S. coast of the island, for the exportation of corn, and the rock upon which the town stands is, in numerous places, hollowed out into caverns, or corn cellars. In summer ships anchor at about 1 m. off town, in from 7 to 12 fathoms, on a bottom of sand and clay; but being exposed to every wind from the S.E. round to the W., it is not resorted to in winter, except by boats and flat-bottomed craft. (*Smeyth's Appendix*.)

Agathocles, tyrant of Syracuse, famous alike for his great talents, perfidy, and cruelty, was a native of Sciaca, where he was born some 360 B.C. He was of low origin, his father being a potter banished from Reggio, his native city. (*Biographie Universelle*.) Fazelli, the historian of Sicily, was also a native of this town.

SCILLY ISLANDS, a group of islands, belonging to England, lying about 30 m. W. by S. from the Land's End, supposed by some to be the *Cassiterides*, or tin islands of the ancients. There are supposed to be, in all, about 150 islands and rocks, but there are only about half a dozen of any importance. St. Mary's, the largest, is said to contain about 1,540 acres: the entire area of the group, as given in the population returns, is only 8,570 acres. In 1841, they had a pop. of 2,882. From their situation they necessarily have a mild equable temperature; and though fogs be common, the islands are very healthy. They produce good barley, rye, and oats, the latter being principally of the variety called *villier*, or *oena nuda*. Potatoes are extensively cultivated. Horses and cattle small; sheep numerous, and of good quality; sea-fowl are found in great numbers, and partridges are, also, abundant. There are shrubs, but few or no trees. The inhabitants used to make vast quantities of kelp; they are also expert fishers, and act as pilots to such ships as require their services. already stated, the islands are generally supposed to be the *Cassiterides*, or tin islands of the ancients. But it is most probable that the W. extremity of Cornwall is included under this term; and, at all events, there now no trace of tin, nor, indeed, of mines of any sort, any of the islands. Hough-town, the capital of the islands, and their only town, is situated on the W. side of Mary's. It has a pier and a custom-house, and is a place of some consequence, being defended by a fort, and the Star Castle, with a small garrison. Persons accused of felonies are sent to Cornwall to be tried at the co. assizes; but all minor offences and suits are tried by a court consisting of twelve of the local inhabitants, delegated by the proprietor of the island under the duchy of Cornwall, of which they are a part. This court sits once a month at Hough-town, St. Mary's, for the trial of cases. Vacancies in it are usually filled up by election; but it may be dissolved fresh appointment made by the proprietor.

The position of the Scilly Islands renders them of considerable importance in navigation. Lying at the point of junction, as it were, of the English and Irish Channels, ships passing from the one to the other, should the wind be unfavourable, often stop under these islands: it is sometimes, also, resorted to for vessels to take shelter among them, when beat about at sea in bad weather, and gale from the E. usually brings in numerous vessels. There are four principal sounds or roads between the islands, exclusive of smaller inlets. Of these, St. Mary's, between the islands of St. Mary's and Agnes, is the best; but it is generally the safest, entering it, or any of the other roads, to make it safe. The latter are always in readiness to offer assistance.

A lighthouse of the first class was erected on St. Agnes, the most southerly of the group, in 1880, the lantern is elevated 135 ft. above high water mark. According to the ordnance survey, in lat. 49° 52' 38" N. 19° 23' W.

Withstanding the warning given by this light, ships have been the scene of numerous shipwrecks. The most distressing of these catastrophes was on the night of the 2d of Oct. 1707, when the fleet of the Mediterranean, under the gallant Sir Cloudesley Shovel, got foul of the islands: the ship bearing the admiral and two other line-of-battle

ships struck upon the rocks near the lighthouse, and were totally lost, with every soul on board. Some of the other ships were in extreme danger. It is not exactly known how the accident arose. The night was dark, but there was very little wind, otherwise the whole fleet must have been destroyed. It is probable that the light had been mistaken for another. The body of the admiral was cast ashore, and buried in St. Mary's; but it was soon after removed to Westminster Abbey, where

articles of produce are silk, mastic, figs, lemons and oranges, wine, oil, cotton, almonds, &c. Its mineral wealth has been but little explored, but it contains abundance of marble, jasper, and a kind of green earth, resembling verdigrise.

The wines of Chios, especially those produced in the district of *Arvisia*, were amongst the most esteemed of any in the ancient world. They have been celebrated by Virgil (*Ecl.* v. lin. 72.); and Horace asks

"Quo Chium prole cadum
Mereatur?"

According to Pliny, Chian wine was served up by Julius Cæsar at his most splendid entertainments; and it is thought worthy of notice, that Hortensius left a very large

belonged to the capital.

The latter, on the E. coast of the island, constructed by the Genoese, along the sea shore at the foot of the mountains (an. *Pellensis Montes*), on the slope of which stood the ancient city, is the cleanest, handsomest, and most desirable town, as a residence, in the Levant. It is well built, and extended, previously to 1822, with its gardens and villas, for about 4 m. along the sea. Its houses are commodious, and its shops and warehouses were then well furnished; it had numerous Greek and R. Catholic churches, with schools, and even a college. The silk manufacture was carried on upon a large scale, and the velvets, damasks, and other silk goods of Scio, were highly esteemed. It had been for many years the principal entrepôt of the Archipelago, and carried on an extensive and flourishing commerce. Scannini says that the shallowness of its harbour, which was suitable only for the smaller class of vessels, was the only drawback on its prosperity; but this defect was to a great extent compensated by the excellence of its roadstead, which affords secure anchorage, and every facility for getting to sea. (*Tournefort*, i. letter 9.; *Sommiers's Travels in Greece and Turkey*, cap. 37.; *Walpole's Journal*, quoted by Clarke; *Cornwall's Letters from the East*, &c.)

Unhappily, however, these statements apply to the

past more than to the present state of this fine island. In 1823, during the progress of the revolutionary struggle in Continental Greece, a Greek force landed in the town, and a part of the inhab., who had hitherto pursued a strict neutrality, having joined them, they attacked and took the citadel, defended by a small Turkish garrison, which they put to the sword. A strong Turkish force having landed immediately after, took the most desperate revenge for the outrage that had been committed. The island was given up to indiscriminate pillage and massacre. The inhab., taken by surprise, and enervated by long peace and prosperity, offered no effectual resistance to their murderous assailants. It is said that above 20,000 individuals were put to the sword; that as many more, principally women and children, were carried off and sold as slaves; and that the capital was converted into a heap of ruins, and every part of the island laid waste! These statements are most probably a good deal exaggerated; but still there cannot be the shadow of a doubt that the visitation was of the most destructive and tremendous description. Whether Scio be ever destined to recover from this wholesale butchery is problematical; but it were absurd to expect that it should revive so long as it remains in the deadly grasp of the detestable barbarians who have perpetrated such atrocities. Such of the principal inhab. as were fortunate enough to escape being massacred, immediately fled from the island; and that commerce which had been its principal support has been transferred to Syra, Napoli, and other places. (*Carmichael's Letters from the East; Tract on the Greek Revolution*, by the Rev. T. S. Hughes, Lond., 1829; &c.)

In antiquity, Chios gave birth to many distinguished individuals; among whom may be specified Ion, the tragic poet, Theopompus, the historian, Theocritus, the sophist, and Metrodorus, the physician and philosopher. But Chios aspires to a still higher honour, that of being the native country of the first and greatest of poets.

"The blind old man of Chios's rocky side,"

of whom Voltaire has justly as well as forcibly said,—*quod neque ante illum, quem ille imitaretur; neque post illum, qui cum imitari posset, inventus est.* (Lib. I. cap. 5.) And it is admitted by the ablest critics that, of all the cities that contended for the honour of having been the birth-place of Homer, the claims of Chios and Smyrna were apparently the best founded.

The Chians were, for some time, in possession of the empire of the sea. They are said to have been the first

who traded in slaves; and the oracle, informed of the fact, declared that it had drawn upon them the anger of heaven; one, says Bartholomæi, of the noblest, but at the same time, least regarded answers the Gods have communicated to man. The Chians took a prominent part in the great revolt of the Ionian cities against the Persians, by whom they were afterwards reduced, and punished with great severity. At a subsequent period we sometimes find them on the side of the Athenians, and sometimes on that of the Lacedæmonians.

"Moderate in prosperity, blameless towards their neighbours, and using their increasing wealth and power for no purpose of ambition, but directing their politics merely to secure the happiness they enjoyed," the Chians were amongst the most respectable of the Greek states. (*Milford*, iii. 316, 8vo. ed.)

They became the allies of Rome during the wars with Mithridates. After innumerable vicissitudes Scio came, in the middle ages, into the possession of the Genoese, who, as already stated, built its capital. It was taken by the Turks in the 16th century. (Exclusive of the authorities referred to above, see *Ancient Universal History*, viii. 296, &c., 8vo. ed.; *Celleri's Geographia Antiqua*, ii. 19.; *Voyage d'Anacharsis*, cap. 72., &c.)

SCOTLAND, one of the secondary European kingdoms, comprising the Northern and smaller portion of the island of Great Britain, and forming one of the three great divisions of the United Kingdom of Great Britain and Ireland, between lat. 54° 38' and 58° 40' 30" N., and long. 1° 46' 30", and 6° 3' 30" W., or, including the Hebrides, 7° 44' W. It is surrounded by the ocean on all sides, except on the S., where it is separated from England by the Solway Frith, the Cheviot hills, and the Tweed. Its greatest length, N. to S., from Dunnet Head to the Mull of Galloway, may be estimated at about 280 m.: its breadth is very unequal; varying from 32 m., between Alloa on the Frith of Forth and Dumbarton on the Clyde, to 146 m. between Buchanness Point in Aberdeenshire and Rowanmoan Point in Ross-shire. Its subdivisions, area, and pop., are as follow:

Counties.	Total Area in sq. m.	Area of Land in Acres.	Area of Lakes, &c. in Acres.	Pop. in 1851.	Pop. in 1841.	Acres of Land to an Individual.

* The various totals of the above counties include 4,715 persons in burrows, and 1,754 persons in towns, &c. in harbours.

Scotland is extremely irregular in its surface and outline, and, compared with England, may be said to be sterile, rugged, and mountainous. This is so much the case, that, estimating the whole extent of the country, inclusive of islands and lakes, at 19,000,000 acres, perhaps

not more than 6,000,000, or, at most, a third part, are arable; while the surface of England and Wales, amounting to 37,000,000 acres, comprises at least 29,000,000 acres, or more than three fourths, of arable land. With the exception, indeed, of a few rich allu-

vial tracts, there are no extensive vales in Scotland; its surface, even where least mountainous, being generally varied with hill and dale. It is divided by the Frith of Clyde, Loch Lomond, and the Grampians, into the two grand divisions of the Highlands and Lowlands; the former comprising the N. and the latter the S. part of the country. The Highlands again are divided into two unequal parts by the remarkable narrow and deep valley through which the Caledonian Canal has been constructed. The arable lands in the Highlands are mostly confined to the E. parts of Ross and Cromarty, a slip along the S. side of the Moray Frith, and the E. parts of Aberdeenshire. With these exceptions, the far greater part of the Highlands consists of mountains, moors, and morasses; and in various parts, especially along the W. coast, they are extremely bleak and barren. In Caithness there is a considerable extent of low ground, but it is mostly moor. The Lowland division of the country comprises, also, a large extent of mountainous districts; but the mountains are not so lofty nor so bleak and rugged as in the Highlands, and there is a much greater extent of low fertile land.

The mountains of Scotland run generally in chains from S.W. to N.E., though there are many detached groups not following this distribution. They are frequently rocky, bare, and precipitous; though mostly covered with heath. The principal and most celebrated chain is that of the Grampians, which comprises nearly all the highest of the Scottish mountains, except Ben Nevis. This stony girdle extends across the island from the arms of the sea, called Loch Etive and Loch Fyne, in Argyleshire, E. by N. to Stonehaven on the E. coast, and Echt, in Aberdeenshire, forming, as already stated, in the greater part of its course, the line of demarcation between the Highlands and Lowlands, and separating the waters which flow into the Forth, Tay, and South Esk, from those which join the Spean, Spey, and Dee. Its most elevated summits are near the head of the Northern Dee. Ben Macdhu, 11 m. N.W. Braemar, lat. $57^{\circ} 6' N.$, long. $3^{\circ} 37' W.$, 4,390 ft. above the level of the sea, is at once the culminating point of the Grampians, and the highest of the British mountains, being 30 ft. higher than Ben Nevis, which was long considered as the highest of the Scotch mountains, and 819 ft. higher than Snowdon in Wales. The other principal summits in the Grampian chain are Cairntoul, 4,245 ft.; Cairngorm, 4,095 ft.; Ben Lawers, 3,945 ft.; Ben Avon, 3,967 ft. in height, &c. Ben Lomond, in Stirlingshire, 3,195 ft. in height, on the E. side of Loch Lomond, the best known of all the Scottish mountains, also belongs to this chain. The Grampians are distinguished by their sterility, and desolate aspect; their sides in many places exhibiting vast perpendicular ledges of rock. The principal passes through the chain are those of Aberfoyle, Leni, Glenshie, and Killiecrankie.

Ben Nevis, alluded to above, lies to the N.W. of this chain, in about $56^{\circ} 49' 30'' N.$ lat., long. $5^{\circ} W.$, being separated from the Grampians by the moor of Rannoch. It rises to an elevation of 4,370 ft. above the sea. Its summit, which commands a magnificent view extending from the Paps of Jura to Cuchullin in Skye, Cairngorm, Ben Macdhu, &c., is, during the greater part of the year, covered with snow. From Ben Nevis N. to Loch Broom several mountains rise to nearly 4,000 ft. in height; and the country is so thinly inhabited that frequently for many miles not a house is visible. But from Loch Broom to the Wrath the surface diminishes considerably in elevation, and, though bleak in the extreme, is, for some distance from the W. coast inland, not more than about 1,000 ft. above the sea.

The Lowlands, the Sidlaw and Ochill hills, which parallel to the Grampians, nowhere rise to 2,500 ft. The highest Broadlaw, on the N. border of Dumfriesshire, the highest mountain in the S. of Scotland, is only 2,741 ft. above the sea. The more elevated tracts in the Lowlands, including the mountains of Roxburgh, Dumfries, Selkirk, and Lanark shires, are frequently fertile, and covered with a fine sward, affording good pasture for sheep.

Though the valleys and level tracts in Scotland be of limited extent, as compared with those of England, some of them are extremely fertile, and they are generally well cultivated. The case of Stirling and Falkirk, on the banks of the Forth; that of Strathearn and Perth, on the Tay; and the mense of Berwickshire, the alluvial tracts, are not inferior, in point of productiveness, to any land of the empire. Teviotdale, the low lands along the Teviot; Tynedale, or the Howlands along the Tyne, in E. Lothian; the Howlands or the low ground along the Eden in Fifeshire and Strathmore, or the low grounds between the Grampian Mountains and the Ochill Hills, consist, for the most part, of rich loamy soil, and are extremely fertile. It should also be observed that the general character of the surface makes the lower parts of the country appear to be much less fruitful than they

really are; the hollows between the small eminences being often extremely fertile, and the eminences themselves, even when they are unsuited to tillage, frequently furnish excellent pasture. This is particularly the case in the S.W. counties: large tracts of land in Galloway and Dumfriesshire that let from 20s. to 30s. an acre and upwards, would appear to one not well acquainted with the country and its capabilities worth little or nothing. A good deal of level but generally high-lying land, especially in the Highlands, and in some parts also of the lowlands, consists of moors; having for the most part a clay subsoil, covered with peat earth or moss impregnated with water, not unlike the bogs of Ireland. Many of these moors are of very considerable extent; the largest, probably, as well as the most desolate and worthless, is the moor of Rannoch, to the S. of Ben Nevis, comprised in the shires of Argyle, Perth, and Inverness.

Rivers.—Scotland has numerous rivers, several of which are of considerable size. They differ from those of England in being more precipitous, rapid, interrupted by cataracts, and subject to sudden overflowings. Except the Clyde, the others mostly disembogue on the E. coast. The Tweed, which rises on the confines of Dumfriesshire and Lanarkshire, falls into the N. Sea at Berwick, after a course of about 100 m., only a small portion of which is navigable. Proceeding northwards, the next river of any considerable magnitude is the Forth, which rises on the E. side of Ben Lomond, and has in general an easterly, but very tortuous course to Kincardine, where it unites with its great estuary, or rather arm of the sea, the Frith of Forth, the *Bodotria* of Tacitus. It receives, on its N. side, the Teith and Allan, and from the S., the Devon, &c.; Aberfoyle, Stirling, and Alloa are on its banks. The Forth is rapid for some considerable distance from its source; but during the greater part of its course it runs through a flat country with many windings: vessels of 300 tons ascend the Forth as far as Alloa, and those of 70 tons ascend to Stirling. It is connected with the Clyde by the great canal from Grangemouth to Dunglass. The Tay is the largest of Scotch rivers, and is supposed to carry more water to the sea than the Thames, or any other river in Great Britain. (See TAY.) The N. and S. Esks, Dee, Don, Spey, and Findhorn, all discharge themselves on the E. coast; and in the N. division of the Highlands are the Nairn, Ness, Beaulieu, &c. The Spey is one of the largest rivers in Scotland, and certainly the most rapid. It rises in Loch Spey, and pursues mostly a N.E. course to the Moray Frith, which it enters after a course of about 96 m. It receives no large tributary, but innumerable mountain torrents, in consequence of which it is subject to frequent and destructive inundations. The Clyde, the *Glotta* of Tacitus, though not the largest, is decidedly the most important Scotch river in a commercial point of view, Lanark, Hamilton, and Glasgow being situated on its banks. It rises in the highest part of the Lowlands, close to the sources of the Tweed and Annan; and runs at first N., but afterwards generally N.W., to the Frith of Clyde, with which it unites 7 or 8 m. below Glasgow, after a course of between 70 and 80 m. It receives from the S. the Douglas, Nethan, Avon, Cart, &c.; and from the N., the Kelvin, Leven, &c. The Clyde has been rendered navigable for vessels of 800 tons, as far as Glasgow. (See CLYDE, and GLASGOW.) The Southern Dee, Nith, and Annan, flowing into the Solway Frith, are the only other streams it is necessary to notice.

The *locks*, or fresh-water lakes of Scotland, are numerous, and highly distinguished for their picturesque scenery. Loch Lomond (which see, *ante*, p. 193.) is the largest lake in Great Britain; being about 24 m. in length, and from 7 m. to $7\frac{1}{2}$ m. across in the broadest part. It is estimated to cover about 25,000 acres. Lochs Awe, Ness, Maree, Tay, Shin, &c., in the shires of Argyle, Ross, Perth, and Sunderland, are among the other principal lakes. Most of these are long, narrow, and deep, filling up the bottoms of the valleys between the mountains. They abound with trout, perch, pike, &c.; but Loch Leven, in Kinross-shire, is the only lake that yields any revenue to its proprietors.

The coasts of Scotland are mostly bold and rocky; and on the W. side, in particular, they are very much indented by arms of the sea, termed friths, and lochs, that extend far inland, and, for the most part, carry deep water to their very head. These friths and inlets are of considerable importance in a commercial point of view, especially as few of the rivers are navigable to any great distance inland. On the E. coast are the friths of Forth and Tay, which, especially the first, are of great importance, as affording facilities of communication to the richest districts of the country; N. of the latter, on the same coast, are the friths of Moray, Dornoch, Cromarty, &c.; on the W. coast, the frith of Clyde, and Lochs Broom, Torridon, Linnhe, Fyne, &c., deeply indent the country. The harbours of Leith, Grangemouth, Queensferry, Burntisland, &c., are in the Frith of Forth, and

those of Dundee and Perth in the Frith of Tay. Between the Tay and Buchan Ness are the harbours of Montrose, Aberdeen, and Peterhead: the Frith of Cromarty, N. of Buchan Ness Point, is unquestionably the best asylum for shipping on the E. side of Great Britain, and one of the finest, indeed, that is anywhere to be met with. Between the latter and Duncansby Head are the small harbours of Wick, St. Clair's Bay, &c. From Cape Wrath to the Clyde, the narrow arms of the sea, though deep and secure, are little frequented. The ports of Greenock and Glasgow are the principal in the Frith of Clyde, and enjoy an extensive trade; but Lamlash Bay, on the E. side of the Isle of Arran, is the best harbour in this neighbourhood. There are some pretty good harbours on the coasts of Wigton and Kirkcudbright shires. The principal headlands are St. Abb's Head, Fife Ness, Peterhead, Tarbet Ness, and Duncansby Head, on the E.; Dunnet Head and Cape Wrath, on the N.; Ru-Rea, Ardnamurchan, and the Mulls of Oe and Cantire, on the W.; and the Mull of Galloway and Burrowhead, on the S. coast.

There are few or no islands off the E., but many of large size lie contiguous to and off the W., coast. These are mostly included under the Hebrides (which see). The islands of Orkney and Shetland (which see) lie off the N. coast of Scotland; the Orkneys, the nearest, being separated from the mainland by the Pentland Frith, 6 m. across.

General Aspect of the Country.—The finest parts of the low country of Scotland usually want the rich luxuriance of an English landscape. Within the last sixty or seventy years a great deal has, no doubt, been done in the way of raising plantations; and the strictures of Dr. Johnson, as to the deficiency of wood, would at present be quite inapplicable, however just they may have been when dictated. In Scotland, however, plantations are not spread generally over the country, but are mostly congregated in the neighbourhood of gentlemen's seats, while in many large tracts they are wholly wanting. In most parts, too, we look in vain for those hedgerow trees that give so much of a woody appearance to the southern part of the island. Generally, also, the inclosures are a good deal larger than in England; and the fences being either stone walls (dykes) or hedges, that occupy only a small space of ground, having little of the breadth and roughness of those of England, the country, however well farmed, seems to an Englishman deficient in vegetation and verdure, and cold and comfortless. On the other hand, however, the succession of new objects presented by the unevenness of the surface, the rude grandeur of the mountains that every where bound the prospect, and the striking contrast frequently afforded between rich, well-cultivated, low grounds, and the contiguous high barren ridges, take from the Scottish landscape the tameness and monotony that prevail in many parts of England, and render it singularly picturesque and impressive.

Climate.—Scotland has a more rigorous climate than England; but owing to the proximity of most parts of the country to the sea, and the numerous friths and deep bays, by which it is penetrated, it is less severe than might, from the lat., be expected. The mean annual temperature of places near the level of the ocean, throughout the country, averages about 46½° Fah. At Edinburgh, which is from 300 to 400 ft. above the sea-level, the mean temperature of the year is 47·8°, which may be taken as that of the inland parts generally in the S. of Scotland, the mean of the coldest month being 38·3°, and of the warmest, 59·4°. A great deal of rain falls in Scotland, but very unequally; for on the E. coast it ranges from 21 to 30 in.; whereas, on the W. coast and in the Hebrides, it ranges from 30 to 44 in. The average fall of rain in Edinburgh is about 22½, and in Glasgow about 29·65 in. Excess of humidity, and the occurrence of heavy rains in August, September, and October, and of cold piercing E. winds, especially along the E. coast, in the months of April, May, and the first half of June, are the great drawbacks on the climate of Scotland. It is rare, indeed, that the crops suffer from heat or drought; but they frequently suffer from wet and from violent winds, especially in the W. part of the country. The climate is, however, highly salubrious, and favourable alike to longevity, and to the development of the physical and mental powers.

Geology.—A line drawn in a N.E. direction from the m. of the Clyde to Stonehaven, on the E. coast, separates the two principal geological regions. The first, to the N. of that line, is mostly composed of primary rocks, granite, gneiss, mica-slate, covered at the foot of the mountain chains with beds of conglomerate and red sandstone; whereas the second, to the S. of the above line, is the region of transition formations, in which rocks of that kind mostly prevail, overlain in various parts by trap, red sandstone, and coal beds: granite is, however, largely developed in the S.W. of the kingdom, in the stewartry of Kirkcudbright, at Criffel, and in the Cairnsmuir range. Little if any coal exists in the primary division of the

country; few metals are discovered there, and its most important mineral products are building-stone and roofing-slate. Some lead mines are, however, wrought at Strontian, in Argylesh.; and in Inverness-sh. plumbago of inferior quality has been found, imbedded between laminæ of mica slate. None of the secondary calcareous formations, so extensively prevalent in England, have been found in Scotland, nor any tertiary formations.

Coal and Iron.—The great coal district of Scotland may be considered as bounded on the N. by a line drawn from the mouth of the Tay to the N. extremity of the Isle of Arran, and on the S. by another line drawn from St. Abb's Head to Girvan, in Ayrshire. These limits comprise a band of country, in which are several large coal-fields detached from each other, the most valuable extending along the banks of the Forth, with a breadth of from 10 to 13 m. on either side the river. The Edinburgh coal-field, to the S. and E. of that city, occupies an area of 80 sq. m.; and from Bathgate the coal deposits extend W. to Glasgow and Paisley, and have, in fact, been the principal cause of the wonderful progress made by the former in manufactures, wealth, and population. There are several small detached coal-fields in Ayrshire and some of the other S. counties. Iron is of frequent occurrence in the coal districts, especially in Lanarkshire, where the ores are of the very best quality; and the iron trade of that county, and of Scotland generally, has latterly increased with unexampled rapidity, and is now of the greatest importance. So much so is this the case, that, while in June, 1835, there were only 29 furnaces in blast, estimated to produce 75,000 tons of iron, it appears from the following statement, obtained from private sources, on which every reliance may be placed, that on the 1st January, 1851, there were 105 furnaces in blast, producing at the rate of 600,600 tons a year! There were then also 37 furnaces out of blast.

The whole of the above iron is made by means of heated air, with the exception of one furnace at Carron.

The bar iron trade of Scotland has not made the progress that might, perhaps, have been anticipated. We subjoin some details.

Malleable Iron Works in Scotland, 1st January, 1851.

* We have estimated the produce at the average rate of 110 tons per week for each furnace, without making any allowance for stoppages. Others estimate the produce at 120 tons per week per furnace, allowing a fortnight for stoppages. On this hypothesis the total produce would be 630,000 tons, but we are assured that the estimate we have given comes the nearest to the truth.

† Standing last year: lately sold, and about commencing.

— The returns for 1841 include 4,715 persons resident in barracks in various counties, and 1,775 persons on board ships in harbour.

ice of tithes, and, in most instances, of poor and of all oppressive public burdens; the abolition of sub-letting, and the inheritance of ease by the heir-at-law; the introduction of sheep-farming into the Highlands, and the improvement made in the construction of sorts of farming implements. The general use of thrashing machines, many of which are driven by steam, and of ploughs with two horses driven by the ploughman, are distinguishing characteristics of Scotch, as compared with English agriculture.

Land property in Scotland, as compared with its extent and value, is in fewer hands than in England, there being probably not more than 8,000 proprietors in the whole country.

It is most subdivided in the counties of the West, Mid-Lothian, Renfrew, and Kirkcudbright; but even in these there are many large estates; and in most other parts of the country the greater portion by far of the land is divided into very large estates, many of which have been held, down to 1848, under a system of strict perpetual entail: but this system having been found to be productive of various inconveniences, it was superseded in the above-mentioned counties by the stat. 11 & 12 Vict. c. 36., which abolished perpetuities, and placed the Scotch law of entail nearly on the same footing as the English. But the former tenure was not, in its practical influence, so prejudicial to agriculture as might, *a priori*, have been anticipated.

This results from the circumstance of the courts of law having decided that it was not to let lands belonging to an entailed estate either for an unusually long period, or for less than 21 years (*Scottish grassums*); so that, in truth, there has been little or no difference between the conditions under which entailed and unentailed estates have been occupied: and as the proprietors of the former have been empowered to alienate the estates, proportionally to their value, with sums laid out on necessary improvements and buildings, they are, speaking generally, in as good order, and as productive as unentailed ones.

Estates are of all sizes; varying from 50 to 500 acres and upwards in the improved tillage districts,

population of the counties marked thus, decreased between 1841 and 1851.

tracts, and from 500 to 5,000 acres and upwards in the hilly and mountainous tracts. Except in a few of the sequestered glens of the Highlands, into which the improved systems have not been introduced, the division of the land is nowhere carried to such an extent as to be prejudicial to agriculture; and, in most parts of the country, farms have been gradually consolidating and increasing in size since the American war. At an average of the kingdom, arable farms may vary from 150 to 300 acres; and pasture farms from 500 to 5,000 acres.

Down to the close of the American war, the farm buildings in most parts of Scotland were mean and inadequate in the extreme. In the Lothians they were commonly ranged in a row, having the dwelling-house in the middle, with a barn at the one end, and cattle-houses at the other. In other parts, they were frequently huddled together without any sort of order. The walls were always low, in most instances of stone and clay, the roof being invariably thatch. The dunghill was universally opposite to the door; and so near it, that in wet weather it was no easy matter to get into the house with dry feet. The change that has taken place in these respects during the last half century has been signal and complete. In none but the least accessible and least improved districts are any of the old houses now to be met with. Perhaps, indeed, the other extreme has not been sufficiently avoided; buildings having, not unfrequently, been erected that seem to be both larger and more expensive than necessary. The offices are mostly constructed in the form of a square. In some instances, the dwelling-house makes one of its sides; but in the better class of farms it is removed to some distance from the offices. It is generally two stories high, and is well, and sometimes handsomely, fitted up. Both houses and offices are almost always slated. The expense of buildings is uniformly defrayed by the landlord; but the tenant, for whose accommodation they are in the first instance erected, sometimes pays a percentage upon the money laid out upon them. Sometimes, also, the tenants undertake to carry the materials used in building.

The fences in many parts of Scotland consist of dry stone walls; which, though destitute of X x

beauty, make, when properly built, a capital fence. This species of inclosure seems to have originated in the S. W. Kirkcudbright and Wigtown were early subdivided with excellent stone dykes, that are now celebrated all over the kingdom by the name of "Galloway dykes." They are of very various heights, and degrees of goodness; but the best are built double to a certain height, when they are capped with broad flat stones projecting a little on each side, over which others are usually laid single; but sometimes those laid over the cap-stone are made to lock firmly together. The best dykes vary from $5\frac{1}{2}$ to 6 ft. in height; and, when they have been carefully founded, well built, and constructed of good stones, they make a most excellent and a very durable fence. Examples are not rare of their standing for 60 or 70 years without receiving almost any repair. In a few instances they have been found at above 100 years of age, in a state of perfect preservation! But unless they be of superior material and workmanship, they seldom last more than from 25 to 30 years. Most of the dry stone walls now to be met with all over Scotland have been built, sometimes with more, sometimes with less success, after the Galloway model.*

In respect of farming implements, Scotland has very much the advantage over England. The improved Scotch plough is everywhere met with in the agricultural districts, and is uniformly drawn by two horses, driven by the ploughman. Iron harrows are common. Thrashing-machines are introduced far more extensively than in England; and there is hardly, indeed, a considerable farm in any part of the country without one. The Scotch labourers have never been so absurd as to attempt to advance their interests by destroying those valuable engines.

During the last 20 years, and especially since 1846, improvements of all sorts have been prosecuted in Scotland with extraordinary spirit and success. Drainage has been the grand object of attention: and in some extensive districts it has been carried to such an extent as to have effected a material change in the climate as well as in the soil and appearance of the country, accelerating the period of harvest by two or three weeks! Farms that were formerly wet, late, and suitable only for oats, are now, by the aid of furrow-draining and subsoil-ploughing, made thoroughly dry, early, and suitable for turnips, and for every variety of corn crop. Guano, bones, and other manures are now, also, very largely imported; and these, with the increased quantity and efficacy of farm manure, arising from the improved methods of preserving and applying the latter, have added prodigiously to the productiveness of the land, and to the weight and quality of its produce.

Scotland may be divided into three agricultural districts:—Of these the first, or most southerly, extending from the English border to the rivers Forth and Clyde, contains a large extent of mountainous and pasture land. But extensive tracts in Berwickshire and the Lothians, on the E. coast, are naturally fertile, and are farmed with a degree of skill, economy, and success, unequalled almost in any other part of the empire. There are also large tracts of fertile and well-farmed land in Lanark, Renfrew, Ayrshire, Galloway, and Dumfries; but the climate on the W. coast is not so favourable, and agriculture is not so far advanced on that side the island as on the E. The second agricultural division

stretches from the Forth and Clyde to the great chain of lakes connected by the Caledonian Canal, that runs from Inverness to the Island of Mull. The mountains in this division are on a grander scale than in the southern division; and the proportion of waste land much greater. It, however, contains some of the finest land in the empire. The carse of Gowrie, stretching from Perth to Dundee, consists of the richest alluvial soil; but its agriculture, though good, is not equal to that of some other districts. Strathern, lying to the W. of Perth, is also very fertile. Most part of the extensive county of Fife is arable, and is, in general, highly improved. There are also very large tracts of fine land in Forfarshire and Angus, and smaller portions in Aberdeenshire and Moray. The third division of Scotland, or that which embraces the country lying to the N. of the Caledonian Canal and the lakes, is, with the exception of the eastern parts of Ross-shire, and a few patches beside, wild and mountainous. Black cattle, sheep, and wool, are its principal products.

Except in the S. E. counties, oats are grown in far greater quantities than any other kind of grain; and, from more attention being paid to their culture, or the greater suitableness of the climate, or both, the produce is greater than in England, varying from 30 up to 75 bushels an acre, and even more. Oatmeal, which, till a late period, formed, in cakes and porridge, the principal part of the food of the great bulk of the people, is still in very extensive demand; but, latterly, the use of wheaten bread has become very general in the rural districts, as well as in the towns. Turnips and potatoes are cultivated throughout most part of the Lowlands. The raising of the former is, perhaps, nowhere so well conducted as in E. Lothian and Berwickshire; and their culture in all parts, but especially in the W. coa., has increased with extraordinary rapidity during the last 20 years. Potatoes have of late been grown in large quantities in some of the E. cos. for the London market; and they form, we are sorry to say, an important article of food in most parts of the country; but their cultivation, and the grower's dependence on them, have both been lessened by the recent failures of the crop. The practice of taking two white crops in succession has been almost wholly abandoned in the Lowlands.

Dairy husbandry is mostly pursued in the shires of Ayr and Renfrew, in the former of which Dunlop cheese is made; but it is also introduced into Wigtown and other cos. Cows of the genuine Ayrshire breed are admirable milkers, and the average quantity of butter produced by each has been estimated at upwards of 250 lbs. a year. The Galloway, Fifehire, and Highland breeds are the best for fattening, and yield, especially the first and last, excellent beef. The Galloway cattle are mostly sent up half fed, to be fattened in Norfolk and Suffolk for the London markets. Three principal breeds of sheep are reared in Scotland: the dun-faced, or Scandinavian breed, said to have been imported into Scotland from Denmark, of which a few are found in the cos. N. of the Frith of Tay; the black-faced, or heath breed, very widely diffused, and very hardy; and the Cheviots, the famous breed native to the Cheviot hills. The latter are found to thrive in districts that were formerly supposed to be suitable only for the black-faced breed, and have already, to a considerable extent, superseded the latter; the carcase and fleece being both much more valuable. More recently an improved cross breed, between the Cheviot ewe and the Leicester ram, has been

* There is an excellent account of the Galloway dykes, with judicious remarks on their construction, in *Smith's Survey of Galloway*, pp. 80—93.

nsively and advantageously introduced in the pastures of the S. coe.

Quantity and Value of Agricultural Produce.—These subjects as to which there is but little information on it would be safe to place much reliance. In the statistical tables in the *General Report of Scotland* (III. ind. p. 5.), the arable land is estimated at 5,043,450 sh acres: of these the portion in grass is estimated at 2,489,725; leaving 2,553,725 in tillage, which is said to be distributed as follows:—

	Acres.		Acres.
-	140,095	Potatoes	80,100
-	280,193	Turnips	407,123
-	1,280,352	Flax	16,300
-	500	Gardens	32,000
and peas	118,000	Fallow	218,000

a great extent of waste land has been brought cultivation during the last 30 years; and we are satisfied, from the greatly increased consumption of bread in Scotland, and other circumstances, that quantity of land assigned to the growth of wheat has increased both absolutely and relatively. In our of the matter, the extent and distribution of the land may be set down as follows:—

	Acres.		Acres.
-	350,000	Flax	20,000
-	450,000	Gardens	35,000
-	1,300,000	Fallow	100,000
and peas	50,000		
-	200,000	Total	3,405,000
-	450,000		
-	450,000		

making this distribution to be nearly correct, the quantity and value of the crops may be estimated as follows:—

Crops.	Acres.	Produce per Acre.	Total Produce after deducting 1-7th for Seed.	Price per Quarter.	Total Value.
-	350,000	3½ qrs.	1,050,000	4s.	2,362,500
-	450,000	4	1,542,857	25	1,928,571
-	1,300,000	5	5,571,429	20	5,571,429
and peas	50,000	3	128,572	30	192,858
-	200,000				
-	450,000	7l.	-	-	7,700,000
-	450,000				
-	20,000	8l.	-	-	160,000
-	35,000	15s.	-	-	625,000
Total	3,405,000	-	8,292,858	-	18,440,358

ing the extent of pasture land and wood land in Scotland, exclusive of heaths, wastes, &c., at 2,500,000 and estimating its produce to be worth, at an average of 3s. per acre, its total value will be 7,500,000s., but as to be added the value of about 13,000,000 acres of upland pastures, heaths, and waste land, which has been estimated, apparently with great moderation, at 500,000s. Hence the total value of the land produce of Scotland will be—

Value of crops and gardens	18,440,358
— pasture and wood land	7,500,000
— uncultivated land and wastes	1,500,000
Total	27,440,358

extent of land in Scotland, as ascertained by the valuers under the old property tax, amounted, in 1828, to 5,278,685s. And it appears from the return preferred to (see art. BRITISH EMPIRE, I. 456.), that the landed rental of Scotland, instead of declining, as had supposed, increased in the interval; and amounted, in 1842-43, to 5,586,528s., since which it has not certainly decreased.

difficult to decide upon the portion of the gross rental which should be set apart as the rent of the uncultivated land; but there are good grounds for thinking that it does not exceed leaving nearly 5,000,000s. as the nett rent of the uncultivated land, being at the rate of about 16s. 8d. per acre. There are some considerable exceptions, there is no manner of doubt that, speaking generally, the land of England is superior to that of Scotland; in consequence of the greater skill and economy of the farmers in the latter, and of the advantage they enjoy in the possession of leases, and the absence of tithes and taxes, they are able to pay decidedly higher rents for land of equal fertility. The rent of corn land in Scotland varies from 7s. to 3l. an acre, and occasionally amounts to 5l. and 6l. The best pasture land rarely exceeds more than 3l. per acre; and that which is of a quality may vary from 10s. to 25s.

It differs from that in the estimate, Vol. I. p. 456.: but it is the more accurate.

Rise of Rent.—Rent has increased much more rapidly in Scotland than in England. This is ascribable partly to the extremely backward state of Scotch agriculture till after the peace of Paris, in 1763, and partly to the extraordinary advance it has made since the close of the American war. The entire rental of the kingdom is not supposed to have exceeded 1,000,000s. or 1,200,000s. in 1770. In 1795 it is believed to have rather exceeded 2,000,000s.; and since then it has nearly trebled! So rapid an increase of rent is probably unmatched in any old settled country, and indicates an astonishing degree of improvement.

Condition of Occupiers and Labourers.—We are happy also to have to state, that the wealth of the farmers, and the comfort and well-being of the agricultural labourers, have increased in quite as great a proportion as the rents of the landlords. We have already noticed the extraordinary improvement that has taken place in farm-houses and offices since the close of the American war, and especially during the present century; and the same improvement is everywhere visible in farming stock and implements; in the furniture and other accommodations of the farm-houses; and in the dress and mode of life of their occupants. We have, indeed, no hesitation in affirming, that no old settled country, of which we have any authentic accounts, ever made half the progress in civilisation and the accumulation of wealth, that Scotland has done since 1763, and especially since 1787.

Some very great improvements have, as already seen, been introduced into agriculture within these few years, and are now rapidly spreading over the country. The facilities afforded by steam navigation for the conveyance of fat cattle and sheep to the great markets of London and Liverpool, as well as to those of Edinburgh and Glasgow, have also been of vast importance, and have enabled the remotest districts to come into successful competition with those that are most favourably situated. In consequence, agriculture is at this moment in a rapid state of advancement. And, notwithstanding the fall of prices, farms let better now (March, 1851,) than at any former period, and the fair presumption seems to be that, great as has been the improvement of agriculture during the last half century, it will be equal or greater during that on which we are now entering.

One of the things that seems most likely to defeat this presumption, or to retard the future progress of agriculture, is the fact of the Reform Act having conferred the elective franchise on all occupiers of lands worth 50s. a year and upwards. This has been in every respect a pernicious, ill-advised measure. Formerly the landlords rarely inquired as to the politics of their tenants; and provided they paid them their rents, and managed their lands according to the stipulations in their leases, they might be of any political or religious party they pleased. But now it is altogether different. The landlords, desirous, like other people, of extending their political influence, endeavour to control, or rather command, the suffrages of their tenants, and to multiply the dependent voters on their estates. In furtherance of these objects, they have not scrupled, in many instances, to resort to intimidation, and to adopt vindictive measures against such of their tenants as have voted contrary to their wishes. This, however, though the most prominent at the time, is but the least evil resulting from the new state of things. It has already led in many instances to a change in the mode of letting land; and there is but too much reason to fear that it may, in the end, subvert that system of giving leases for 19 or 20 years certain that has been a main cause of the astonishing improvement of agriculture. It has also occasioned, in many instances, a subdivision of farms for the mere purpose of creating voters; and there cannot, indeed, be a question that, however well intended, the conferring the elective franchise on the tenants has been one of the greatest blows ever struck at their independence, and at the prosperity of agriculture. Nor is there anything in this but what might have been, and in fact was, anticipated from the outset. Tenants, as such, whether they hold farms worth 50s. or 500s. a year, are about the very last description of persons to whom the franchise should be

conceded. Very many of them are indebted to, and dependent, to a greater or less extent, on their landlords; and the few who are independent are so because they have accumulated property, and would, in consequence, have been entitled to the franchise, had it been conferred, as it should have been, on those only who possessed a certain amount of realised property. If that be, as it unquestionably is, the best system of voting that brings the greatest number of independent electors to the poll, and keeps back the greatest number of those that are dependent, the giving the franchise to the tenants and occupiers of land must be about the very worst system, for they are, of all classes, that which is most dependent, and most at the mercy of others.

The condition of the agricultural labourer has, also, as already stated, been vastly improved. With the exception of those districts in the Highlands and Isles, luckily few in number, into which improvements have not yet made their way, the cottages of the peasantry have been mostly rebuilt during the last half century; and though still, in most instances, without the rustic beauty and neatness that so frequently distinguish English cottages, they are far from uncomfortable. In most parts of the country such of the farm-labourers as are married, and have families, receive the greater part of their wages in specific quantities of farm produce, which do not vary with the variations of price; so that, if they be not so well off as the manufacturing work-people, when trade is brisk and prices low, neither are they exposed to suffer like the others, when there is little demand for labour, and prices are high: on the whole, they may, speaking generally, be said to be in decidedly comfortable circumstances. The unmarried servants frequently live in the farm-house. They are almost all excellent ploughmen; all of them are able to read and write; and their sons not unfrequently emerge from obscurity, and attain to distinction.*

Manufactures. — For a lengthened period after the union with England, Scotland made little or no progress in manufactures; and it was not till after the peace of Paris, in 1763, that the public enterprise began to be turned into this great channel, and that a rapid extension took place of most sorts of industry. A considerable depression ensued towards the close, and after the termination of the American war. But it was not of any very lengthened duration; and the foundations of the cotton trade having been laid about this period, manufactures have continued, from 1787 down to the present time, progressively to gain ground in Scotland, and have been prosecuted with equal skill, industry, and success.

Account of the Numbers of Cotton, Woollen, Worsted, Flax, and Silk Factories in Scotland in 1850; specifying the Numbers of Spindles, Power-Looms, and Hands in each Business. (*Parl. Paper*, No. 745. sess. 1850.)

	No. of Factories.	No. of Spindles.	No. of Power Looms.	No. of Hands.
Cotton	168	1,683,093	23,564	36,325
Woollen	182	224,129	247	9,464
Worsted	6	9,404	-	746
Flax	189	303,125	2,529	28,312
Silk	5	36,652	-	841
Total	550	2,256,403	26,340	75,688

Of the hands employed, 22,140 were males, and 53,548 females; 1,120 children were employed under 13 years of age.

In 1850, there were in Scotland 26,340 power-looms, of which 23,564 were employed in weaving cotton fabrics. And exclusive of power-looms there were, in the S. division of Scotland, in 1838, about 51,060 hand-looms for various fabrics, employing, as was estimated, about half that number of families. The cotton manufacture, which principally centres in Lanark and Renfrew shires, is of comparatively recent introduction, the first steam-engine for a cotton factory having been constructed so late as 1792.

* The reader who may wish to become more particularly acquainted with the extraordinary changes that have taken place in the agriculture and mode of life of the people of Scotland since 1760, would do well to consult *Robertson's Rural Recollections*. It is at once an authentic, interesting, and instructive work.

But the woollen manufacture has been of long standing, and was formerly much more widely diffused than at present, having been, in fact, with that of linen, a domestic manufacture, and pursued in every cottage. It was the universal practice of the peasantry, and occupiers of land, to spin, at home, the greater part of their own wool, as a subsidiary employment, and to send the yarn to be made into coarse cloth in the nearest village.

There is still a class in Scotland called *customer weavers*, scattered over the country, but now principally confined to the Highlands, employed by private families to weave yarn into coarse fabrics for domestic use. Most part of these are also agricultural labourers, weaving only in the intervals of their ordinary avocations; they earn from 1s. to 2s. 6d. a day, but few higher than 1s. 9d. But except these, and persons living at watering-places, and on parts of the E. coast, where they engage in fishing or boat-letting for a part of the year, the great bulk of the weavers of Scotland subsist entirely by the loom, and engage in no other pursuits. (*Symons in Hand-loom Weavers' Rep.*, p. 5.)

At present, and for some time past, this class has been in very depressed circumstances. Owing to the facility with which the business of weaving may be learned, and the sort of independence it confers on the weaver, it has always been a favourite employment; and, consequently, except in periods of great prosperity, the wages of weavers have generally been rather low. Of late years, however, the introduction of power-looms has gone far to supersede, to a great extent, the business of the regular hand-loom weaver, especially of those engaged in the manufacture of cottons; and the fair presumption seems to be, that in no very lengthened period the business of the hand-loom weavers will be all but totally annihilated. But though there can be no doubt that, in a public point of view, this change will be productive of great advantage, it involves, in the meantime, the class of hand-loom weavers in the greatest difficulties; and, in point of fact, much of that manufacturing distress of which we frequently hear proceeds from hand-loom weavers thrown out of employment by the competition of power-looms, or forced to labour for the merest pittance. That such persons are proper objects of public sympathy, none can doubt; and everything that is practicable should be done to facilitate their employment in other businesses, or their emigration to the colonies. Till such time as this transference has been effected, there will be the same unvarying, and generally unfounded tale of manufacturing distress.

It appears from the statements given in Burns' account of the cotton manufacture for 1845, that the total quantity of cotton spun in England during that year amounted to 467,029,465 lbs., and that spun in Scotland to 27,737,022 lbs. Now, taking the entire value of the manufacture at 35,000,000*l.*, and supposing it to be proportioned in both countries to the quantity of yarn spun in each, that would give about 2,000,000*l.* for the value of the portion belonging to Scotland. We believe, however, that the quantity of yarn spun in Scotland is underrated nearly a half in this statement, and that the value of the cotton goods annually produced in Scotland may be estimated at about 5,000,000*l.* A large proportion of the Scotch manufactured articles consist of the finer descriptions of muslins and other superior and costly fabrics, which makes their aggregate value exceed what might be inferred

the comparative amount of yarn produced in Scotland.

Compared with the woollen manufacture of England, that of Scotland is inconsiderable. Hosiery, shawls, plaids, stockings and fine yarn, tartans, carpets, druggets, &c. are made to a considerable extent at Galashiels, Hawick, Jedburgh, and Aberdeen. Some of the finer descriptions of cloth are made in Aberdeen and in its vicinity, and some of its linen mills and factories are on a large scale. Dundee is the seat of a very extensive and flourishing carpet manufacture. The power-loom, having hitherto been but little adopted in the woollen manufacture, the weavers employed in this department get good wages, are well fed and lodged, and in all respects exhibit a marked contrast with the hand-loom weavers engaged in the cotton manufacture.

The linen manufacture of Scotland is of very considerable value and importance: Dundee is the chief seat; and the statements previously given (see art. DUNDEE, Vol. I.) show that its increase since 1811 has been quite extraordinary. Linen, sheeting, cotton bagging, sail-cloth, dowlas, and other coarse goods, are the articles principally made in Dundee and in Inverness, Arbroath, Forfar, Montrose, Aberdeen, and other seats of the manufacture in the north of Scotland. The finer descriptions of linens, as damasks, dispers, shirtings, &c., are principally produced in Dunfermline and its immediate vicinity. Power-looms have not hitherto been extensively employed in this department, only 2,529 having been introduced into it in 1850. At present it is supposed to employ about 17,000 hand-looms in summer, and from 20 to 23,000 in winter. The linen weavers occupy an intermediate position between the cotton weavers on the one hand, and the cotton weavers on the other. The silk manufacture is of little importance. The printing of shawls, &c., is usually carried on at Paisley (which see, ante, p. 5.)

The iron-works at Carron, near Falkirk, established in 1759, were for a lengthened period the most extensive in the kingdom; but they are now far surpassed by those at Glasgow, Dundee, Monkland, &c., in Scotland, and by many in England. A good deal of Scotch ironwork, comprising anchors, bolts, axles, mill and engine-work, &c., is exported to the colonies and foreign countries. The manufacture of machinery is an important branch of industry. Coach-making is carried on in the large towns, and ship-building in many of the ports. Glass wares, chemical products, soap, candles, tallow, are among the other principal manufactured articles.

The favourite beverage of the people of Scotland has, for a lengthened period, been whiskey, a spirit generally distilled from malt or raw grain. Owing to the excessive duties with which this spirit has occasionally been taxed, its smuggling has sometimes been carried to a great extent; but since 1826 and 1830, when the duties were reduced from 5s. 10d. to 2s. 10d. and 2s. 4d. per imperial gallon, clandestine distillation and smuggling have been comparatively rare. We subjoin an

Abstract of the Quantities of British Spirits entered for Consumption in Scotland, with the Rates of Duty thereon, and the Amount of Duty in each Year from 1830 to 1850. [See top of next column.]

Summary.—Having little industry, and being thinly settled, Scotland had formerly a very limited foreign trade.

The exports consisted of wool, skins, hides, and raw materials, exchanged for corn, wine, spices, &c. so late as the era of Cromwell her mercantile marine consisted only of 98 vessels, of the aggregate burden of 2,734 tons and 10 barks. During the reign of Charles II. the trade of the country, especially that with Holland and the countries round the Baltic, began to increase. It was not, however, till after the completion of the Union, in 1707, when the trade to the American and W. Indian Seas was, for the first time, opened to the enterprise and activity of the Scotch, that the commercial energies of the nation began to be awakened. But for a while

Income-tax was at its height, it amounted to 4,394,097l.; and in 1839, notwithstanding the repeal of the income-tax, and of a great number of other taxes, the gross revenue of Scotland amounted to 5,254,834l., and the net revenue to 4,932,460l.—a rate of increase wholly unexampled in either of the other divisions of the United Kingdom. We subjoin an

Account of the Gross and Nett Produce of the Revenue of Scotland in 1849.

	Gross Produce.			Nett Produce.		
	£	s.	d.	£	s.	d.
Customs	1,934,391	8	10	1,919,028	9	11

Total	6,277,375	8	2	5,016,754	7	0

Currency.—The currency of Scotland has, for a lengthened period, principally consisted of the notes of the different banking companies. These, for the most part,

are joint-stock associations, with numerous bodies of partners, and have been managed with great skill and discretion.

Very few bankruptcies have occurred among the Scotch banks; and they have, no doubt, contributed materially to forward the improvement of the country by the facilities they have afforded to industrious and deserving individuals of obtaining loans; and still more by the practice, which has long been acted upon, of taking very small sums in deposit, and allowing interest upon them at about 1 per cent. below the market rate at the time. This has brought, as it were, a number of substantial and well-organised savings' banks within reach of all classes; and by furnishing every facility for the safe and profitable custody of the smallest and largest sums, has powerfully stimulated the desire to save and amass. The deposits in the Scotch banks are supposed to amount, at this moment, to about 30 millions sterling; and we believe it may be safely affirmed, that, but for the facilities that have been afforded for the accumulation of the smaller class of sums, at least 15,000,000l. of this amount never would have existed. The notes of the Scotch banks in circulation amount, at an average, to about 3 millions.

An Account of the Scotch Banks empowered to issue Notes, specifying the Maximum authorised issue of each under the 8 & 9 Vict. c. 36., with other Particulars.

Names of Banks.	Head Office.	When Established.	Branches and Sub-branches.	Number of Partners.	Capital authorised.	Circulation authorised by 8 & 9 Vict. c. 36.

	Total		300	14,380	12,107,100	2,606,700

Roads.—With the exception of the military roads, constructed in the Highlands after the suppression of the rebellion, in 1746, the roads of Scotland were, speaking generally, in the most execrable state down to the American war. But such and so great has been the improvement in the interval, that they are now quite equal to the best roads in England, and are not, indeed, surpassed by any in Europe. They are laid down on the most approved principles; and, notwithstanding the rugged nature of the country, it is but seldom that horses in a carriage may not be driven along at a smart trot. The facility with which excellent materials for their construction may almost everywhere be obtained has materially contributed to forward their formation. The roads within what is called the Highland district have been partly constructed by means of advances from government, and the public money has very rarely been so profitably expended.

Railways.—Scotland is intersected with railways to an extent which, considering the rugged nature of the country, could hardly have been anticipated. There are no fewer than 2 lines of railway from England to Scotland, viz. the E. line, by Newcastle, Berwick, and Dundee; the central or Caledonian line, by Carlisle, Ecclefechan, and Lanark; and the W. line by Carlisle, Dumfries, Sanquhar, and Kilmarnock. Edinburgh and Glasgow are united by a railway; as are Edinburgh, Dundee, and Aberdeen, by Ferry Port-on-Craig, and by Perth; Glasgow, Stirling, Perth, Dundee, &c.; Glasgow, Greenock, Ayr, &c. The facilities of intercourse that have thus been afforded are quite extraordinary. The journey from Edinburgh to Glasgow, which, about a century ago, took a stage coach 26 hours to perform, is now performed in 14 or 9 hours. And the journey from Edinburgh to London, which, so late as the era of the American war, took about a week for its completion, and which, at a much more recent period, was both tedious and fatiguing, is now performed with the utmost ease in 12 or 13 hours!

The difficulties that have been overcome, and the expenses that have been incurred (sometimes needlessly), in the construction of some of these lines, have been quite astonishing. And it may be doubted whether some of them will ever turn out to be profitable undertakings for the original subscribers. But it is impossible to predicate the degree to which they may benefit

by the continuance of those public improvements which they have done so much to facilitate.

Canals.—Of the Scotch canals, the most important by far is that called the Great Canal, uniting the Firths of Forth and Clyde, and, consequently, forming an easy water communication between the E. and W. coasts of the island. Including its branch to port Dundee, in the vicinity of Glasgow, it is about 36 m. in length, the medium width at the surface is 56 ft., and at the bottom 27 ft.; average depth, from 9 ft. to 10 ft.; summit level, 156 ft. above the sea; it has 20 locks. This important work was begun in 1763, but was not finally completed till 1790. It has been as profitable to the shareholders as it is advantageous to the public.

The Union Canal joins the Forth and Clyde Canal, near Falkirk, and stretches thence to Edinburgh, being about 31½ m. in length. It was completed in 1822, but has been, in all respects, a most unprofitable undertaking. Hitherto, the proprietors have not received any dividend, and their prospects, we understand, are but little, if any thing, improved.

There are other canals in the vicinity of Glasgow; the Crinan Canal stretches across the Mts. of Cantire; and there is also a canal in Aberdeenshire. But the greatest work of this class in Scotland, or, perhaps, in the empire, is the Caledonian Canal. It stretches quite across the island, through the centre of the Highlands, N.E. and S.W., from the Banally Frith on the E. coast to Loch Linnhe on the W. It is chiefly formed by the chain of lakes, including Loch Ness, Loch Oich, and Loch Lochy, which occupy the bottom of the remarkable glen or depression through which it is carried. Its total length, including the lakes, is 30½ m.; but the artificial or excavated part is only 31½ m. At the summit it is only 94½ ft. above the level of the W. Ocean.

It is mostly constructed upon a very grand scale, being intended to be 30 ft. deep, 30 ft. wide at bottom, and 120 ft. at top; the locks are 30 ft. deep, 170 in length, and 40 in breadth; and had it been wholly executed as was originally intended, frigates of 22 guns, and merchant-ships of 1,000 tons' burden, might have passed through it. It was opened in 1822, being executed entirely at the expense of government, from the designs and under the superintendence of Thomas Telford, Esq. The entire cost has exceeded a million sterling. There can, however, be no doubt that it was projected with due con-

sideration, and may be regarded as about the least advantageous public work that has been undertaken for a lengthened period. During the year 1836-37, the total revenue of the canal, arising from tonnage dues and all other resources, amounted to only 2,279*l.*, while the ordinary expenditure during the same year amounted to 3,907*l.*; and it has increased little, if any thing, in the interim. But this is not all. Owing to a wish to lessen the expense, and to hasten the opening of the canal, parts of it were not excavated to nearly their proper depth, while others were executed in a hurried and insufficient manner. Hence the canal does not really admit vessels of above 250 or 300 tons' burden; and, but for the employment of steam tugs on the lakes, which were not heard of when the work was undertaken, vessels might have been 6 weeks in making their passage from sea to sea. And even with the assistance of tugs it is but little resorted to. Under these circumstances, and considering the risk of its breaking through its banks and overflowing parts of the adjacent country, we need not be surprised to find that it has been gravely debated whether it would not be better entirely to fill up and abandon the canal!

The constitution of Scotland has been, from the earliest times, what is called a limited monarchy. Originally the parliament, or great council of the nation, consisted of the king, the barons, and the principal ecclesiastics. Burgesses, or representatives for the towns, were admitted into the Scotch parliament by Robert Bruce, in 1326; and in 1427 the lesser barons or freeholders in the different counties, were authorised to send representatives; but so little was this privilege valued, that it was hardly exercised for 160 years, or till the reign of James VI., when the freeholders were compelled to send representatives.

Scotland, however, derived little or no benefit from her parliament. The nobility, or greater barons, and clergy sat and voted in the same chamber with the representatives of the lesser barons and of the towns; so that, even if the latter had been more powerful and independent than they were, they could have made no effectual opposition to any measure patronised by the nobles and clergy. In point of fact, however, the representatives of the counties were mere nominees of the great lords; and the towns having neither wealth, population nor importance, their representatives were necessarily as impotent as themselves. The nobility and clergy were, in truth, for a lengthened period, everything, and the people nothing.

Even had it been, in other respects, better constituted, the institution of the Lords of the Articles would have rendered the parliament of Scotland good for nothing as a check on the sovereign. This was a committee, consisting of a few members, chosen either directly or indirectly by the crown, to which all matters to be brought before parliament had, in the first instance, to be referred; and which had power to reject such as it disapproved of, and to modify and alter the others in any way it thought proper. This committee had, therefore, a negative before debate; and the whole duty of parliament was confined to meeting for a day or two at the end of the session, to confirm the proceedings of the Lords of the Articles! With such an instrument at their command, we need not wonder at the preponderating influence possessed by the sovereigns of the Scotch parliaments; and had their ability to carry laws into effect been, in any respect, equal to the facility with which they could get them passed, the kings of Scotland would have been the most, instead of the least, powerful of European princes.

The Committee of the Lords of the Articles was suppressed at the Revolution; but owing to defects in the mode of choosing representatives, the constitution of parliament was but

little improved by its suppression; and down to the passing of the Reform Act, in 1832, Scotland had the shadow merely, without the substance — the disadvantages without any of the advantages — of a representative government. Happily, however, its representative system is now placed nearly on the same footing as that of England. (For further details, see Vol. I. p. 467. and p. 777.)

According to the Articles of Union in 1707, the peerage of Scotland is represented in the House of Lords of the United Kingdom by 16 peers, chosen by the whole body of Scotch peers at the commencement of each parliament: it was then also arranged that the coo. of Scotland should be represented in the H. of C. by 30, and the boro. by 15 mems. This arrangement was continued till 1832, when the borough representation received an addition of 8 mems., the mems. for the coo. continuing as before.

Courts of Law. — The Court of Session, which was constituted by an act of the Scottish parliament in 1537, is the highest civil court of Scotland, having jurisdiction in all civil questions of whatever nature. It was intended to supply the place of the previously existing courts, and more especially of a judicial committee of parliament called the "lords of session," whence the name of the court and the titles of the judges. Originally it consisted of 7 laymen and 8 churchmen, including the president. In 1640, however, an act was passed, providing for the exclusion of churchmen from the court; and, though repealed in 1661, the principle laid down in it has ever since been acted upon. Other important improvements were introduced at different periods, particularly after the Revolution, when the right of appeal from the court to parliament was, for the first time, recognised. At the Union power was given to all individuals who considered themselves aggrieved by judgments of the Court of Session to appeal to the H. of Lords; and it is a curious fact, that, at this moment, and for a lengthened period, the principal judicial business of the H. of Lords has consisted in hearing and deciding Scotch appeals. Originally, and down to 1808, the whole 15 judges sat together in one court; but in that year an act was passed dividing the court into two chambers, the lord president presiding in the first division of 7 judges, and the lord justice-clerk in the second, of 6; the 2 remaining judges trying cases in the first instance, or, as it is technically termed, sitting as lords-ordinary. Since then the number of judges has been reduced to 13; 4 belonging to each of the divisions, and 5 acting as lords-ordinary, or sitting as single judges. The judges were at first chosen by the Scotch parliament; but since 1554 they have been appointed by the crown. They are indifferently styled lords of session, or senators of the College of Justice, which last embraces the whole body of barristers (advocates), and attorneys or solicitors who practise before the court. They must be 25 years of age; and, by the treaty of union, no person can be named to the office unless he have served as an advocate or principal clerk of session for five years, or as a writer to the signet for ten. The salaries of the ordinary judges have been raised to 3,000*l.* a year each; those of the lord justice-clerk, and lord president, being, respectively, 4,000*l.* and 4,500*l.*

At its outset the court of session was intended to serve as a standing or perpetual jury for the trial of cases; the introduction of petty juries into the trial of civil cases in Scotland being

only of very recent date, as well as of limited application. It was, in fact, unknown till 1815, when a special or jury court was instituted, for the trial of cases involving questions as to the value of property, the amount of damages, or

the determination of some fact. But in 1830 this court was suppressed; and the court of session now avails itself of the assistance of petty juries in the trial of the above description of cases.

Account of the Causes brought before the Outer and Inner Divisions of the Court of Session, and of the Judgments on the same in each Year from 1834 to 1849, both inclusive.

Year.	Outer House.			Inner House.

1849	1,680	586	681	386	1,123	293	27

The High Court of Justiciary was remodelled, and placed nearly on its present footing, in 1672. It consists of five judges of the court of session, specially commissioned by the sovereign, together with the justice-general and justice-clerk; the former, or in his absence, the latter, being president. In 1836, the office of lord justice-general was conjoined with that of lord president of the court of session. The jurisdiction of this court extends to all criminal cases, except those of high treason, which are tried by a special commission, in the English form, on the finding of a *grand jury*, which is not used in other cases in Scotland. The judgments of the court of justiciary are final, no appeal lying from them to the H. of Lords. Circuit or assize courts are held twice a year, by the judges of this court, in the principal towns of Scotland, two judges usually going on each circuit; and an additional circuit-court is held at Glasgow during the Christmas holidays. The circuit-courts have power to decide in appeals from inferior courts, where the subject in dispute does not exceed 25*l*. Cases brought before the justiciary court are tried by petty juries of 15 persons, who decide by a plurality of votes, not being compelled, as in England, to give unanimous verdicts. It is not going too far to say, that, down to a very recent period, this was, in as far as respects political cases, one of the most corrupt and worthless tribunals in Europe. Owing, as has been previously stated (see Vol. I. 469.), to the mode in which juries were selected, it was always in the power of the lord advocate, or public prosecutor, to get a jury appointed favourable to his own views; and the judges, having been appointed by the crown, and looking to it, most probably, for farther advancement for themselves or their families, were, with few exceptions, obsequious tools. Hence, in Scotland, to be prosecuted for a political offence was, for a lengthened period, nearly equivalent to being condemned. Luckily, however, this disgraceful state of things has been thoroughly reformed. Juries in Scotland are now fairly selected; the accused has the same right of peremptory challenge as in England; so that, however disposed, the judges can no longer dictate verdicts. The old court of exchequer, commission of teinds, admiralty and consistory courts, are now merged in the court of session.

The inferior courts of law are those of the boroughs, justices of the peace, and sheriffs.

Account of the Number of Persons committed for Trial, tried, &c., in Scotland during each of the 7 Years ending with 1849.

Year.	Committed for Trial, or Bailed.		Tried.	Convicted, Outlawed, or Insane.	Convicted, having been previously Convicted.

1845	2,515	1,022	2,973	2,710	757
1846	2,901	1,168	3,409	2,982	869
1847	3,590	1,315	3,831	3,569	1,044
1848	3,490	1,419	3,975	3,689	1,043
1849	3,228	1,129	3,543	3,280	958

The first are called "bailie" courts, from being presided over by a bailie or alderman, with, in some cases, the assistance of a legal assessor. Their civil jurisdiction within the borough depends on circumstances, being sometimes nearly equivalent to that of sheriffs in coa.; but their criminal jurisdiction extends only to petty riots and common police offences. The justices of peace decide without appeal in actions where the demand does not exceed 5*l*. besides costs. They commit criminals and hold petty sessions, at which two are a quorum, and quarter sessions; but have in no instance the power of transportation.

The sheriff courts are very important, and transact most part of the county business. Each co. has a principal sheriff, called a sheriff-depute, from his being deputed or appointed by the crown; who, in addition to duties similar to those devolving upon English sheriffs, has a very extensive civil jurisdiction. He holds office *ad vitam aut culpam*, his salary varying from 300*l*. to 800*l*. a year, according to the supposed onerousness of his duties. In the coa. of Edinburgh and Lanark, the residence of the sheriff-depute is enforced; but in the other coa. he is rarely resident, his presence not being necessary, except on particular occasions. Sheriff-deputes are, in fact, usually practising lawyers in Edinburgh, and the ordinary business of the co. is devolved on the sheriff-substitutes, or deputies of the principal, who are always resident. In extensive coa. there are usually several sheriff-substitutes. This very useful class of judges must be chosen from advocates, writers to the signet, solicitors of the supreme courts, or solicitors of three years' standing before a sheriff court; and, though nominated by the sheriff-depute, they cannot be displaced without the concurrence of the lord president and lord justice-clerk. At present their

aries, which were raised in 1840, vary from £. to 550£. a year, exclusive of fees. The sheriff, his substitute, holds small-debt courts for decision of questions of debt and costs to amount of 8£. 6s. 8d., in which the pleadings all *viva voce*, the expense small, not exceeding 2s. 6d. or 3s., and the judgment final. In ordinary courts, however, the authority of which extend to all personal actions without limit of amount, the pleadings are mostly in writing. Until a comparatively late period the sheriff exercised a criminal jurisdiction, extending in some cases to capital punishment; but his powers, in this respect, are now greatly abridged. He still occasionally tries criminal cases with a jury, but a sentence may be appealed from to the court of justiciary. No sentence, except for petty offences, involving fine, imprisonment, or, at most, punishment from the county or borough, can be pronounced by any legal authority in Scotland without a jury; nor can any person be now imprisoned for any debt under 8£. 6s. 8d.

Religious Establishments. — The Roman Catholic religion, and the jurisdiction of the pope, were abolished in Scotland in 1560; a confession of faith, on Calvinistic principles, drawn up by the celebrated John Knox, was then also agreed to, and the Protestant religion was established by an act of the legislature. Knox, having studied under Calvin at Geneva, introduced the Genevese or Presbyterian form of church government; but, though organised, it did not receive the sanction of the legislature until 1592. After the accession of James VI. to the throne of England, he endeavoured, notwithstanding the strenuous opposition of the great bulk of the nation, to re-establish episcopacy; and a struggle was carried on between the abettors of episcopacy and presbytery, who alternately prevailed, according as the court or popular party happened to have the ascendancy, until the Revolution, when presbytery was definitely established.

Some, however, of the parishes are collegiate, and have two clergymen; and latterly some of the more extensive parishes have been divided, and assistant, or *quoad sacra* ministers have been appointed to them. These are called *quoad sacra* and *quoad spiritualia* ministers because they are not entitled to participate in the civil endowments belonging to the parish, and are wholly supported by a sum granted annually by the sovereign. These *quoad sacra* clergymen were admitted, by an act of the General Assembly of 1733, members of presbyteries, and other church courts. But this act has since been found to be illegal by a judgment of the House of Lords.

At present, and since the reign of Queen Anne (1712), the privilege of appointing clergymen to parishes has been vested in the crown or in private patrons, with the proviso that they must be selected from among those who have gone through the course of study prescribed by the church, and have been examined and licensed as preachers by a presbytery. The right of patronage has long, however, been exceedingly unpopular. Its enforcement, in despite of public opinion, occasioned the great secession from the church in 1843; and latterly it has become more unpopular than ever. The General Assembly, by a measure, called the *veto* act, passed in 1834, gave the congregations belonging to parishes a right to reject a presentee, if he were not acceptable to them: but (unfortunately, as we think,) it was decided by the court of session and subsequently by the H. of Lords (3 May, 1839) that the General Assembly had no power to pass the *veto* act, and

that all proceedings under it were null and void. This decision was not, however, submitted to by the majority of the Assembly, by whom it was regarded as a usurpation upon their rights; and no legislative measure having been proposed calculated to allay the public irritation, or to mitigate the extreme exercise of the right of patronage, the leaders of the dominant party in the Assembly determined to secede from the church. Accordingly on the first day (18 May) of the meeting of the General Assembly of 1843, the ministers and elders, members of that body, opposed to the right of patronage and in favour of the *veto*, gave in a Protest, stating, among other things, that "The courts of the church as now established, and members thereof, are liable to be coerced by the civil courts in the exercise of their spiritual functions; and in particular in their admission to the office of the holy ministry, and the constitution of the pastoral relation, and that they are subject to be compelled to intrude ministers on reclaiming congregations in opposition to the fundamental principles of the church and their views of the Word of God, and to the liberties of Christ's people:" And this protest having been read, the protesters withdrew to a separate place of meeting, and constituted themselves, and such as might afterwards adhere to them, into a body to be denominated the FREE CHURCH OF SCOTLAND. The Protest was signed by 125 ministers and 77 elders. But within a few weeks, no fewer than 470 clergymen seceded from the establishment, and joined the Free Church. Of these, 273 were parish clergymen, being nearly a third part of the total number of those belonging to the establishment. The rest were *quoad sacra* ministers. And whatever may be thought of its wisdom, this proceeding sets in a striking light the sincerity and zeal by which the seceders were animated. The voluntary abandonment by so many individuals of their homes and incomes, rather than hold them by compromising what they believed to be a fundamental principle, reflects the highest credit on the Scottish church and character.

As might be expected, the Free Church embraces a large body of lay adherents. In May, 1845, no fewer than 570 churches had been built for the accommodation of its members; 70 more were, at the same time, in the course of being built; and others were projected. It had then, also, 613 ordained clergymen, and 197 congregations without ministers. Very conflicting estimates have been formed of the total numbers of those within the pale of the Free Church; these being exaggerated by its friends, and underrated by its opponents. On the whole, however, they may perhaps be safely estimated at about 600,000.

Nothing, perhaps, has been so extraordinary, in connexion with the history of this secession, as the zeal and liberality displayed by the public in subscribing funds for the building of churches and the support of the clergy. These amounted, in May, 1845, to no less than 776,453£., of which not 10 per cent. was unpaid. Large additional subscriptions have since been received. During the year ended 30th March, 1850, the sum of 306,622£. 0s. 1½d. was received by the Free Church for its various objects. A handsome college in connexion with the Free Church has been opened in Edinburgh; and houses (manse) for the accommodation of the clergymen have been built in most parts of the country.

But while there is much to applaud in this display of zeal and liberality, we cannot help regarding the late secession as fraught with

many inconveniences, and regret that measures were not taken to prevent its occurrence. We said in the former edition of this work, "It were much to be wished that this question were satisfactorily disposed of. No doubt there are numerous difficulties in the way, but they are far from being insuperable; and we are clear that either the privilege of selecting their clergymen should be given to parishes, or that they should be authorised peremptorily to reject any presentee not acceptable to them. The latter, perhaps, would be the least exceptionable mode of disposing of the question; and it might at once be effected by giving the *veto* act of the General Assembly the force of law. This privilege is, in fact, of the very essence of presbytery. It is entirely a popular institution; and it is idle to suppose that those who are conscientiously attached to it should ever approve a system of absolute patronage. That control over the election of clergymen, for which the majority of the clergy and people of Scotland are now contending, is not only right and proper in itself, but is in keeping with the other institutions of the country. All magistrates of boroughs, members of parliament, and other functionaries, are now chosen by popular election; and we have yet to learn why a different practice should be followed in the case of clergymen; and that they, whether acceptable or not, should be thrust upon the public. Such a system is sure, in the end, to destroy itself. To keep it up can serve no purpose, unless it be to lessen the utility of the church, to occasion agitation, and to add to the number of dissenters."

What has since occurred has fully demonstrated the truth of these statements. Had the *veto* act been passed into a law, the disruption of the church would not have occurred; and we believe we may, also, safely affirm that the *veto* would not have been exercised in one case out of twenty. Patrons would have seen the wisdom of deferring (as many of them do at present) to the wishes of congregations, and the *veto* would rarely have been heard of. Now, however, the established church is no longer the church of a decided majority of the people; and has ceased to enjoy much of the respect and influence that formerly belonged to it. Religious animosities and fanaticism have also been widely diffused; so that, on the whole, there is good cause to regret the not giving a legal effect to the *veto* act of the General Assembly.

A presbytery consists of the clergymen of an indefinite number of contiguous parishes, and of an elder from each kirk session. It has cognizance of all ecclesiastical matters within its limits, examines, licences, or rejects preachers or candidates for the ministry, reviews the decisions of kirk sessions, &c. Originally presbyteries met every week, but now, in general, only once a month. Appeal may be made from their decisions to the synods.

A synod consists of the clergymen of an indefinite number of contiguous presbyteries, with an elder from each of the different kirk sessions. This court, which usually meets twice a year, reviews the decisions of presbyteries; but its own decisions may be reviewed by the General Assembly, the highest ecclesiastical authority in the kingdom. We subjoin

A Statement, exhibiting an Account of the Number of Synods, Presbyteries, Parishes, and Clergymen, belonging to the Church of Scotland.

[See top of next column.]

The Scotch church is a perfect democracy, all the members being equal, none of them having

any power or pre-eminence of any kind over another. There is in each parish a parochial tribunal, called a kirk session, consisting of the minister, who is always resident, and of a greater or smaller number of individuals, of whom, however, there must always be two selected as elders. The principal duty of the latter is to superintend the affairs of the poor, and to assist in visiting the sick. The session interferes in certain cases of scandal, calls parties before it, and inflicts ecclesiastical penalties. But parties who consider themselves aggrieved may appeal from the decisions of the kirk session to the presbytery in which it is situated, the next highest tribunal in the church.

The GENERAL ASSEMBLY, which consists partly of clerical and partly of lay members, chosen by the different parishes, boroughs, and universities, comprises 386 mems., as follows:—

Eighty Presbyteries send, ministers	-	-	-	216		
elders	-	-	-	94		
City of Edinburgh, elders	-	-	-	2		
Sixty-five other royal burghs	-	-	-	65		
University of Edinburgh,	} one minister or one elder each	}	}			
University of Glasgow,						
University of St. Andrew's,						
Marischal College, Aberdeen,						
King's College, Aberdeen,						
Churches in India, a minister and an elder				2		
Total number of members				386		

The General Assembly meets annually in May, and sits for 10 days; but it has power to appoint a commission, with powers equal to its own, to take up and consider any matters it may have left undecided. The Assembly is honoured during its sittings with the presence of a nobleman, the representative of the sovereign, with the title of Lord High Commissioner. He is merely, however, a state appendage, and cannot interfere in any way with its proceedings. All matters brought before the Assembly are decided, after debate, by a vote. Party sometimes runs as high in the Assembly as in the H. of C.; and the discussions are frequently as acrimonious and as eloquent.

The stipends of the Scotch clergy are principally derived from the wreck of the tithes and other property that belonged to the Rom. Cath. church, which was principally seized upon at the Reformation by the nobility and gentry. The court of session, as commissioners of teinds (tithes), have power from time to time to augment, as they may think fit, the livings of such clergymen as may not be already in the receipt of the whole disposable tithes of their respective parishes. But in many parishes the tithes have been wholly taken up or exhausted; and in 1812 an act was passed to raise, at the public expense, the incomes of such clergymen as had less than 150*l.* a year, exclusive of glebes and houses, to that sum. At this moment (1850) the average income of the clergy of the Church of Scotland, exclusive of the ministers of *quoad sacra* parishes, amounts to about 200*l.* a year, over and above

their glebes and houses, the average value of which may be estimated at about 35*l.* a year.

The dissenters from the church, exclusive of the adherents of the Free Kirk, consist principally of the members of the United Presbyterian Synod, the Reformed Presbyterian Church, and the Congregationalists. The first great secession took place in 1741, in consequence, as already stated, of the enforcement of the law of patronage. There are some other bodies of dissenters; and of late years, owing to the influx of Irish into the western co., the Roman Catholics have received a great accession of numbers. The doctrines of the Church of England have also become fashionable among a good many of the higher classes. On the whole, however, the number of dissenters has been very greatly exaggerated; and at this moment (1850) we do not suppose that, altogether, they exceed 700,000, or, at the outside, 750,000.

Public Instruction. — An endowed school has been for a lengthened period established in every parish in Scotland. The landlords are bound to build the school-house, and a house for the residence of the master, and to pay him a salary, which, at present, varies from 25*l.* 12*s.* 9*d.* to 34*l.* 4*s.* 8*d.* The power of nominating and appointing schoolmasters is vested in the landlords and minister of the parish. It is usually expected that a Scotch parochial teacher, besides being of unexceptionable character, should be able to instruct his pupils in the reading of English, the arts of writing and arithmetic, and the more useful branches of practical mathematics, and be possessed of such classical attainments as qualify him for teaching Latin and the rudiments of Greek.

Exclusive of the statutory allowance, schoolmasters receive fees from their pupils, according to a scale regulated by the landlords and clergymen. They are in general very moderate, varying, for the different branches of education, from 1*s.* 6*d.* to 7*s.* 6*d.*, and, in a few instances, 10*s.* a quarter. An efficient system of education has, in consequence, been brought within the reach of all classes, and has been productive of the greatest advantages.

In the largest country parishes there are often subsidiary schools, established by the landlords, the masters of which are allowed a portion of the statutory salary; and in all the more considerable towns by far the greater proportion of the children are educated at non-parochial schools. Speaking generally, classical instruction is not carried to the same extent, in any of the Scotch schools, that it is carried in Eton, Harrow, and the higher class of English schools; but, on the whole, they furnish an extremely good and useful education.

Several returns have been published of the number and description of the various Scotch schools, and of the number of young persons of both sexes by whom they are attended. But these returns are all very incomplete, and are, in fact, little better than worthless. At an average, we believe, it may be estimated that from an eighth to a tenth part of the inhab. of Scotland are at schools or academies of one description or another.

The higher branches of education are taught in the universities of Edinburgh, Glasgow, Aberdeen, and St. Andrew's (which see). Each of these universities has faculties of literature, philosophy, law, and medicine. A religious test may be required from the professors, but not from the students; the latter do not live in college halls, as in the English universities, and are not subject to any college jurisdiction when beyond the walls of the university.

Edinburgh University was long celebrated as a medical school, and still, indeed, preserves some considerable portion of its ancient celebrity. Probably, on the whole, the instruction afforded by the Scotch universities, though in many respects defective, is as good as can reasonably be expected, so long as the vicious practice is followed of allowing the professors to judge of the qualifications of candidates for degrees and literary honours; that is, of the merits of their own pupils, and, by consequence, of the solidity and efficiency of their own plan of instruction. The Scotch universities labour under great disadvantage, from the want of a superannuation fund. The professors, having no resource on which to fall back in the event of their getting into ill health, are frequently obliged to cling to their chairs, as a means of subsistence, long after they have been disabled, by sickness and otherwise, from a proper discharge of their duties.

Language and Literature. — It has long been

a prevalent opinion that the English and Scotch languages are merely different dialects derived from the same common source; and there are very good grounds for thinking that this opinion is correct. There is, however, no reason for concluding, as some have done, that the Scotch is merely a corrupt dialect of the English. It is quite as ancient as the latter; and both, in fact, are dialects derived from the same original tongue. The Gothic occupants of the lower parts of England and Scotland did not all come from the same parts of the Continent, so that there would most probably be at the epoch of their immigration considerable differences in their dialects: and while these, on the one hand, would be diminished by their intercourse with each other in their new settlements, they would, on the other hand, be, in some instances, likely to be increased by their intercourse with the Celts and ancient inhabitants of the country, and with new comers; till, at last, they would be moulded into new dialects of the same common language. One of the most ancient existing specimens of the Scotch language is a poem on the death of Alexander III. in 1288, written soon after the event. Barbour, a contemporary of Chaucer, is also a distinguished writer; and the language was farther improved and perfected by James I., Dunbar, and Douglas, bishop of Dunkeld, translator of Virgil, &c. But since the union of the crowns, and especially since the union of the kingdoms in 1707, the Scotch has been gradually giving way to the English, and it is now used only by the vulgar and illiterate. The poems of Burns, and some of Scott's novels, have tended, in no ordinary degree, to perpetuate and popularise the Scotch language; but notwithstanding their powerful influence, the fair presumption seems to be, that, at no very remote period, it will wholly cease to be a spoken language. In fact, it may be said to be almost extinct already; for, though most persons use Scotch words in their ordinary conversation, there are now very few, indeed, if any, even among the lowest classes, who speak Scotch without a large intermixture of English.

The Erse or Gaelic, the language generally spoken by the lower classes in the Highlands, is, no doubt, the language of the ancient occupants of the country. It differs but little from the Irish; so little, that after a short intercourse, persons speaking Irish and those speaking Erse have no difficulty in understanding each other. But it is a curious fact that the Irish and Erse are wholly unintelligible to the Welsh. The Manks, or native language of the Isle of Man, is a dialect of the Erse or Irish.

It would be useless in a work of this kind to enter upon any statements with respect to the literature of Scotland. It is sufficient to say that there are but few departments in which it cannot boast of writers of the highest excellence. Speaking generally, its literature, as contrasted with that of England, may, perhaps, be said to be less learned, less practical, and less playful; and to be more metaphysical, scholastic, and sustained. It would not, perhaps, be very difficult to specify the causes which have occasioned this difference in the literature of the two divisions of the island; but, owing to the more intimate connexion that now subsists between the people of both, it is probable that it will gradually become less perceptible.

Down to a comparatively recent period the Scotch newspaper press was alike inefficient and degraded. This was not a consequence of any indifference on the part of the public to news-

paper discussions, but was wholly ascribable to the corrupt state of the court of judicature. Full scope was given to the panegyrists of the government of the day, how worthless soever it might be; but any one who happened to question its merits, or who ventured to espouse or recommend any doctrine or theory not approved by the lord advocate for the time being, was, in truth, at the mercy of the latter, and might be banished almost at pleasure. The servility of the judges, and the facility of packing juries, afforded the agents of government a ready means of crushing any obnoxious writer; and, in fact, it may be said that Scotland had no newspaper press, or none worthy of the name, till after the close of last war. During the year ending the 5th January, 1850, 87 newspapers were published in Scotland, to which 6,381,941 stamps were issued at 1d., and 202,200 at ½d. These papers paid, during the same year, 18,426l. 1s. 6d. duty on advertisements.

The establishment of the *Edinburgh Review*, in 1802, is an important epoch, not only in Scotch, but in European literature: it effected a total and most advantageous change in the previous style of criticism and periodical writing.

The *Provision for the Poor* that has long existed in Scotland originated, like that of England, in attempts to repress mendicity. The acts of the Scottish parliament in reference to this subject bear, in many respects, a close similarity to the English acts, and are partly, indeed, copied from the latter. They differ, however, from the English laws in this important respect, that they make provision only for the maimed and impotent poor, and not for those who are able-bodied; and it is now generally laid down by the best authorities that the latter have no title to claim relief as matter of right. The administration of the poor laws in Scotland has, also, differed extremely from their administration in England; and to this, more than to any difference in the laws themselves, the wide discrepancy that now exists between the provision for the poor in the two countries is mainly to be ascribed. In Scotland the administration of the poor's funds has been usually vested in the kirk sessions; but, at the same time, any landlord might call the session of any parish in which he had property to account for their administration of these funds, and might attend and vote at their meetings in reference to such matters. No justice of the peace, sheriff, or other inferior judge has been permitted to interfere with the proceedings of the kirk sessions and landlords in their conduct of the affairs of the poor; and as the members of the session consist, for the most part, at least in country parishes, either of landlords or farmers, holding under leases of considerable length, they have always been anxious to keep the charge for the poor within the narrowest limits.

So economically, indeed, were the poor's funds administered, and so anxious were the administrators to allow none but really necessitous persons to participate in them, and to keep the allowances as low as possible, that assessments for the support of the poor were not introduced, until within these few years, into more than about a third part of the parishes of Scotland, the poor being supported in the others by collections made at church doors, and other voluntary contributions. "The Scotch," to use the words of a Report by the General Assembly in 1820, "have uniformly proceeded on the principle, that every individual is bound to provide for himself by his own labour, so long as he is

able to do so; and that his parish is only to make up that portion of the necessities of life which he cannot earn or obtain by other lawful means. Even in cases of extreme poverty, the relations and neighbours of the paupers have a pride in providing for their necessities either in whole or in part. This circumstance will account for the small number of paupers in some very populous parishes; and serves at the same time to explain a fact which is obvious in so many returns in the country districts, that the sums given to paupers appear to be so disproportioned to what their real necessities require. A small sum given to aid their other resources affords them the relief which is necessary; and it would be both against the true interests and the moral habits of the people were a more ample provision made for them by their parishes."

But an opinion had been gaining ground for some considerable time, that economy had been carried to an excess, and that the really necessitous poor were not adequately provided for; and there can be no doubt that this opinion was perfectly well founded. The statements in Dr. Alison's valuable publications, and those published in the articles *EDINBURGH* and *GLASGOW*, in the former edition of this work, exhibited a state of things that called loudly for alteration and amendment. Economy is not the only thing to be attended to in the administration of the affairs of the poor. No doubt it is a most important consideration; but the claims of humanity are not to be trampled under foot for its sake, as was certainly the case in many parts of Scotland.

In compliance with the public feeling on the subject, government appointed, in 1843, a commission to inquire into the state of the poor in Scotland, and into the administration of the laws for their relief; and the report of the commissioners, though in some respects defective, fully showed the extreme inadequacy of the provision made for the relief of the poor, and the necessity of its augmentation. A bill, founded in part on the recommendations of the commissioners, was forthwith introduced into parliament, and passed into a law, the 8 & 9 Vict. c. 83. This act effected some very important changes. It established a board in Edinburgh for the supervision of the affairs of the poor. This board is authorised to inquire into the condition and management of the poor in all boroughs and parishes, and to order returns, &c. from them. But though it may make suggestions, it has no power to order the functionaries to whom the care of the poor is committed to vary their mode of management. The act continues the old method of conducting parochial affairs by means of the kirk sessions, in all those parishes in which the sums required for the relief of the poor are raised by voluntary contribution. But it entrusts the management of all matters connected with the poor, in parishes into which assessments have been introduced, to parochial boards elected by the landlords and other people of property. It, also, orders an inspector, or inspectors of the poor, to be appointed for each parish or combination of parishes, &c. The law as to able-bodied parties in want was not interfered with by the act. They may be relieved (in fact they must be relieved); but they are not entitled to relief as matter of right.

There can be no doubt that, on the whole, the operation of this law has been beneficial. The increasing amount of the assessment has been appealed to in proof of the contrary allegation. But it proves nothing of the sort. Economy was formerly carried to a vicious excess; and

the destitute poor were exposed to sufferings disgraceful to a civilised country. This state of things has been altered for the better, and hence the unfounded complaints made against the law. Owing, also, to the continued influx of immigrants from Ireland, the claimants for relief from the poor's funds have been greatly increased, and the country is thus really taxed to maintain the greatest grievance by which it has ever been visited.

Receipt of Money for, and Expenditure of the same upon, the Poor of Scotland in 1849, distinguishing the different Counties.

Historical Sketch. — The early history of Scotland is at once obscure and uninteresting. The country was long one of the most barbarous in Europe; and though Kenneth II. (anno 838) is said to have united the extensive territories from the Tyne N. to the Pentland Frith into one kingdom, it is abundantly certain that various extensive districts were in great measure independent of the crown for several centuries after this period. In consequence of their early holding Northumberland, Cumberland, and

other lands in England, the kings of Scotland were accustomed to appear in the English court to perform homage for these possessions; in the same way as the English monarchs were themselves accustomed to perform homage to the kings of France for Normandy and the other provinces held by them in that kingdom. (*Stuart's Public Law of Scotland*, note viii.) On the extinction of the direct line of the Scottish kings in 1290, by the death of Margaret of Norway, John Balliol and Robert Bruce, descend-

ants of the Scottish king David I., appeared as competitors for the crown. The pretensions of both were supported by powerful parties; and, to avoid a civil war it was agreed to refer the matter to the amicable decision of Edward I., king of England. This able and politic prince availed himself of the opportunity to advance the principle, for which the homage that had been performed by the Scotch princes for their English possessions afforded a colourable pretext, that the kings of England were the paramount sovereigns or liege lords of Scotland, and that the competitors for the crown should do homage to him as such. This was consented to; and Edward, finding Baliol most suitable to his views, decided in his favour. The latter, however, being less subservient than was expected, was speedily set aside by Edward, who attempted to seize the kingdom on pretence of its having escheated to him through the rebellion of his vassal.

The nation, however, was not to be so transferred. Sir William Wallace raised the standard of independence; and in the sequel, the famous Robert Bruce, grandson of the competitor of Baliol, appeared in the field; and after unparalleled exertions, continued through a series of years, the great victory of Bannockburn (1314) secured the independence of Scotland, and established the conqueror and his family on the throne.

The only daughter of Robert Bruce having married the lord high steward, Robert, the issue of that marriage, and the first of the family of Stuart who arrived at the royal dignity, succeeded to the crown on the death of David II., in 1371. From this period, the history of Scotland is comparatively well known; and the continued and extraordinary ill-fortune that attended the lengthened series of princes of the House of Stuart has vested it with more than ordinary interest.

The principles of the reformers were early introduced into Scotland, and were eagerly adopted by the great bulk of the nobility and people. The Protestant religion obtained the ascendancy in 1560, shortly before the return of the beautiful, but ill-fated Queen Mary from France, where she had been sent to be educated. At this period the royal authority was at a very low ebb; the most violent contentions prevailed amongst the nobility; and it would have required a sovereign of no ordinary ability and energy of character to conduct the government under such difficult circumstances. We need not, therefore, be surprised at the failure of Mary, who, though not without good talents, was wholly inexperienced, at the same time that she had the misfortune to have been strongly imbued with anti-Protestant prejudices, and that the violence of her passions made her sacrifice her own reputation and innocence, and the well-being of the kingdom, to their gratification.

Having been deposed in 1567, Mary was succeeded by her son, James VI., then a minor. The latter succeeded, on the demise of Queen Elizabeth, in 1603, to the crown of England, when the two British kingdoms were happily united under one sovereign. (See Vol. I. 790., &c.)

From the accession of the House of Stuart to the union of the crowns, a period of about 290 years, Scotland, speaking generally, was in a most unsettled, turbulent state. The feudal system had been early introduced into the country; and the great estates and influence enjoyed by several of the nobles enabled them to rival the sovereign in power and importance, and sometimes to despise his orders,

and insult his person. In France, England, and other countries, the sovereigns, by enfranchising the inhabitants of the great towns, and attaching them to their interests, succeeded, through their assistance, after a lengthened struggle, in abating the pride and independence of the barons, and reducing them to obedience. But the kings of Scotland had no such support on which to fall back: there was not, in fact, a single great town in the kingdom; and they had nothing to trust to but the supplies of men and money they could draw from the crown estates, and from the contributions of such of their vassals as happened to be at the time in their interest, or whom they could coerce. In consequence of these, and other concurring causes, the power of the Scottish kings was circumscribed within the narrowest limits; the civil broils in which they were almost always engaged were, in most instances, fomented and abetted by the government of England; and, a few short intervals excepted, the country was involved in continuous anarchy and confusion.

The union of the crowns in 1603 introduced a great change for the better into the state of domestic affairs in Scotland. The barons could no longer look to England for open or underhand support in their contests with their sovereigns; while, at the same time, the power of the latter was vastly increased by their being able to employ the resources of a much more civilised, populous, and powerful monarchy in their disputes with their ancient subjects. Hence, though Scotland laboured under numerous grievances, resulting principally from the unreasonable hostility of the sovereigns to the Presbyterian form of church government, to which the people were enthusiastically attached, she gained prodigiously in tranquillity and good order subsequently to 1603.

The union of the kingdoms in 1707 was, as it were, the necessary result and completion of the union of the crowns. Though excessively unpopular at the time, and opposed by many of the best Scotch patriots, it has been of vast advantage to Scotland, as well as to the empire generally.

The consequences of the rebellion of 1745 were also advantageous, notwithstanding the unnecessary and disgusting cruelty exhibited in its suppression. It extinguished for ever the long-cherished hopes of the Jacobites; and it stimulated government to take effectual measures for abating the barbarism that prevailed in the Highlands, and for the introduction of a more efficient administration of justice into all parts of the country. In this view the old feudal hereditary jurisdictions were abolished, and sheriffs nominated and paid by the crown were appointed in their stead; and this most salutary measure being accompanied by the construction of military roads, that were carried into the remotest and least accessible districts, the empire of the law was fully established; disorders of all sorts were promptly repressed; and at length the public energies were happily turned into those departments of industry and enterprise in which they have achieved such astonishing results.

SCUTARI (an. *Chrysopolis*), a town of Asiatic Turkey, being, however, in fact, a suburb of Constantinople, opposite the latter, on the other side of the Channel of Constantinople, on the Bithynian shore, about 1½ m. E. Seraglio Point. Its pop. has been variously estimated at from 30,000 to 60,000. It is built on the declivity of several hills, and has a very picturesque appearance from the opposite shores: its interior is similar to that of the Turkish capital, and it is built in the same style. A palace of the sultan, with extensive gardens, barracks constructed by the late sultan Mahmoud, several handsome mosques, a noted college of howling dervishes, several large cemeteries, with public baths, bazaars, &c., are the principal edifices and public establishments. It is a rendezvous for the merchants and caravans from Armenia and Persia trading to Constantinople, and is the first station for the assembling of the Turkish troops in Asia.

Scutari is very ancient, and is said to owe its name of *Chrysopolis* to the circumstance of the treasury of the Persians having been established in it when they attempted the conquest of Greece. Its vicinity was memorable for the decisive victory obtained by Constantine the Great over his rival Licinius. (*Cramer's Asia Minor*, i. 191.; *Tournefort*, *Clarke*, *Elliott*, &c., *passim*.)

SCUTARI, a fortified town of European Turkey, and cap. of a pachalik in Albania, S. of the Lake Scutaro (*Labegetis Palus*), at the confluence of the Bojana and nassi, about 16 m. from the embouchure of the former in the Gulf of Drino, in the Adriatic, 45 m. S.E. Cat. Its pop. has been estimated at 20,000. It has a very strong citadel, on an isolated rock; with various mosques, and Greek and Rom. Cath. churches. It stands on uneven ground, and is built in a very straggling manner.

A rather active trade in timber is carried on by rafts which ascend the Bojana to the lake; the inhabitants manufacture cotton fabrics and arms, and build small vessels. Scutari is supposed to occupy the site of an. *Scodra*, the cap. of the Illyrian king Gentius; which subsequently appears to have become a Roman colony. It is still a place of importance; and when Sir John Lubbock travelled in Albania, the power of its chief was the only counterpoise to that of Ali Pasha. (*Hobbes's Albania*, 462; *Cramer's Anc. Greece*, i. 40, 41.; *Schellman*.)

SCYLLA and CHARYBDIS: The former is a famous rock and town of S. Italy, at the N. entrance to the narrow strait separating Italy from Sicily; and the latter an equally famous whirlpool in the strait near the Italian coast. Scylla is a bold rocky headland, about 100 ft. in height, projecting into the sea, and hollowed out at its base into caverns by the action of the waves. It is crowned by a castle, in lat. $38^{\circ} 14' 15''$ N., long. $15^{\circ} 44'$ E. There is a sandy bay on each side the rock; and the town of Scylla, built principally on the steep acclivity of the ridge, stretches down to the shore on either side. It has about 5,000 inhabs., said to be expert fishermen, seamen, and divers.

This little town suffered tremendously from the earthquake that devastated Calabria in 1783. A large portion of the inhabs., with the prince at their head, fled to the hills, believing it to be least exposed to danger. But they had not been long there when an adjoining cliff fell into the sea; and the waves, driven back by its fall, rushed forward again with such tremendous fury as to rise high on the shore, sweeping along with them in their recoil many persons, not one of whom escaped alive! (*Switzerland*, ii. 419.)

The rock of Scylla is exactly 6,047 Eng. yards, or nearly 10 miles from the opposite point of Faro, at the N.E. extremity of Sicily. The whirlpool of Charybdis is not, however, opposite to Scylla, but within the strait outside the point of land enclosing the harbour of Messina. From its prominent position at the mouth of the straits, Scylla is exposed to the full action of the current, the sea making a loud noise in the caverns it has hollowed in the rock, and, of course, is much increased in storms. Charybdis seems to be formed by the main current passing through the straits from the N. being thrown over to the Italian shore by the point of Pezzo, and meeting the local current running in an opposite direction. It is 70 to 90 fathoms deep, circling in quick eddies; and Captain Smyth says that small craft are sometimes entered by it, and that he had seen a 74-gun ship whirled round on its surface." (*Memoirs of Sicily*, 123.) notwithstanding the action of the contrary currents, the formidable appearance of Charybdis, there is no real danger in navigating the straits, provided caution be exercised. Although, however, it be quite true that Homer, in depicting the terrific dangers encountered by Ulysses in this famous strait (see *Pope's Iliad*, lib. xxi. lin. 87, &c.), has made a very liberal use of the license allowed to a poet, still it is abundantly plain that it must have been much more dangerous in antiquity than at present. It was a generally received opinion among the ancients that Italy and Sicily were united, and that they had been torn asunder by some convulsion of nature. Pliny says, "*Sicilia, quoniam Bruttio agro coherens, mox interfuso mari avulsa*." (iii. cap. 8.; see also *Silius Italicus*, lib. xiv. lin. 2.; &c.) But whether this were so or not, it is plain that the action of the current for a period of more than 2,000 years must have materially widened and deepened the strait, and worn down those rocky prominences that render such narrow channels peculiarly dangerous. The duration of the strait has also, no doubt, been materially altered in the interval by the earthquakes so prevalent in this region; so that we are by no means entitled to ascribe the statements of the ancients, in regard to its dangers, solely to their ignorance of navigation or their ignorance of the marvellous.

Vessels in passing through the straits, in order to avoid being within the vortex of Charybdis, sometimes run close to Scylla, which gave rise to the famous proverbial maxim — "*Incidit in Scyllam cupiens vitare Charybdis*" — applicable to those who, to avoid a less, run into a greater danger.

BASTIAN (ST.), a fortified frontier city and sea-port of Spain, cap. prov. Guipuscoa, in Biscay, at the extremity of a low sandy tongue of land, projecting into the Bay of Biscay, 10 m. W. by S. Fuenterrabia, and 10 m. E.N.E. Bilbao. Pop., according to Miliano, 9,720,

exclusive of its garrison; but, including this, and its suburbs, the pop. may be taken at 12,000. Having been in a great measure rebuilt since 1812, it is now one of the neatest and most regularly constructed towns in the peninsula, presenting a favourable contrast to most other Spanish cities. It is defended on the E. and W. by strong walls, washed by the sea; on the N. by the castle of Mota, on Mount Urgullo, a rugged cone near 400 ft. in height; and on the S. it is shut off by advanced military works, and by the little river Urumea, from its suburb of St. Catherine. The castle is well supplied with water, and is a fortress quite independent of the city, with which it communicates by two routes, both defended by various batteries. St. Sebastian has some handsome squares, several churches and convents, a civil and military hospital, &c.; its streets are clean, and it is abundantly supplied with water, though not of the best quality. The Urumea is crossed by a stone bridge of 8 arches. Though secure, and well defended, the harbour is difficult of entrance; it is formed by a mole, and is of small size. St. Sebastian has always been a place of considerable trade, and was the seat of the Philippine Company. It is the port whence Pampeluna, Vittoria, Logrono, &c. obtain most part of their supplies of colonial and other foreign goods; and at which the greater part of the French and English manufactures destined for Madrid, and other towns in the interior, are imported. Its exports are chiefly iron and wool. It had formerly some large cordage factories and tanneries, but these have mostly fallen into decay. It is the residence of a military governor, 2 justices, and the seat of a sub-delegation of police; a lottery department, a tribunal of commerce, &c. From its being, as it were, one of the keys of Spain, its possession has always been an object of great importance in the contests between the French and Spaniards. The former took it in 1719, 1794, and 1808; and held it from the last-mentioned epoch till 1813, when it was taken by the British forces under Sir Thomas Graham, now Lord Lynedoch. The latter were repulsed in their first attempt to carry it by storm in July; but they succeeded, though not without an enormous loss, in the second assault on the 31st of August. A fire having broken out in the town during the assault, it was all but destroyed. We regret to have to state that, notwithstanding every exertion on the part of the officers, the most horrible excesses were committed by the victorious soldiers. (*Milano, Dic. de España*, &c.; *Napier's Peninsular War*, vi. 65—197.)

SEDAN, a fortified town of France, on its N. E. frontier, dép. Ardennes, cap. arrond., on the Meuse, 12½ m. E. S. E. Mézières, lat. $49^{\circ} 42' 29''$ N., long. $4^{\circ} 57' 51''$ E. Pop., in 1846, inc. comm., 13,501. Though an important frontier town, the *Dic. Géog.* says that its works, some of which were constructed by Vauban, have latterly been neglected; and its citadel, at its S.E. extremity, has been converted into an arsenal. It stands on very uneven ground, and is separated into two unequal parts by the Meuse, here crossed by a stone bridge. It is well built; the streets, which are wide and clean, are ornamented with numerous fountains; the houses are mostly of stone, roofed with slate, and in the environs are various public walks.

Sedan has excellent cavalry and other barracks, a military hospital for 500 patients; other military establishments; a Calvinist, and several Rom. Catholic churches, a public library, communal college, a handsome theatre, &c. It is the seat of a tribunal of primary jurisdiction, a chamber of manufactures, &c. The water is said to have a tendency to produce *goutte*.

Sedan has been long celebrated for its woollen manufactures, consisting principally of fine black cloths, and cassimeres. In 1836-37, from 11,000 to 12,000 work-people were employed in the woollen manufactures of the town and its vicinity, of whom from 3,000 to 4,000 belonged to the town; from 2,000 to 2,500, belonging to the neighbouring villages, went to work daily within the town; and the remainder, consisting principally of weavers, inhabited the country for a distance of from three to four leagues round. The last, who also occupy small patches of land, work at the loom in their own cottages; whereas those who live in and near the town are mostly employed in large manufacturing establishments. In these, they work, nominally 10, and really from 14 to 15 hours a-day. But, notwithstanding these long hours, the work-people of Sedan are decidedly better fed, clothed, and lodged, than those of most other manufacturing towns of France: men get from about 2 to 3½ fr. a day; women from 1 to 2 fr., and children from 10 sous to 1 fr. (*Villermé*, i. 264.)

The greatest harmony subsists between the work-people and the manufacturers. Drunkenness is comparatively rare, though in other respects their habits might be a good deal improved. Instruction is much more extensively diffused among the work-people than at Rheims, and, speaking generally, they have all the signs of good health; circumstances chiefly consequent on the non-introduction of children into the factories at

too early an age. Villermé farther adds, that their education and morals are both in a state of improvement. (*Tableau des Ouvriers*, i. 253—279.)

Hosiery, leather, arms, and hardware, are also produced at Sedan; and it has numerous dying-houses, with an extensive trade in drugs, &c. Previously to the Revolution Sedan was the cap. of a principality, which had often changed hands in the middle ages, but which was finally exchanged with Louis XIV. for some other fiefs by the Turenne family. One of the greatest of the French generals, the famous Marshal Turenne, was a native of this town, in the citadel of which he first saw the light on the 16th of September, 1611. His statue, in bronze, ornaments the principal square. (*Hugo*, art. *Ardennes*; *Dict. Géog.*, &c.)

SEGORBE (an. *Segobrigar*), a city of Spain, cap. distr. of its own name in Valencia, near the Palancia, 18 m. N.W. Murviedro. Pop., between 6,000 and 7,000. Streets wide, and most of its houses well built: it has several squares, numerous public and private fountains, a cathedral in which are some good paintings, several convents, a prison, workhouse, and other public edifices. Its inhabitants are occupied in the manufacture of starch, earthenware, and paper, the distillation of brandy, and the quarrying marble in the vicinity. Two large fairs are annually held here. Various Roman antiquities have been found within the city. (*Milano*; *Fisher's Picture of Valencia*, &c.)

SEGOVIA (an. *Secovia*), a city of Spain, Old Castile, cap. of the prov. of its own name, 48 m. N.N.W. Madrid. Pop., according to Milano, 12,880. It is built on two hills and the intervening valley, the unevenness of the site giving it a wild look. Most of the streets are crooked and dirty, the houses also are ill built, and chiefly of wood. The public buildings comprise 18 churches, including the cathedral, five hospitals, a mint, a college for cadets in the old castle or Alcazar, and military barracks. The cathedral, which is described by Swinburne as one of the handsomest churches in Spain, has a tower 330 ft. high, and exhibits a mixture of the Gothic and Arabian styles, nearly resembling that in the great church at Salamanca. The interior is characterised by a simplicity rarely seen in Spanish churches, the effect of which is infinitely superior to that of the gildings and ornaments elsewhere observable. The Alcazar is in great preservation, occupying a commanding situation on a rock rising above the open country. Towards the town is a large court before the great outward tower, formerly used as a prison, but now as a college of cadets. The rest of the buildings form an antique palace, once the favourite residence of Ferdinand and Isabella: it comprises several magnificent halls, with gilt ceilings; and along the cornice of the grand saloon are 52 wooden statues of the kings of Spain seated in state. The military college was remodelled on the formation of the present constitution, and the instruction given by the professors embraces most branches of knowledge connected with military science. The great glory of Segovia, however, is its aqueduct, supposed to have been built in the time of Trajan, and certainly one of the most perfect specimens of Roman architecture in Spain. Swinburne (ii. 248.) says, that "it is not only an admirable monument for its solidity and good masonry, which have withstood the violence of barbarians and the inclemencies of the seasons during so many ages, but is wonderfully beautiful and light in its design. It consists of 161 arches, in two ranges; that nearest the ground comprising 118, of which 43 are surmounted by an equal number of others: the whole is built of square stones, without mortar; and at the top is a channel, once hollow, but now filled up, only 8 ft. wide, and without a parapet. The total length of the aqueduct is 750 yards, and its height in crossing the valley (measured close to the *Plaza del Azoguejo*, where two of the arches cross the street) is estimated by Twiss at 102 ft., though other travellers say only 94 or 95 ft. (*Comp. Twiss*, 82, with *Townsend*, ii. 115., and *Inglis*, i. 286.) Swinburne considers it superior in elegance even to the Pont du Gard, near Nîmes; but, in point of fact, the two differ remarkably; the latter having 3 instead of 2 rows of arches, and the extreme height being 143 ft.

The mint of Segovia, the most ancient in Spain, is situated at the bottom of the city, on the small river Eresma, the water of which turns its machinery: for many years, however, its operations have been confined to the coinage of maravedis, quartos, and other copper pieces. Segovia is said to be a decayed city, and most books on Spain contain accounts of the former flourishing state of its woollen manufactures; but Capmany has shown that, if not wholly unfounded, these accounts are, at all events, very greatly exaggerated; and that, when most flourishing, the number of looms in Segovia did not exceed 300 (*Questions Critiques*, p. 37.), which, perhaps, is about their present number. It, also, produces paper, earthenware, and glass. A fair held here in June is much frequented. In the neighbourhood are mines of lead and copper, as well as quarries of black marble.

The early history of Segovia is somewhat obscure; but, like most other cities of Castile, it belonged successively to the Romans, Goths, and Moors, from the last of whom it was taken at the beginning of the 15th century. During the Peninsular war the town was occupied by the French from 1808 to 1814. (*Townsend*, ii. 130—134; *Inglis*, i. 284—287.; *Milano*.)

SEINE, the smallest, but most populous, wealthy, and important dép. of France, being that in which the capital is situated. It extends between lat. 48° 43' and 49° 58' N., and long. 2° 10' and 2° 35' E., being entirely surrounded by the dép. Seine-et-Oise. It is of a nearly circular shape, about 15 m. in diameter. Area, 47,548 hectares. Pop., in 1846, 1,364,933. The Seine traverses this dép. in its centre, with a general direction from N.W. to S.E., and receives the Marne within its limits. There are a few hills, but none of much elevation. Mont-Valerien does not rise to 450 ft. above the level of the Seine, and Montmartre is only 344 ft. in height. The soil is chiefly calcareous, this dép. forming the centre of the remarkable tertiary region called the Paris basin. (*See PARIS*, ante, p. 466., and *FRANCE*, vol. i. 850.) But the chalk is covered with a bed of vegetable mould of considerable thickness; and the manure supplied by the capital renders the dep. very productive. The arable lands are estimated at 29,295 hectares; meadows, 1,543 ditto; vineyards, 2,784 ditto; and orchards, gardens, &c., 3,502 ditto. Corn is not extensively raised, and the little that is produced is but indifferent. It furnishes very superior peaches, and other fruits; and there are numerous market gardens for kitchen vegetables, &c. A good many cattle, and other live stock, are fattened for the Paris markets, and there are some flocks of superior sheep. In 1835, of 66,897 properties subject to the *contrib. foncière*, 17,272 were assessed at less than 5 fr.; while 12,522 were rated at from 100 to 330 fr., and 2,006 at 1,000 fr. and upwards. The manufacturing industry centres in Paris, which see. It is divided into 3 arrond., and sends 14 mems. to the Ch. of Dep. Registered electors, in 1838-39, 16,871. Total public rev., in 1831, 95,592,188 fr.; expenditure, 15,843,551 fr. (*Hugo*, art. *Seine*, &c.)

SEINE (an. *Sequana*), a river of France; and though by no means the largest, yet one of the most important in the kingdom, being that on which the capital is built. It rises in the dép. and mountain-chain of the Côte d'Or (by which it is separated from the basin of the Loire), about lat. 47° 30' N., long. 5° E., 20 m. N.W. Dijon. It flows generally in a N.W. direction, between the basins of the Loire on the S.W., and of the Meuse and Somme on the N.E., through the dép. of Aube, Seine-et-Marne, Seine-et-Oise, Seine, Eure, and Seine-Inférieure, to the British Channel, which it enters by a wide estuary at Havre, about lat. 49° 30' N., and long. 0° 10' E., nearly opposite Newhaven in Sussex. Its entire course, in consequence of its numerous windings, is estimated at 500 m., for nearly 350 of which it is navigable. Its source is about 1,420 ft. above the level of the sea. But more than 3-4ths of its descent takes place within the first 100 m. of its course, for at Troyes it is not more than 440 ft. above the sea; and at Paris its mean elevation above the latter is only 51 ft., and at Rouen 26 ft. (*Braguère*, *Orographie*.) From its not rising in mountains of any great elevation, it is neither subject to serious inundations, nor has it a rapid current; and the latter circumstance, together with its gentle rate of descent in the lower parts of its course, renders it highly suitable for navigation. The chief obstacles to its utility are the shifting sand-banks in its estuary, and some shallows between Quillebeuf and Rouen. At Paris the Seine is from 300 to 500 ft. in width; at its mouth it is 7 m. in width. It is here subject at the return of every tide to a phenomenon termed the *barra*, similar to the *mascaret* in the Dordogne, the *bore* in the Solway Frith, Ganges, &c. This consists of a wave of great magnitude, with an almost perpendicular front, impelled inwards from the sea with much violence as high as Jumèges, and sometimes even as far as Rouen. It gives notice of its approach by a noise which, according to Hugo, is heard for forty minutes beforehand, but it is, notwithstanding, frequently productive of damage to shipping. The tide in the Seine is usually perceptible as high as Rouen, to which city the river is navigable for vessels of 200 tons. Respecting the trade of the Seine, see the articles HAVRE and PARIS.

The Seine receives several considerable tributaries; as the Aube, Marne, and Oise, from the N.E., and the Yonne, Eure, and Rille, from the S. and W. Besides Paris, several large and flourishing commercial cities and towns are seated on the Seine; as Rouen, Elbeuf, Troyes, Melun, and Montargan, with Chatillon, Bar, Nogent, Corbeil, St. Germain, and Honfleur; and at its mouth is Havre, which, Marseilles excepted, is the first commercial port of France.

The Seine and its tributaries are connected by the canals of Briare, Orleans, and Nivernais, with the Loire; by that of St. Quentin with the Somme and Scheldt; by that of Ardennes with the Meuse, and by that of Bur-

dy with the Loire. The canal of Oucq (see PARIS, 71.) also communicates with it. The banks of the sea below Paris have been much praised for their fertility. "I reached," says Mr. MacLaren, "Rouen by diligence from Paris in 1½ hours. The road passes by the valley of the Seine, which is extremely beautiful but deficient in variety. It is from 2 to 10 m. in width, and is bounded on both sides, not by hills, but *terres*, or table-lands, of a very uniform elevation. The lands are carefully cultivated, but enclosures are rare, and the cottages small and mean. I went from Rouen to Havre by the steam-boat in eight hours." (*See in France and Italy*, pp. 196, 196.)

SEINE-INFÉRIEURE, a maritime *dép.* of France, N., formerly comprised for the most part in the *v.* of Normandy, having E. the *déps.* Somme and Oise, Eure and Calvados, and W. and N. the British Channel. Area, 602,912 hectares. Pop., in 1846, 756,862. S. boundary consists mostly of the Seine and its *marais*. There are some hill chains, but none of much sequence. Coasts in general abrupt, presenting a succession of calcareous cliffs. Climate moist, and colder on the opposite coast of England. Soil generally areous or sandy; but in the *arrond.* of Havre and *not* there are some very fertile tracts, consisting of a light clay. In 1834, the surface is said to have been ributed as follows, viz.: 578,016 hectares arable, 24 *do.* meadows, 61,173 *do.* orchards and gardens, and 44 *do.* woods. Agriculture is more advanced in this *dép.* in most other *déps.* Ploughs of a superior kind have latterly been introduced; the efficiency of manures well understood; and fallows have been to a considerable extent superseded by the introduction of an improved rotation. Near Havre, on the large farms only, 10 acres are in fallow: of the arable land, about third part may be in wheat; one third in oats, barley, rye; one sixth in clover; one twelfth in peas and beans, and one twelfth in flax; and these are about the portions throughout most part of the *dép.* In 1835, 134,071 properties subject to the *contrib. foncière*, 10 were assessed at less than 5 fr., while 2,412 were assessed at from 500 to 500 fr., 1,522 at from 500 to 1,000 and 754 at 1,000 fr. and upwards; so that the proportion of large properties is greater in this than in any other *dép.* of France; and to this its superior agriculture is, in great measure, to be ascribed. The large proprietors own or never farm their own lands. Some farms run on 200 to 300 acres, but in general they are much smaller. They are almost always let for a term of 9 years, the rent varying from 30s. to 50s. per hectare, which is always paid in money. According to the official tables, 3,000 hectolitres of corn were harvested in 1835, exclusive of 682,000 hect. potatoes, the cultivation of which is increasing on the small farms. A good deal of cider is made, and most of the peasants' cottages are surrounded by small orchards. Cattle, horses, and sheep are all of good breeds, and are, in fact, among the best in France: produce of wool is estimated at about 650,000 kilogs. *wool*. Wages are high. Farm servants always live with their masters; and ploughmen receive from 8s. to 10s. sterling a year; women from 2s. to 6s., generally in *key*. Their food consists of bread, vegetables of all kinds, soup, eggs, cheese, &c., with cider for drink; and *cherry*-meat once or twice a week. The occupiers of the land are prosperous, though not rich. The farmer pays land, house, window, and personal taxes, and is frequently called on for the support of paupers. The latter are numerous, and as no legal provision is made for them, they are wholly dependent upon voluntary contributions. (*See Rep. on Agriculture*, 1834.) This *dép.*, which is the third in France with respect to pop., is inferior to none in manufacturing industry. Rouen (which see) is the head of the cotton manufacturing towns; and *Caen* is one of the chief seats of the French woollen manufactures. Manufactures of most other descriptions are carried on; and the *dép.* has, through Havre, &c., an extensive trade with England, America, and most parts of the world; and by the Seine, with Paris and the interior of France. It is divided into 5 *arrond.*; chief towns, Rouen, the cap., Dieppe, Havre, Neufchâtel, and *not*. It sends 11 *memb.* to the Ch. of Dep. Registered electors, in 1838-39, 7,599. Total public revenue 11,601,799 fr.; expenditure, 15,185,773 fr. (*Hugo, Seine Inf.; French Official Tables, &c.*)

SEINE-ET-MARNE, a *dép.* of France, reg. N., lying between the 48th and 49th deg. of N. lat., and 2° 30' and 3° 30' E.; having N. the *déps.* Oise and *not*; E., Aube and Marne; S., Yonne and Loiret; and W., the last-named and Seine-et-Oise. Area, 668,423 hectares. Pop., in 1846, 340,223. Surface, undulating; slope being from E. to W. The highest hills are in S. The Seine, here joined by the Yonne, traverses S., and the Marne the N. part of the *dép.* The *arrond.* of Nogent, and Grand Morin are the other principal *arrond.* The geological formations are mostly calcareous, and in many parts by a deep layer of vegetable soil. It is, indeed, one of the finest agricultural *déps.* in

France, and has a good deal of rich land. In 1834, it was said to comprise 247,834 hectares arable land, 33,398 ditto meadows, 18,973 ditto vineyards, 6,807 ditto orchards and gardens, and 79,868 ditto woods. It has a large surplus of corn, principally wheat and oats, for exportation. Potatoes are, also, pretty extensively grown. The produce of wine may amount to nearly 600,000 hectols.; but it is mostly of low quality, and is principally used for home-consumption only. Cider is also produced.

In 1819, according to Mr. Jacob, this *dép.* was better cultivated than those more to the E.; the soil is well adapted for turnips, small patches of which are occasionally met with.

Meaux is finely situated in the midst of rich natural

about 100,000 hect. a year. The culture of figs, cherries, strawberries, and other fruits and vegetables for the Paris markets, is an important branch of industry. A good many sheep are bred, and cows for their milk, which is sent to Paris; but few other kinds of live stock are reared.

In 1835, of 317,344 properties subject to the *contrib. foncière*, 104,205 were assessed at less than 5 fr., and 608 at 1,000 fr. and upwards. The proximity of Paris has given rise to a great variety of manufactures. Yarn and stuffs of all kinds, paper, hair fabrics, leather, earthenware, beet-root sugar, chemical products, &c., are among the principal goods manufactured. The *dép.* has a very extensive general trade. It is divided into 6 *arrond.*; chief towns, Versailles, the cap., Mantes, Pontoise, Rambouillet, Etampes, and Corbeil. It sends 7 *memb.* to the Ch. of Dep. Registered electors, in 1838-39, 3,400. Total public revenue, in 1831, 23,036,434 fr.; expenditure, 12,908,713 fr. (*Hugo; French Official Tables, &c.*)

SELBY, a market town, river port, and par. of England, W. Riding, co. York, chiefly in Barkston Ash wapentake, on the Ouse, 11 m. S. by E. York. Area of par. 3,160 acres. Pop., in 1841, 5,276. The town is pretty well built, paved, and lighted, and has latterly been much improved. A handsome Gothic market-cross, the par. church, and the town hall, a neat brick edifice built in 1825, are the principal public buildings. The church is a portion (almost the only one remaining) of Selby Abbey, founded by William the Conqueror in 1069, in which Henry I. was born. It is a large and magnificent cross church, of mixed Norman and early English architecture. The choir is a most beautiful specimen of decorated work; the E. end is peculiarly fine, with very beautiful windows, and octagonal turrets, having rich pinnacles. It has some very superior stone screen-work, and ancient stained glass. (*See Selby's Gothic Architect.*) The living, worth 571 *l.* a year, is a perpetual curacy, in the diocese of York, in private patronage. Selby has meeting-houses for Friends, Independents, Calvinists, Wesleyans, Unitarians, and Rom. Catholics; a grammar-school founded by Edward VI., a hospital for seven poor widows, &c. The Ouse, which is here crossed by a movable timber bridge, is navigable to Selby for vessels of considerable burden; and it carries on an extensive intercourse with water

he Senegal forms a part of the line of demarcation between two regions widely differing in every respect. The N., within a few miles of its banks, is the great desert of Sahara, with here and there a few Moors; to the S. are the fertile regions of Nigritia, inhabited by negroes. (*Ritter's Africa*, Fr. trans., ii. 27.; *Hugo*, art. *Senegal*; *Dict. Géog.*, &c.)

SENEGAL, a name derived from the above river, is applied to some small French colonial establishments on the W. coast of Africa, comprising several islands, and all portions of the African continent, between the Senegal and Gambia rivers. It is divided into two parts, the N. consisting of the isles of St. Louis, Bathé, Safal, and Gheber, near the mouth of the Senegal, and some few establishments on the banks of that river, and trading stations along the coast between Capes de Nord and Blanco; and the S. arrond., comprising the island of Goree, Albreda, on the bank of the Gambia, and the other stations S. of Cape de Verd. The total number of these dependencies amounted, in 1836, to 18,040; of whom about 18,000 were Mohammedans and blacks: the remainder of the pop. inhabited St. Louis and its arronds. This part of the African coast is nearly destitute of good harbours: those of St. Louis and Goree are the best. The soil of the isles and continental shore is sandy, but improves in quality further inland, where it is covered, S. of the Senegal, with dense forests, and with most luxuriant vegetation. The climate, though so very pestiferous as that of Sierra Leone, is extremely bad. The heat of summer is most relaxing and oppressive, especially during E. winds, though the thermometer does not stand extremely high. The wet season, which lasts, with S.W. winds, from June till Oct., is particularly fatal to Europeans, who are attacked with enteric, liver complaints, and various kinds of fevers. The mineral products are few. There are traces of iron, but little ore is wrought. Basalt, &c., are found on Goree, but scarcely any stone elsewhere; and at St. Louis, the most solid buildings are only of brick. Wood is procured from the countries towards the head of the Senegal, but the efforts of the French to form settlements there have hitherto proved abortive. Near the mouth of the Senegal are some salt-pans, and in some parts of the interior natron effloresces on the soil. The vegetable products are the most varied and abundant. They include the gigantic baobab (*Adansonia digitata*), palms, mimosas, and gum trees of numerous kinds, Senegal ebony, and other valuable timber; with cotton, indigo, coffee, arnatto, olives, hemp, and other fibrous plants; cassia, sweet potatoes, millet, maize, &c. Among the wild animals are the elephant, lion, hippopotamus, wild boar, buffalo, tiger-cat, great numbers of deer, game of all species, and an immense variety of birds and reptiles. Oxen, buffaloes, horses, asses, &c., are used for domestic service, as in Europe; and goats, sheep, and hogs are reared. Several kinds of artificial grasses are grown, but the culture of products for food, or exportation, is pursued only to a very small extent, Senegal being a trading entrepôt rather than an agricultural colony. Few of the colonists are employed in manufactures, except in the working of iron, and ship-building. The making of bricks, lime, and salt, employs few hands: the negroes weave such clothes as they require, but other manufactured articles are obtained from Europe. We subjoin an

account of the Quantities and Value of the principal Articles exported from the Senegal Colonies in 1836:—

Articles.	Quantities.	Value.
Raw hides . . . kilogr.	227,728	295,468 £.
Wax . . . —	45,134	90,268
Elephants' teeth . . . —	12,248	85,323
Gum Senegal . . . —	1,791,510	2,524,694
Cabinet-woods . . . —	40,509	14,178
Gold . . . grammes	50,225	150,675
Specie . . . —	—	74,800

The total value of the exports, including that of goods re-exported, amounted to 4,051,268 fr.: the imports to 1,961,894 fr., the principal being linen and cotton fabrics, soap and apparel, brandy, liqueurs, wines, and other provisions.

Senegal is governed by a superior naval officer, who resides at St. Louis: Goree is the seat of a lieutenant-governor. There appears to be neither a representative assembly, nor a colonial council. A court of primary jurisdiction sits at St. Louis; from the decisions of which, appeal lies to a court composed of the governor, the other chief functionaries, and certain principal inhabitants of the colony. The European force in Senegal consists of half a battalion of marines, a comp. of marine artillery, and a comp. of sappers, &c., altogether amounting to about 370 men. The French established themselves here in 1637, but no settlement of much importance was made till the formation of the Senegal Company in 1664. The English took Senegal in 1756, but it was re-

taken by the French in 1779: it was again held by the English from a period shortly after the French Revolution till the peace of 1814. (*Hugo*, art. *Senegal*; *Etats des Colonies Françaises*.)

SENLIS (an. *Augustomagus*, post *Sylvanectis*), a town of France, dép. Oise, cap. arrond., on the Nonette, a tributary of the Marne, 29 m. S.E. by E. Beauvais. Pop. in 1846, 5,302. It stands on the declivity of a hill, and consists of the town proper, and three suburbs. The town is surrounded with thick walls, parts of which are supposed to be remains of those constructed by the Romans. It is tolerably well-built; but the streets are mostly narrow and crooked, and it has few public buildings worth notice. The cathedral, however, has a handsome spire, 225 ft. in height. Chicory, starch, and cotton thread, are the principal manufactures. The town was of importance in the middle ages: under the Carlovingians it had the right of coinage; and in 1180, Philip Augustus espoused Elizabeth of Hainault at Senlis. (*Hugo*, art. *Oise*, &c.)

SENS (an. *Agedinacum*, post *Senones*), a town of France, dép. Yonne, cap. arrond., on the Yonne, 30 m. S.E. Auxerre. Pop., in 1846, inc. com., 10,018. It is surrounded with decayed walls, attributed to the Romans, and various Roman antiquities exist in and round the town. It is said by some authorities, but not by others, to be well laid out and well built; and is kept clean by streamlets, which traverse its principal thoroughfares. It has a fine Gothic cathedral, of the same proportions as Notre Dame, in Paris, though of less size. In it is the splendid marble mausoleum of the dauphin, son of Louis XV., and father of Louis XVI., Louis XVIII., and Charles X., a *chef-d'œuvre* of Coustou. In the chapter-house is a painting of the death of Thomas-à-Becket, who took refuge at Sens about 1106. The communal college is a large building, with a museum of antiques, and a public library of above 6,000 vols. Sens has a seminary, some public baths, a handsome theatre, a court of primary jurisdiction, &c.; manufactures of serge, druggists, wax candles, and glue, with breweries and distilleries; and an active trade in agricultural produce, timber, oak bark, leather, bricks, &c. Under Valens it was made the cap. of the 4th Lyonnaise; and it became an archbishopric on the establishment of Christianity in the empire. Several councils were held here in the middle ages, including that in 1140, at which Abelard was condemned for heresy. (*Hugo*, art. *Yonne*; *Guide du Voyageur*, &c.)

SERAMPORE, one of the Danish settlements in Hindostan, prov. Bengal, consisting of a town on the Hooghly, about 12 m. above Calcutta, and immediately opposite Barrackpoor. Pop. about 15,000. (*Malcom*.) It extends for 1 m. along the river, and is without fortifications, having only a small battery for saluting. "Serampore is a handsome place, kept beautifully clean, and looking more like a European town than Calcutta, or any of the neighbouring cantonments. Since the Copenhagen rupture (and more especially since it ceased to be an asylum for debtors from Calcutta), it has grievously declined, and its revenues scarcely meet the current expenses. Many persons of different nations, who like a cheaper residence than Calcutta, take houses here." (*Mod. Trav.*, ix. 110.) It has long been the head quarters of the Protestant missions in India; and has a large and handsome college for the instruction of native youths, an extensive missionary printing establishment, &c. It was here that the Scriptures were translated into various Indian dialects, under the superintendence of Dr. Carey and others. (*Malcom's S. E. Asia*, ii. 46.; *Hamilton's E. I. Gaz.*)

SERES, a large town of Turkey in Europe, in Macedonia, cap. of a beylik; on a declivity a little N. of the lake Takinos, and 44 m. N.E. Salonika. Its pop. is probably between 25,000 and 30,000; but this part of Europe is so seldom visited by travellers, that we have little accurate information respecting it. Seres is surrounded by a wall flanked with towers, and commanded by a citadel. It is said to be well built, the houses being interspersed with gardens: it has some spacious *khanes*, numerous mosques, churches, and fountains, and several public baths; with linen and cotton manufactures, and an active trade in cotton, grown in large quantities in its vicinity. Stein states that 70,000 bales of cotton are annually exported from Seres, 30,000 of which go to Vienna. (*Horschmann's Stein*, &c.)

SERINGAPATAM (*Sri-Ranga-Patana*, "Vishnu's city"), a decayed town and fortress of India, S. of the Krishna, which, under Hyder Ali and Tippoo, was the capital of Mysore. It stands at the W. angle of an island in the Cavery, about 4 m. in length by 1½ m. in breadth, and is about 250 m. W.S.W. Madras. Lat. 12° 25' N., long. 76° 45' E. The fortress, constructed by Tippoo, is an immense mass of building, but in several respects injudiciously planned. It was, however, when invested by our troops, strengthened with six redoubts, and other strong outworks. As a capital, the town was but mean. It has one good bazaar, and a broad road under

the ramparts, but the other streets have a very indifferent appearance; the houses, also, are shabby, and the public buildings few. Hamilton speaks of an arsenal, a gun-carriage manufactory, &c.; but it is probable that these, as well as the other military establishments, have been since removed to Mysore. On an eminence in the centre of the island is a large and handsome suburb, in which is the mausoleum of Hyder Ali and Tippoo, and across the Cavary, near the city, is a native bridge of granite, remarkable for its size and solidity.

Seringapatam was besieged by the English on three different occasions: the first two sieges took place in 1791 and 1792; at the latter, Tippoo purchased a peace by ceding half his dominions, and paying 3 crores and 30 lacs of rupees to the British and their allies. Another war, however, broke out in 1799; and on the 4th of May, in the same year, Seringapatam was stormed by the British and the Nizam's forces, under Gen. Harris. On that occasion Tipoo was killed, with the greater part of his garrison, amounting to 8,000 men, and the dominions of the last formidable enemy of the British in the Indian peninsula were added to our Indian empire. (*Mod. Trav.*, viii.; *Hamilton, E. I. Gazetteer*, &c.)

SERVAN (ST.), a town and sea-port of France, *dép.* Ille-et-Vilaine, on the Rance, immediately behind St. Malo, of which town it may be considered the continental suburb, though comprised in a distinct commune. Pop. in 1836, with comm., 9,948. St. Servan is well built, and has a good harbour for merchant vessels, divided into two parts by the *Solidor*, an isolated tower about 60 ft. in height. The dock-yard, which derives its name from this tower, has 5 slips, three of which are appropriated to the construction of frigates; and during the war many frigates were built here. The naval establishments at St. Servan are considerable; and a floating dock, to connect the port with that of St. Malo, is now (1841) in rapid progress towards completion. (*Ports, &c., of France*, 280, 281.) St. Servan has manufactures of sail-cloth, cordage, ship-biscuit, &c., and is the general *entrepôt* for the trade of St. Malo. Among its inhabs. are many English families, attracted thither by the cheapness of living, and the beauty of the neighbourhood. (*Guide du Voyageur*; *Hugo*; *Priv. Inf.*)

SERVIA (an. *Mæsia-Superior*, with part of *Illyricum*), one of the principalities on the Danube, nominally included in the dom. of Turkey-in-Europe, but in a great measure independent of the Porte. It extends between the 42d and 45th degs. of N. lat., and the 19th and 23d of E. long.; having N. the Hungarian provs. of Slavonia and the Banat, from which it is separated by the Save and Danube; E. Wallachia and Bulgaria, from the first of which it is also separated by the Danube; S. Macedonia, the Balkhan being the boundary line in this direction; and W. Bosnia, from which it is divided by the Ibar and the Drin. Greatest length, N. to S., about 180 m.; breadth, varying from 100 to 160 m. Area roughly estimated at 30,000 sq. m., and the pop. at about 1,000,000, mostly Christians of the Greek church. The greater part of the country is covered with mountains, those in the W. being ramifications of the Dinaric Alps, and in the S. and E. branches from the Balkhan. There are, however, some tolerably extensive plains, particularly in the N. and along the course of the Morava. This river, which, after those above named, is the principal in Servia, nearly traverses the country from S. to N. The climate is remarkably variable, and much colder in winter than would be inferred from the lat., the Danube and the Save being often thickly frozen over. The heats of summer are proportionally intense: the autumn is the most agreeable season; but ague is very prevalent then and in spring. The soil is almost everywhere fertile, though to a great extent uncultivated. Every species of grain common in Europe is raised, except rice. Maize is the principal; but much more wheat is produced than formerly, and maize bread is not now generally made use of by the inhabs. of Belgrade and other large towns. Owing to the inland situation of the country, and the want of markets, the price of corn is usually very low.

The vine is pretty generally grown; but from defects of culture, the grapes of the same vineyard usually differ greatly in quality, and being all used promiscuously in the making of wine, it is, for the most part, very indifferent. In the district of Belgrade, however, superior red wine approaching to claret has been made, though to no great extent. In fact, but little wine is drunk in Servia; a spirituous liquor, distilled from plums, called *slivovitz* or *rakis*, sold at about $\frac{1}{4}$ d. a quart, being used in its stead. Hemp, flax, tobacco, and cotton are cultivated, but only in small quantities. The pasture-grounds are extensive and good, though little can be said in favour of the breeds of cattle and sheep. Both are meagre and impoverished; and the former, though universally employed, with buffaloes, for draught, are not very numerous. The horses, also, are poor and diminutive, though latterly Prince Milosch has made considerable efforts to improve the breed. Hogs are by far the most valuable and favourite stock. No peasant's family is without these ani-

mals. They overspread the country in vast herds, being branded with the proprietor's name, and turned loose in the forests, where they feed on acorns, except in winter, when they are scantily fed at home on maize, and other dry provender. Hogs constitute the principal export from Servia: about 250,000 are said to be annually sent to the Austrian dominions, where they pay a considerable import duty, having also paid an export duty on leaving the Servian frontier. The wool of the Servian sheep is very inferior; but about 60,000 lamb and goat skins are annually disposed of to Austrian merchants.

The forests, which overspread a large proportion of the country, might, if they could be turned to good account, be made, under judicious management, an almost inexhaustible source of wealth. Oak, extremely well adapted for ship-building, ash, pine, &c. are the principal trees, and vallonea is produced in great plenty. But, as if the natural difficulties in the way of its exportation were not enough, government has prohibited the felling of oak timber! and the forests in many places are so thick as to be all but impassable, and are, at the same time, encumbered with putrescent vegetation. The collection of leeches, which abound in the marshy districts, has been carried to some extent of late years. They are disposed of to French merchants settled in Belgrade and Semlin, who forward them by way of the Danube, &c. to Paris, which they reach in 12 or 14 days: but this, which promised to become a business of considerable importance, has been monopolised by government. Iron, copper, lead, quicksilver, and coal, are found in Servia: but few or no mines are wrought; partly from a want of capital and enterprise, but partly also, it is alleged, from a wish on the part of government to conceal such tempting sources of national wealth, to avoid exciting any desire in its neighbours to possess themselves of the principalities.

Until a more extensive commerce take place on the Danube, or a free communication of some kind be established between the Upper Save and the Austrian ports on the Adriatic, the great natural resources of Servia must continue all but unavailable. Her produce being similar to that of the S. provinces of Austria and Russia, these states throw obstacles in the way of her commerce; at the same time that the adjacent Turkish provinces have no need of her staples. The want of roads is, also, a great drawback on the prosperity of all the provinces in this remote part of Europe: the only high road in Servia is that which leads from Belgrade to Adrianople.

Servia, however, is less inconvenienced than most of the contiguous provinces by the want of roads, their deficiency being, in part at least, compensated by the easy access to the great navigable rivers by which she is almost surrounded. A more liberal and bolder commercial policy on the part of Austria would do much to develop the resources and advance the civilisation of the Servians; and by attaching them to her interests, it would seem, also, to be the safest in a political point of view.

The Servians belong to the widely-spread Slavonian stock, with which most part of E. Europe is peopled. Their language is the most refined of the Southern Slavonian dialects, and their poetry ranks high among that of the E. European nations. (*See Bowring's Specimens of the Popular Poetry of the Servians.*) In their manners and customs the Servians differ little from the other Slavonic tribes in their vicinity (*see TURKEY*, &c.): they are in general almost equally uncivilised, backward in the arts, &c., ignorant and superstitious; though in some of the larger towns some degree of advance has of late been perceptible.

Servia is divided into 6 provs., and 13 districts; chief towns Belgrade, the cap., Semendria, Nissa, Jogodina, Kragajewatz, and Poschega. In the middle ages, it formed an indep. kingdom, the dominion of which extended over parts of Bulgaria, Bosnia, Albania, &c.: it was conquered by the Turks in 1365. The Turks still garrison Belgrade, which is the residence of a pacha; but nothing is left them beyond this military occupation, an acknowledgment of the supremacy of the Porte, and a small yearly tribute to the sultan. The internal government is wholly in the hands of the Servians. Early in the present century, a successful revolt took place, headed by Czerny-George, a native chief, who, in 1806, took Belgrade from the Turks, and continued to govern the country till the peace of 1814; when it again submitted to the Turks, and Czerny-George took refuge in Russia. A new revolt, under Milosch Obrenowitch, in 1815, was equally successful, and Milosch has till lately held the reins of government. He established a representative assembly, a council of ministry, &c. In 1835, a general poll-tax, to meet the state expenses, and various other financial plans, were adopted. But whether it were owing, as has been alleged, to Russian influence, or to other circumstances, Milosch was obliged to resign the government, and retire to his estates in Wallachia in 1839, since which period he has been succeeded by his second son, Prince Michael. Servia has a small standing military force of about 1,750 men, 1,500

factory, 25-carriage and 20 carting teams, but all males capable of working were enrolled in the militia, and a force of 2,000 men may be mobilized in an emergency (from Report on Province of Quebec, 2nd report on the Situation in the St. Lawrence Region in 1914).

1887, Vol. 1, p. 117. It is a very dry and hot part of the coast, the temperature, on January, on the 11th day of the day, is very warm, which renders the climate in the S. E. extremely, about 14 m. S. E. Latitude (lat. 10° 15' N., long. 7° 30' W.). Pop. according to census, 1878. It extends for about 1 mile along the beach, consisting mostly of 1 or 2 parallel narrow streets, almost all stone, and some squares, in one of which is a large public fountain. It is bounded by water partly to the north and east, and by the coast of the Pacific and the other bounded parts. It has several restaurants and hotels, some private, and many of public, several shops and a few small houses for the most part. Its climate, which is very pleasant and healthy, produces large quantities of oranges and other fruits, which, with oranges, lemons, and such are its principal articles of export. The exports of salt from the town have long been of very considerable importance and furnish to about the greater part of the demand of Ecuador, and Mexico and elsewhere. Being particularly so, certain persons in the east of this country, as I have been told, have a small factory, a few. The principal factory employs a good many hands and a large ship is built annually from the ship to the ship of July. There is a the most famous of America, in which physicians are abundant. The Dr. Contreras is supposed to have died of the epidemic disease of the day, which various rumors and reports have been found one of which, a (certain) like mentioned by a certain society in the square of the city. After the organization of the House, several were not allowed, all a day suspended under some other name and he was elected. It was killed during the day of independence in the 17th century (1880). It suffered severely from the earthquake or earthquake to which it fell. (The City, Sunday, 10 m. 1887, Vol. 1, p. 117.)

[illegible][illegible]

attention, to the Nashville family about the time of 1810-1811. It is a large, fine constructed edifice. The interior which is easily furnished, has various pictures by celebrated masters, and other spiritual works of art. Sermons are by no means infrequent, there were sermons every six weeks to the society, but they no longer exist. The town is governed by a council, a mayor and city trustees, chosen at an annual court held. Fair, auctions and bazaar are held at the Crown Hotel on the last Saturday in every month, and a court of sessions is held on the first Friday of each month. Sermons by the town of a free school. Markets on Saturday, fair, July 16 and Oct. 18, for hogs and poultry, and the 26 Tuesday in every month for cattle.

The River of England being inferior only to
 the Rhine in magnitude, and perhaps also in impor-
 tance. It has its source in a small lake on the eastern side
 of Friesland, in the province of Groningen. At its
 mouth it is called the Maas, the name by which it is
 known in whole extent. It was known to the Romans. It flows
 first towards the N. E. and afterwards turns to the S. E.,
 so it approaches the sea. Where it takes the name of
 the Rhine, it flows through the vale of Hainault, its
 course is almost due N. W. entering the great plain of
 the Camp beyond Valenciennes, it turns abruptly to the S. E.,
 and pursuing the same direction, it stream enters
 the city of Namur. Flowing through Louvain, Dinan, and
 passing Brabant, it follows a southern course as it
 leaves the city, and enters the province of Flanders.
 Being now become a broad and deep river crowded with
 barges, it rolls through a pleasant country in a tranquil
 course, passing the city of Valenciennes and traversing the
 Vale of Hainault and Ghent. In the year 1666,
 when this river overflowed, one of which covered the walls of
 Ghent. Not being again raised, it forms a great
 artificial river. Its course from Valenciennes to the Point is
 uniform. From the latter it flows N. W. till it approaches
 the mouth of the Scheldt, where it ceases to flow and turns
 off to the S. E. into the Atlantic Ocean.

The Severn, particularly below Otterhampton, has frequently overflowed its banks, and occasioned much damage to the surrounding country. It is remarkable for the fish, which catches in with a hand net, a trawl, and a hand seine. Then, we doubt, arises from the wide expanse of the waters of the Atlantic in the Bristol Channel being constantly renewed, all in length they are found swimming up the river. Towards the Bristol Channel spring eels run from 15 to 20 and 30; but in King's River, at the mouth of the Laver, even they rise to the height of 40 lb. and sometimes more; and at Chertsey the run is 20 lb. There is nothing remarkable for the Severn Channel. The population which the current from the sea brings with from the narrow mouth of the river occasions that dashing and grinding of the waves known by the name of *hove* or *eggs*.

The Service is supplied from Fawcett's Lighthouse, where it keeps itself in the Service Hospital at Wootton Bassett, a distance of about 70 m. and its navigation is controlled by the Montgomery Light House. It is, consequently, of the highest importance as a channel of internal communication. Its capacity in this respect being materially increased by its numerous large tributary streams, and by the simple and reliable fact that it is the source of the latter a continuous large share of the commerce of Birmingham, and of the rapidly growing towns of South-Staffordshire, Wolverhampton, &c. and to assist with the Tame and the Severn, the River Pump Works in the city to keep a constant fall of 10 ft. (Preceding an Indian Navigation Co. Bill.)

The operation of the barge from New Point to Channahon is both complex and difficult. To obtain this transportation, a contract on a large scale has been let from Southern P.D. to Channahon. It is 140 to 150 barges from 10 to 20 ft. in width and from 16 to 18 ft. in depth and may occasionally be required to transport up to 100 tons. There is a basin at each end for the accumulation of barges. The wharf which was opened in 1907 has become the channel of all vegetable shipments, and Channahon is now taking an important part in trading and shipping work. See Channahon.

The largest which occupies the bottom are about 100 ft. in length, from 10 to 20 in breadth, and 1 to 2 deep. They carry about 100 tons. The trunks are from 60 to 70 ft. long, 20 broad, and 6 deep, carrying 75 tons. They carry a square-rail, and have a mainmast and foremast.

and of the poss. of the new army, in a state and fruitful

plain on the Guadalquivir crossed here by a bridge of boats, 62 m. N.E. Cadiz, and 212 m. S.E. Madrid. Lat. 37° 23' 50" N., long. 6° 47' 47" W. Pop., acc. to Miffano, 91,360. It has numerous suburbs, but the city proper is about 4 m. in circuit; enclosed by a line of circumvallation 13 m. in circ. The ancient suburb of Triana is on the right bank; but with this exception, Seville lies wholly on the E. side of the river. "The streets, with a few exceptions, are narrow and crooked, some of them being so contracted that one may touch both walls at the same time. Few are wide enough for carriages; and many through which coaches pass, show, by the deep furrows in the walls, that one nave touched, and often both at the same time." (*Townsend's Spain*, ii. 215.) The street or place, called the Alameda, in the centre of the town, planted with elm trees, is, however, very magnificent; being 600 yards in length, by 150 in width, decorated with 8 fountains, and with statues of Hercules and Julius Caesar. And since Mr. Townsend's time various improvements have been introduced; old streets have been repaved, obstructions and irregularities removed, and numerous modern wide streets built in straight lines with regular and handsome houses. On the whole, however, Seville has all the peculiarities of a Moorish town, and furnishes a good specimen of the architecture of the Moors in their streets and houses, the former of which, narrow, close, and dirty, appear in strange contrast with the extensive and airy mansions that open on them, neatly white-washed, and studded with numerous windows, each having its cool-looking, green Venetian shutters. The *Paseo* and the *Delicias* are the principal public walks, and perhaps in point of rural beauty are superior to any in Spain. The former is here what the *Prado* is in Madrid; and in it the pop. may be studied to the best advantage. Among the public buildings are 31 churches, including the cathedral, numerous large edifices formerly conventual, but many of which have lately been turned into manufactories; an exchange, guildhall, 10 hospitals, one of which is military, an asylum for decayed priests, 8 sets of barracks, 7 prisons, and 2 theatres.

The cathedral, built in the 14th and 15th centuries, occupies the site of a Moorish mosque; but it seems highly probable that it was a Christian church prior to the Mohammedan conquest. It has 5 naves, but no dome or central tower. It is, according to Townsend, 420 ft. in length by 263 ft. in breadth; the height from the floor to the roof being estimated at 126 ft. "The cathedral," says Mr. Swinburne, "is more cried up than I think it deserves; it is by no means equal to York minster for lightness, elegance, and Gothic delicacy. The clustered pillars are too thick, the aisles too narrow, and the choir, by being placed in the centre, spoils the whole coup d'œil, and renders the rest of the church little better than a heap of long passages. The ornamental parts are but clumsy imitations of the models left by the Moors. Not one of the great entrances or porches is finished; and to disfigure the whole pile, a long range of buildings in the modern style has been added to the old part." (ii. 23.) The only remaining parts of the mosque are the Giralda, or belfry, and the great gate of the cloisters, the latter of which is a fine specimen of the best style of Moorish architecture.

The most admired feature in the whole cathedral, however, is the *Giralda* (weathercock), a brick tower 268 ft. in height, and exactly square, each side being 50 ft. in breadth. This is surmounted by 4 smaller towers, which are crowned by a small cupola, the whole terminating in the *giralda*, which gives its name to the tower, a colossal bronze statue of Faith, bearing a flag and palm-branch, 14 ft. in height, and of great weight, but so delicately poised as to turn with the slightest variation of the wind. The height from the ground to the top of the statue is said by Miffano to be 264 Span. feet. The ascent to the top of the great tower is by an inclined plain, so gradual that one may ride up without inconvenience; the view from the summit is superb, extending over the entire plain. In point of riches, this cathedral ranked second only to that of Toledo. It had, also, with the church of the Capuchins, and the chapel of the hospital *de la Caridad*, some noble pictures by Murillo; but, though some of these have been preserved, others have become, either by purchase, or the right of conquest, the property partly of private individuals, and partly of Marshal Soult, and other French generals.

Some of the Castilian monarchs are buried within the cathedral; but, as Bourgoing has observed, these tombs excite no emotions compared to those excited by the sight of the slab, in front of the choir, which once covered the remains of COLUMBUS. It is inscribed, *A Castilla y Aragon otro Mundo dio Colon*—To Castile and Aragon Colon (Columbus) gave another world. A sublime and not too ambitious an epitaph. We may add, that the remains of Columbus, after reposing here for about 80 years, were carried across the Atlantic, and deposited in the cathedral of St. Domingo: but, in 1795, on the capture of St. Domingo by the blacks, the ashes of the illus-

trious dead were again raised by the whites, and carried to the Havannah, where they are now deposited. It is worthy of notice, that the library belonging to the cathedral was begun in 1560, by the bequest of 20,000 vols. left for the purpose by Hernando, one of Columbus' sons.

The large organ, which is considerably larger than that of Haarlem, has altogether 5,300 pipes, with 110 stops. "Nothing," says Inglis, "can exceed the majesty of the music awakened by this organ, and, at times, the effect is almost too overpowering for human senses." (*Inglis*, ii. 57, 58.; *Cook's Sketches*, i. 122. and ii. 93—96.)

Immediately under the Giralda, occupying one side of a small square, is the archbishop's palace, with a handsome front, and opposite to it is the *Lonja*, or exchange, a quadrangular edifice, with a central *patio*, comprising apartments, some of which are still used by the merchants, though the greater part has been converted into an *Archivo de los papeles de Indias*, or repository for American archives; the voluminous records here preserved being as carefully placed and ticketed, as if Spain still continued to give law to her *ci-devant* transatlantic possessions! The floors are laid in chequered marble; and the grand staircase is of highly polished red marble, and remarkably handsome. (*Scott's Roads and Granada*, ii. 106.) A little removed from the Lonja is the Alcazar, a royal palace and gardens, said to have been constructed in imitation of the Alhambra, principally by Peter the Cruel and Charles V. Swinburne correctly terms it, "a pasticcio of Saracenic, conventual, and Grecian architecture." The exterior has a miserable appearance; but the first court, after entering the gate, has a grand effect. It is 98 ft. in length, by 69 ft. in breadth, flagged with marble, and surrounded with a colonnade of white marble Corinthian pillars, of handsome proportions, and well executed, the walls behind being covered with grotesque designs in the Moorish taste. Next to the Court of Lions, in the Alhambra, this court is perhaps the best piece of Arabic building in Spain for execution and delicacy of design, though the ornaments of the palace in Seville be much inferior to those of that in Granada. The Alcazar comprises a suite of 78 successive apartments, having carved ceilings, with walls, like those of the Alhambra, with well-preserved arabesques. By far the most splendid, however, is the Hall of Ambassadors, a splendid apartment, adorned with designs in stucco, and with a floor of variegated marble. Within the Alcazar are many fine paintings, by Murillo, Velasquez, Luis de Vargas, and other Spanish masters, with a few specimens of the Italian school; but several of the best pictures have, within the last few years, been removed to the public gallery at Madrid. A considerable portion of the palace is now let out in lodging-houses, and to private individuals; the portion reserved for the sovereign comprising only a small section of the entire pile. The gardens, which are of small extent, are laid out according to the Moorish taste, in formal alleys, with chipped myrtle hedges and trees, cut to resemble warriors armed with clubs. The walks in some parts are laid with tiles, through which *jets-d'eau* are made to flow, which, by turning a screw, suddenly water not only the garden, but its unwary visitors. The *Casa Pilata*, another of the sights of Seville, is a private house, said to have been built on the exact model of that of the Roman governor of Jerusalem! Within the city, also, are many structures of Roman origin, which still show traces of their former magnificence. The octagon tower, or *Torre d'Oro*, was probably built by one of the Cæsars. The *Calles de Carmona*, a Roman aqueduct of 410 arches, still conveys water to the city from Alcala; and the gates, especially that of Triana, are very magnificent, though of equally ancient origin. Most of the other objects worth notice are without the walls. The first in order is the *Plaza de los Toros*, or circus for bull-fights, half wood and half stone, and capable of accommodating 14,000 spectators.

The next remarkable object is the royal tobacco manufactory, a huge edifice 440 ft. in length by 269 ft. in breadth, so strongly built and guarded by walls and ditches, as to appear like a fort or citadel, raised to overawe the citizens. It employs about 400 hands, of which more than a half are engaged in making cigars. But, despite all the precautions of government, fully nine tenths of the cigars made use of are said to be clandestinely imported. (*Scott*, ii. 110.) The cannon-foundry is, on the whole, a creditable national institution, though not at present in any great activity. Among the other public establishments, may be specified the cavalry barracks, royal saltpetre manufactory, military hospital, &c. The market-place is large, and admirably suited to its purpose, the buildings being arranged in streets, an open space surrounding the whole, with gates and ornamental fountains. In the suburb of Triana is a separate market for the supply of the *gitanos*, or gypsies, its chief inhabitants.

The arrangement of the streets is very different from

that desirable to most other Spanish towns, and to realize the effect of the hot climate. To a similar extent may be traced the internal arrangement of the houses. They are built almost uniformly in the form of a square, with a spacious court-yard, or patio, frequently paved with marble, and surrounded by passages opening on the apartments of the ground-floor, the exterior as well as every other part of the house being kept carefully whitewashed, the massive green wooden blinds of the windows being kept closely shut during the day. In addition to this, the rooms, which are usually paved with tiles, are furnished with ponderous ottoman-chairs half a foot thick, kept shut till the sun is off the windows, when they are partially opened to admit the breeze. Hence the houses are so very dark, that visitors at first with difficulty distinguish the furniture. The entrance may also be said to divide the houses into two distinct parts.

During the winter months (commencing in Oct. and ending with April) the family inhabits the upper parts of the house, which are then thinly settled, and the rooms artificially heated by burners of charcoal, but when the hot weather sets in, these apartments are shut up, and a general move is made to the ground floor, which, being considerably cooler, and opening on the pure winds of the hot more comfortable. It is a pretty sight, indeed, says Sir A. C. Brooke (*Treatise on Spain and Morocco*, l. 35), "to wander during the delicious moonlight evenings of summer along the fashionable streets of the city, and nothing can be more strikingly brilliant than the appearance of the houses and hotels of the nobility and wealthy classes. On looking through the railings from door opening to the street, you perceive the marble paths brilliantly illuminated, well furnished, and with pictures suspended from the marble columns of the arches. An evening forms a delicious reading by night as well as by day, and converts the space below into a garden and bany arbours, in the centre of which different groups of men stand forth from a marble fountain, both cooling the air, and watering a variety of exotic, herbaceous plants, surrounded around in flower-pots. Here the young ladies of the family may be seen enjoying the coolness of the evening engaged to work, discussing themselves with music and singing and visiting the visits of their friends." These summer haunts are truly beautiful; and even to tribes given up of them become empty shells, as, for instance, in the contemplation of shade, for which taste and how stands are pretty generally substituted by all classes.

The aspect of the pop. of Seville differs greatly from that of Madrid. Even in the upper ranks, there is something to the look of an eastern appearance. They are more frequently retted, their cheeks often tinged with a line of bluish blood, and, along with the fire of a Castilian eye, there is mingled a shade of Oriental softness. Among the lower orders of the women, also, in among the Moors, may be remarked an extravagant and tasteless profusion of gaudy ornaments, immense ear-rings and bracelets, enormous rings, &c. ; and the dress of the

Andalucía counted its being also every art interest, and still looking a host of its exertions, really prove one of the a little all tending to and if he procure in Andalusian middle in better the new their their and health and Andalusian through it! provinces, clients are being fed. being perhaps more correct in such a regard. The contrast still between Andalusian and Castile is still further characteristic from the state of society in the two provinces. The furniture of Seville is quite different from that of Madrid, the former being at any rate more animated if not more intellectual and the designs helped out with words, dancing barbers and other amusements, independent of more rich and and perhaps. Balls and suppers are reserved for great occasions, but certainly substantial entertainments are more general than in the capital, perhaps because wealth is more generally diffused. Miracles are at a very low ebb.

The dawn, the sun, the wind have changed;
 Strange music of harpings the human creature,
 The blood these pulses with their memory's words,
 The love that's death, the love's eternal words,
 The love, the love, the love's eternal words,
 And young-eyed Love's words have midnight words,
 And with the dawn of words of words,
 It is the love that's death, the love's eternal words.

In *Don Quixote* it is almost a derision to a married woman to have no servants, and a jest against a collector not to have her own man. Indeed, the gallantries of the latter are not infrequently carried quite as far as the intrigues of the former. (*Don Quixote*, II, 10-41.)

But with all this corruption, the course of society runs smooth. Jealousy appears not to disturb the ménage, the parties living together with all the outward show of mutual esteem, and reliving the history of their private bickerings only to their most intimate friends. The uppermost of the middle and higher classes consist of the daily promiscuous on the *Panoré* or *Alameda* (the Hyde Park or Regent Street of London), theatrical entertainments, of which they are passionately fond, and so mean judges, and the taverns, which are so arranged as to favour each other in the arrangements of the day. The lower classes are fond of dancing, but of music they have little knowledge, for nothing can well be more disagreeable than their noisy gutters. (*Scott's Novels*, B. 126-128, and *forth. etc.*)

Soñito, as a place of residence for a stranger who cares only for sensual gratifications, is perhaps preferable to any other Spanish city. It is said that there is not a day throughout the year in which the sun does not shine on Soñito. Winter is scarcely felt, and if the heats of summer be oppressive, as they truly are during the prevalence of the scheme the storms, however, and economy of life are admirably adapted to lessen their influence. The surrounding country, with its orange and lemon groves, amanas, and other flowering trees and shrubs, is all that one can desire. Fruits of many varieties and choice fowls may be had almost for nothing and every necessity of life may be procured in abundance and at very moderate rates. Cane, fruit, and vegetables are excellent, and the bread (brought to market from the neighbouring village of *Alcala de Panderos*) is said to be the best in Spain. Meat is reasonable, but of rather indifferent quality.

Soyle has several establishments for the promotion of learning, science, and general education; but of these few, if any can be considered as very efficient. Its university, founded in 1806, is in the most backward state possible. The other educational establishments comprise a school of medicine, two mathematical schools, a college of agriculture, and an academy of the fine arts, besides the others, though damping school of St. Elmo for navigation and gunnery. Soyle has also several societies for the promotion of different branches of literature and science, but they exercise little influence, owing to the general want of sound elementary education.

If we might believe the stories which book-maker after book-maker has repeated, writer after writer, of the former flourishing state of manufactures in Saville, we should certainly conclude that in the 14th and 15th centuries it was decidedly superior as a manufacturing town, to what Manchester now is! It is said, for example, to have had, in 1340, 14,000 silk looms, and 150,000 persons employed in the various branches of the silk manufacture. Such a statement carries absurdity on its face, and Captain has shown conclusively from the letter of the Venetian ambassador, Messagero, who visited Saville in 1583, and otherwise, that it is doubtful whether it had then a dozen silk looms, and that, instead of being a city with some 500,000 or 600,000 inhabitants, as must have been the case had it had 150,000 engaged in the silk trade only, there is no reason to think that it was then larger or more populous than at present. (Quinn)

p. 17. Sec. 1. It is true that at a subsequent manufacture are attained to considerable limits, there being, in 1880, about 3,000 looms in use. The manufacture has since increased, but in the earlier part of history it employed about 3,000 looms, or, to the loss of the animal markets, in the backward state of the country for many years back, the number of looms is at present reduced to from 500 to 600. Coarse woollen cloths are made in considerable quantities, but they are both inferior to, and much dearer than similar English fabrics. There are several large tanneries, manufactures of hats, coats, northwovens, &c. but, as in the rest of Spain, the processes are so clumsy that, speaking generally, all manufactured articles are of inferior quality. The to-

enclosed by a substantial brick wall, has been greatly extended and improved during the last 25 years, at an expense of above 1,000,000*l.* sterling. It has every convenience for the building, repair, and fitting out of ships. It comprises a wet dock or basin of about 3½ acres, capable of accommodating 10 sail of the line, and in which they may take on board their stores, ammunition, and provisions, and be, in all respects, equipped ready for sea. Three dry docks, each suitable for the accommodation of a line-of-battle ship, have been constructed on the E. side of the basin, and open into it. It has also very extensive storehouses, with mast-houses, mast ponds, and slip, smithery, and artificers' workshops of every description; with handsome residences for the commissioners, port-admiral, and other officers of the establishment. The principal offices of the ordnance department were, a few years since, removed to Chatham, and the area formerly occupied by them has been added to the dockyard. The wharf wall, on the S. side of the basin in front of the mast-house, is 100, and that on the river front 60 ft. in width, lined on both sides with granite. Numerous convicts are employed in the dockyard and on the hulks, chiefly in the improvement and repairs of the former.

Sheerness, which so late as the time of the Commonwealth was a mere swamp, was fixed upon after the Restoration as an important position for a fortress. The works, however, were still incomplete when the Dutch, under De Ruyter, in 1667, took and destroyed the fortress and the shipping. (*See CHATHAM.*) The fortifications were afterwards constructed on a larger scale; numerous batteries of heavy artillery were planted on both banks of the river. The dockyard was begun early in the last century. The mutiny of the fleet at the Nore, in 1798, threatened the town and dockyard with destruction, which, however, was happily averted. (*Encyc. Brit., new ed., art. Dockyards; Hasted's Kent, &c.*)

SHEFFIELD, a parl. bor., market-town, and par. of England, cap. of the district of Hallamshire, W. Riding, co. York, upper div. of wap. Strafforth and Tickhill, at the confluence of the Don and Sheaf, the former of which is crossed by three and the latter by two bridges, 89 m. S. Leeds, and 140 m. N. by W. London. Area of parl. bor. and par., which are co-extensive, 22,830 acres: pop. of par., in 1801, 45,755, in 1831, 91,692, and in 1841, 111,091. Pop. of Sheffield township in 1831, 59,011; in 1841, 68,186. The town, originally confined to the slope of a hill rising S.E. from the Don, is now nearly 2 m. in length by 1 m. in breadth, and occupies the bottom and sides of several low hills, rising in various directions both from the Don and Sheaf, the whole being well-paved and flagged, lighted with gas, and abundantly supplied with water. The older streets are steep, narrow, and singularly irregular; but the more modern streets are wide and straight, lined with good brick houses, and many of the shops are but little inferior to those of the metropolis. The smoke, however, proceeding from the numerous steam-engines, forges, and factories, gives the town a dingy, mean appearance, contrasting strangely with the extreme beauty of the surrounding country, embellished as it is, in every direction, by the numerous villas of the opulent bankers, merchants, and manufacturers of Sheffield. The market-place occupies a wide open space in the High Street, and near it are the par. church and principal inns: it is of modern construction, and comprises large shambles, and other accommodations. The corn-exchange, also, is a handsome modern building, comprising excellent accommodation for those frequenting the markets. The cutlers' hall in Church Street, belonging to the ancient corporation of cutlers, is a handsome stone building, with rooms for the transacting of corporate business, public meetings, dinners, &c. The par. comprises 12 churches, 7 of which are in the town, and the rest in the rural townships, the patronage of all, except two, belonging to the vicar, though the appointment of the four assistant clergymen at the par. church belongs to the 12 burgesses, or chief inhabs. of Sheffield. The mother church of the Holy Trinity is a noble Gothic structure, about 240 ft. in length by 130 ft. in breadth, and from its centre rises a tower surmounted by a lofty spire, of handsome proportions: the part now used for divine service, which excludes the ancient chancel, was rebuilt in 1800, and is fitted up in a solid and handsome manner, with accommodation for upwards of 2,000 persons: in the chancel are some curious old monuments, and a fine bust of the late vicar by Chantrey. St. Paul's, in Norfolk Street (erected by subscription in 1720), is a rather heavy Greek structure, with a tower surmounted by a dome, and a cupola of cast-iron. St. James's, near the par. church, also of Grecian architecture though small, is well arranged, and at the E. end is a fine stained glass window, representing the crucifixion. St. George's, on an eminence, at the W. extremity of the town, erected, in 1824, at an expense of 15,120*l.*, chiefly defrayed by the parl. commissioners, is in the later English style, and has a lofty square embattled tower, crowned with pinnacles. St. Philip's,

near the infirmary, and St. Mary's on the S.E. side of the town, are in a similar style, and equally handsome, both having been erected, like St. George's, at the expense of the parl. commissioners. St. John's is a still more modern building. Besides the churches, which have accommodation for upwards of 15,000 persons, there are twenty places of worship for different denominations of dissenters. Six of these belong to the Wesleyan Methodists, and are among the largest buildings of the town: the Independents have six large places of worship, and there is a handsome Roman Catholic chapel. Most of the places of worship have attached burial grounds; but the custom of interring the dead in the town will probably grow into disuse, from the opening of extensive cemeteries. Connected with the various places of worship are numerous Sunday-schools, furnishing religious instruction to about 11,000 children, fully 4,000 of whom are taught by the Wesleyan Methodists, here a numerous and intelligent body. Three national schools are attended by 500 boys and 650 girls; 4 Lancastrian schools (one of which is supported by the Wesleyans) by 750 boys and 400 girls, and 7 infant-schools by upwards of 1,000 children of both sexes. The out-townships have also numerous Sunday-schools, with 8 national and 3 infant schools. A grammar-school, founded in the reign of James I., has an endowment of about 140*l.* a-year, 3-5ths of which are paid to the head-master and 2-5ths to the usher, both of whom receive entrance-fees, and other extra-payments, from the pupils. The management of the school, and the appointment of the masters, is vested in the vicar and 12 burgesses of Sheffield. A school of design, under the patronage of government, has also been established. A charity-school, established in 1796, provides clothing, board, and instruction, with an apprentice fee for 90 boys, and a similar establishment for 70 girls was formed in 1786. A collegiate school founded a few years ago on a joint-stock principle, is well attended; and more recently, the Wesleyan body have established a proprietary school, in which 300 boys are boarded and liberally educated, partly with the view of providing for the better elementary instruction of the future ministers of that denomination. Among the many charities belonging to the par. of Sheffield, the principal is Lord Shrewsbury's Hospital, for 20 men and the same number of women: the buildings, which have been erected on a new site, consist of a centre and wings, in the later English style. Hoell's Hospital, a similar establishment founded in 1703, is endowed with funds for the support of 16 widows of cutlers, and a small charity-school. There are numerous minor charities, apprentice-funds, &c. in the town, and each out-township has its separate charities. (*See Char. Com. 17th and 32d Reports.*)

The general infirmary, which stands about ¼ m. N. from the town, is a handsome stone building, with semi-circular wings and a central portico, its interior comprising many large and airy wards, with accommodation for about 200 in-patients. Adjoining, but distinct from the infirmary, is a large building, containing fever wards. The medical and domestic arrangements are complete; and, on the whole, it is one of the best-regulated provincial hospitals in the kingdom. It was opened in 1797, having cost above 20,000*l.*, raised by subscription. Sheffield has, also, a general dispensary, with lying-in charities, Dorcas societies, provident institutions, a large auxiliary Bible society, and various religious associations connected both with the established church and the several bodies of dissenters. A theatre was built in 1762, with attached assembly-rooms; and there is a handsome music-hall, in which concerts are frequently given.

A public subscription library in the music-hall is supported by 200 subscribers; the library attached to the mechanics' institute contains about 3,000 vols.; the literary and philosophical society (established in 1822) has a good collection of minerals, fossils, plants, &c. with apparatus for experiments; and the botanical society has a garden comprising 18 acres, tastefully laid out, and a glass conservatory, 360 ft. in length, filled with rare exotic plants. There are likewise two well-supported news-rooms, one of which, in High Street, has a handsome frontage, and a lofty elegant saloon. The chief commercial buildings are the post-office, excise-office, and assay-office, erected in 1773, soon after the rise of the silver-plating trade. Sheffield has also a savings' bank, 4 joint-stock banking companies; and 4 weekly newspapers.

Little is known of the early history of Sheffield, or of the origin of that business for which it is now so famous. But it had attained to eminence in the making of knives so early as the 13th century; for Chaucer, contemporary with Edward III., mentions, in his *Rever's Tale*, the Sheffield "thwytel," or whittle, in such a way as shows it was then in common use. It does not appear ever to have lost the reputation for cutlery it had thus early acquired. In 1575 the Earl of Shrewsbury, lord of the manor of Sheffield, sent to his friend Lord Bar-

high "a case of Hallamshire whittles, being such from as his pore country a Burdeth with fane through-out the realm." (*Metal Manufacturers, Cabinet Cyclop.*, B. I.) In 1834, a corporation was formed for the "good order and government of the makers of knives, scissors, shears, sickles, and other cutlery-ware in Hallamshire," the government being vested in a master, 3 wardens, 6 searchers, and 34 assistants, consisting of freemen only. The principal object in the formation of this corporation seems to have been the regulation of the marks or other device which every individual was to strike or impress on the goods he made for sale. But these regulations can hardly be said to be any longer in operation.

The corporation continued on the footing fixed in 1834, till 1854, when an act was passed, permitting all persons indiscriminately, without their being freemen, or having served an apprenticeship, or obtained a mark from the corporation for their goods, to carry on business anywhere within the district of Hallamshire. This liberal and judicious measure has been of great service to the town, by inducing men of talent and enterprise, from all parts of the country, to settle in it, where their competition and industry have had the best effects.

For several centuries the manufactures of Sheffield were confined almost entirely to the making of sheath-knives, scissors, sickles, and scythes. About the beginning of the 17th century, a common tobacco-box and the Jew's harp were added to the list of manufactured articles; but it was not till about forty years after that the manufacture of clasp-knives, razors, and files, for which it is now so famous, was introduced. It has been remarked, that for about a century after this period the manufacturers discovered more of industry and perseverance than of enterprise or ingenuity in the conduct of their business. About 1750 they began, for the first time, to carry on a direct trade with the Continent. The manufacture of plated goods was soon after commenced; and from that period down to the present time, Sheffield has made an astonishing progress in the career of industry; and in many branches of the hardware manufacture has no superior, and in some no rival. (*Rare's Cyclop.*)

Like Birmingham, Sheffield was most probably indebted to her situation for her early application to the hardware business. Coal and iron are found in her immediate vicinity. And some idea of the advantage thence derived by the town may be deduced from the fact that, in 1835, the consumption of coal in Sheffield was estimated at 510,000 tons, and that it is now (1860) supposed to exceed 800,000 tons. The Don, on which she is built, and 4 smaller rivers which flow into the Don near the town, supply her with power to work mills for forging, cutting, and preparing the iron and steel used in her manufactures, and in this respect she has an advantage over Birmingham. The river was made navigable to within about 3 m. of the town so early as 1751; and a lateral canal has since prolonged the navigation to the town.

Cutlery, as it was the earliest, so it is still the largest and most important branch of industry. The principal articles are table-knives and forks, pen and pocket-knives of every variety and description, scissors, razors, surgical, mathematical, and optical instruments, scythes, sickles, saws, with all sorts of carpenters' tools, and so forth. The most beautiful and highly finished articles of cutlery exhibited in the shops of the metropolis, though stamped with the vendor's name, are mostly made in Sheffield, and the cutlery of this town is deservedly held in the highest estimation in all parts of the world.

With the exception of plated saddlery ware, almost all the other descriptions of plated goods made at Sheffield are reckoned superior to those made at Birmingham or anywhere else. Some of the best plated articles have silver edges, and, when used with ordinary care, last for a very long time, and can with difficulty be distinguished from silver. An extensive manufacture of articles of German silver is carried on.

Mr. Jacob says that, in as far as he was able to ascertain by inquiries of platers, the owners of fitting-mills, and of the manufacturers of plated goods, he was disposed to estimate the silver used for plating in Birmingham and Sheffield, including with it that used at Walsall and other places, by saddlers' ironmongers, at about 750,000 oz. a year; and deducting from this 150,000 oz. used at Birmingham, and 100,000 oz. for that used at Walsall and other minor towns, there will remain 500,000 oz. for the consumption of Sheffield.

Sheffield produces few articles in copper and brass, and no toys, but, in lieu of these, she has some peculiar and important businesses. The conversion of iron into steel is carried on to a far greater extent here than in any other part of the empire, and most of the steel used at Birmingham and other places is prepared at Sheffield. The works of the Messrs. Sanderson, Jeasop and Sons, &c., for the converting and preparing of steel by tilting, rolling, &c. are the most extensive and celebrated in the world. The manufacture of springs for railway carriages has latterly become an important business.

The manufacture of files is one of the staple trades of

Sheffield. Files are used in immense quantities at home, and are largely exported. Any one who has ever seen the process of file-cutting would be likely to conclude that it was an operation which might be successfully performed by machinery, and a great variety of contrivances have been set on foot in that view. Hitherto, however, none of them has completely succeeded; so that the best files continue now, as heretofore, to be cut by the hand.

Few comparatively of the Sheffield manufacturers have large capitals, and the business is not so generally carried on in workshops and factories as at Birmingham. A person worth a few shillings may commence business on his own account as a cutler; and in this class, individuals are not unfrequently journeymen one year and masters another, and conversely.

In 1833 some of the staple trades carried on in the town and the individuals engaged in them were specified as follows:—Table-knives and forks, 2,000 hands; pen and pocket knives, 2,000; razors, 754; scissors, 800; files, 1,768; saws, 563; edge-tools, 708; stove-grates, fenders, &c., 1,530; white metal, 643; silver-plated goods, 500; making in all 12,430. (*Report on Manufactures*, &c. 1833, *Mém. of Evidence*, p. 176.) But the hands engaged in the conversion of iron into steel, and in several other important trades, are not included in this specification. Wages in Sheffield vary at present (1860) from about 12s. to 40s. a week. The labour in some departments is very severe, and in others great skill is required. Grinders, particularly those who do not use water in their operation, inhale the finer particles of stone and steel, and are usually short-lived. Many efforts have been made to obviate this, as well as to lessen the risk of accidents in the grinding mills; but the employment continues to be more than usually unhealthy and dangerous; and as much skill is required in grinding the finer descriptions of knives and razors, wages, being influenced by both circumstances, are generally high.

It was stated before the British Association that there are in Sheffield 56 workmen's clubs (most of which are unions), and their aggregate revenue may probably amount to 80,000l. a year, divisible among about 8,000 members. Many hands are employed in grinding spectacle glasses, most of which, indeed, come from Sheffield. The show-rooms and manufactories of the leading houses are freely opened to all respectable strangers, and afford abundant proofs of the ingenuity that has raised the town to its present importance. The workmen of Sheffield have been accused of a tendency to riot and

Sheffield is of great antiquity, and there can be but little doubt that close to or near it there was once a considerable Roman station. A town existed here under the Saxons; and in the reigns of the Plantagenets it was considered of sufficient importance to be defended by a strong castle. Mary Queen of Scots was confined for nearly 14 years in the Manor, a country seat near the town, belonging to the Earl of Shrewsbury, the owner, also, of the castle. The latter was seized in the civil wars by Sir John Gell, one of the parliamentary generals, and was demolished, by order of parliament, in 1646, there being now no remains except of the foundations. Its site, however, is still called Castle Hill. (*Hunter's History of Hallamshire; Statistical Account of the British Empire; Private Information.*)

SHEPTON-MALLETT, a market-town and par. of England, co. Somerset, hund. Whitstone, on a branch of the Brue, surrounded by several small hills, about 5 m. E.S.E. Wells. Area of par., 3,770 acres. Pop., in 1841, 5,265. The town, which comprises a number of narrow streets and lanes, has been much improved of late years, by the construction of a new bridge, and the opening of new roads, &c.; near its centre is a curious market-cross, erected in 1500. The church, in the early English style, is a spacious cruciform structure, with a tower and spire at the W. end. The living is a rectory, in the gift alternately of the crown and Mr. Wickham: its gross value is 820*l.* a year; but the curate's salary of 150*l.*, and other demands, reduce the nett income to 533*l.* (*Eccl. Rev. Rep.*) Here is the county bridewell, a large and conspicuous edifice; and here, also, petty sessions are held. There are places of worship for Baptists, Independents, Wesleyans, and R. Catholics; a convent of visitation nuns, the only one of that order in the kingdom; an almshouse founded in 1699; and a free school, established in 1813. The town had formerly a flourishing manufacture of woollen goods, but this branch of industry is now much fallen off. Markets, Tuesdays and Fridays; fairs, Easter Monday, June 18., and Aug. 8., for cattle and cheese.

SHERBORNE, or **SHERBOURN**, a market-town and par. of England, co. Dorset, hund. Sherborne; on the Ivel, which divides the town into two parts, Sherborne and Castleton, 16½ m. N. by W. Dorchester, and 110 m. W.S.W. London. Area of par., 4,900 acres. Pop., in 1841, 4,758. Sherborne is finely situated, partly on the acclivity of a hill, and partly in the fertile vale of Blackmore. It is compactly built; its principal streets, running E. and W., are crossed by smaller streets in a contrary direction. It was made a bishop's see in the 8th century, and continued such till 1075, when the see was removed to Salisbury, and Sherborne cathedral became an abbey church. Portions of the abbey, including the refectory, &c., still remain; but it was in great part destroyed by fire in the time of Henry VI. The church, however, chiefly rebuilt after that event, still exists, and is the modern par. church. It is a building of very different dates, but mostly in the perpendicular style; the S. porch is Norman. The groining is generally rich and good, and in the interior are several ancient monuments. (*Rickman's Gothic Architecture.*) The tower is upwards of 150 ft. in height; in it are 6 bells, the largest of which, weighing upwards of 3 tons, was presented by Cardinal Wolsey. The living is a vicarage in the gift of the crown, worth 260*l.* a year. Castleton (so called from the remains of an ancient castle, held by the royalists in the wars of Charles I.) is a separate living, a perpetual curacy, in the gift of Earl Digby, worth 81*l.* a year.

The Wesleyans, Independents, Friends, &c., have meeting-houses. The buildings of the free grammar-school, founded by Edward VI., adjoin the church, and are built round 3 courts, 2 of which are used as playgrounds. They comprise a good house for the master, formed of the ancient lady chapels, with upper and lower school-rooms, dining-hall, library, numerous dormitories, &c. This school should have, according to its charter, 20 governors, and has an annual income, from rents, &c., of near 900*l.* The headmaster has a salary of 125*l.* a year, with a house, and a fee of 1*l.* 1*s.* from each boy on entrance, and the like sum annually; the under-master has 100*l.* a year and a house: both masters must be university graduates, and members of the church of England, attendance on the service of which is compulsory on the pupils. Subordinate masters are also engaged; some for teaching writing and arithmetic, which are paid for separately. The course of instruction is principally modelled on the Eton system, though some deviations from it have latterly been introduced. In 1836, there were 43 boys on the foundation, and 86 private pupils of the masters. This school has 4 exhibitions at the universities of 60*l.* a year each, which may be granted for 4 years to pupils who have already been 4 years on the foundation; but these exhibitions have not always been filled up. Sherborne has an almshouse founded by Henry VI., which had, in 1836, 24 aged inmates, and an income of 666*l.* a year. There are numerous other charities, including Lord Digby's school

for girls, national and Lancastrian schools, &c.; and t. par. authorities have the privilege of keeping three boys at Christ's Hospital, London, on the produce of lands left for the purpose in 1670. (*Charity Commissioners' Thirtieth Report*, pp. 104—132.)

In the immediate neighbourhood is Sherborne Castle, the seat of Earl Digby, built by Sir W. Raleigh. The mansion is in the form of the letter H; the body, 4 stories in height, having hexangular towers at the 4 angles, which are united with as many wings. It has some antique tapestry, and fine paintings. The park comprises 340 acres, and some of the finest oaks in the co. A bridge of 3 arches over the Ivel leads to the house. Pope was a frequent visitor at Sherborne Castle; and on a monument in the church is inscribed his beautiful epitaph in memory of his young friends, the Hon. Robert Digby and his sister Mary.

Sherborne has some silk and woollen fabrics; but these, as well as other branches of industry formerly carried on in the town, have greatly decayed. It is within the jurisdiction of the county magistrates. Assizes were regularly held here till the reign of Edw. IV., but have since been only occasional. General quarter sessions are held here on the Tuesday after Easter. Though not a modern parl. bor., Sherborne sent mems. to the H. of C. in the reign of Edw. III. Market-days, Tuesday, Thursday, and Saturday; fairs, May 22., July 18. and 26. (usually), and Oct. 14., chiefly for cattle and pedlery.

SHETLAND ISLANDS. See **ORKNEY AND SHETLAND.**

SHIELDS (NORTH). See **TYNEMOUTH.**

SHIELDS (SOUTH), a parl. bor., market-town, sea-port, and township of England, co. Durham, E. div. of Chester ward, par. Jarrow, on the S. bank of the Tyne, near its mouth, and directly opposite North Shields, about 8 m. below Newcastle, and 16 m. N.N.E. Durham. Area of parl. bor., 1,760 acres. Pop., in 1841, 23,072. This, and its sister town on the opposite bank of the river, may be regarded, in some measure, as the out-ports of Newcastle, their pop. and importance having grown up with the increasing magnitude of the coal trade and commerce of the latter. Its lower part consists principally of a narrow, crooked, and inconvenient street, extending for nearly 2 m. along the river; but the streets in the upper part of the town are wider and better built, and lighted with gas. The principal edifices and institutions are the town-hall, also used as an exchange, a neat building in the centre of a spacious market-place; a theatre, a scientific and mechanics' institution, charity-school, dispensary, and the various places of worship. The church, dedicated to St. Hilda, is of considerable antiquity, but has been frequently repaired and modernised. The living is a curacy, in the gift of the dean and chapter of Durham, worth 330*l.* a year nett. There are chapels for various dissenting sects, to most of which are attached Sunday-schools, and various charities, and benevolent societies. In the town-hall petty sessions are held twice a month, besides courts leet and baron by the dean and chapter of Durham, as lords of the manor. Although the appearance of South Shields has little to recommend it, and its buildings are far from imposing, yet it is a place of much importance. The river Tyne is here about two-thirds the width of the Thames below London Bridge; and the vessels which belong to or rendezvous at N. and S. Shields are disposed in tiers on each side, as in the port of London. The town is rapidly increasing; a considerable quantity of ground is marked out for building in the E. and S. directions, and no doubt can be entertained that if land, upon a freehold tenure, could be procured, the rate of increase would be much more rapid, and the scale of buildings greater. The whole of the chapelry is the hand of the dean and chapter of Durham. South Shields had formerly many salt-pans, and an extensive manufacture of salt; but this has been abandoned, and ship-building is now the staple business of the town, and is very extensively carried on, 12 ships, of the burden of 2,698 tons, having been built in 1840. It has, also, very extensive glass-works, a pottery, a coal mine (which may be said to be in the town), and manufactories of soda, alum, &c. (*Boundary Report.*) Still, however, the main dependence of the town is on the coal trade of the river. Indeed, most of the large colliers belonging to Newcastle load at South Shields, the coal being brought down the river in lighters, or *keels*; and it is said that as many as 500 vessels are frequently seen lying together in the haven. There belonged to the port, on the 1st Jan. 1830, 417 vessels of the aggregate burden of 108,347 tons. The town communicates by the Brandling Junction Railway with the railway from Newcastle to Carlisle. The Reform Act conferred on South Shields the privilege of sending one mem. to the H. of C. The parl. bor. comprises the townships of South Shields and Westoe. Reg. electors, in 1849-50, 903.

Mr. Greathead, of this town, invented the life-boat, the first being built here by subscription in 1790. Markets

glass. The new church of St. Chad is a handsome modern structure, formed by the intersection of two circles, with a tower and portico attached; the smaller of the circles being occupied by a grand staircase, and the larger one, 100 ft. in diameter, being the body, chancel, &c. of the building. St. Mary's, a cross church, of Norman and early English architecture, has a spacious chancel and chantry chapels, and a fine tower surmounted by a spire, one of the loftiest in the kingdom. The abbey church, the W. portion of a Benedictine monastery, founded by Roger de Montgomery, first earl of Shrewsbury, in 1063, displays many curious features of Norman architecture, combined with the earlier pointed style: the great W. window of the tower is only equalled by that of York cathedral: the aisles contain several fine old monuments, and opposite the S. entrance is an elegant octagonal stone pulpit: the interior forms a beautiful oriel, the roof being vaulted on eight delicate ribs: it formerly stood in the refectory. St. Giles's is a small but handsome edifice, built in the early part of the 12th century. St. Alkmund's was rebuilt in 1795, in the modern Gothic style, with the exception of the tower and spire, 184 ft. in height, which are singularly elegant. St. Julian's is a plain oblong building of brick, rebuilt in 1749: the tower belonged to the old church. St. George's, St. Michael's, and Trinity churches, have been erected during the last 10 years. The first is of freestone, and cruciform, in the lancet, or early pointed style. The two latter are of brick, in the Doric style, affording ample accommodation in free-sittings. Some of the parishes extend into detached parts of the adjacent country, where there are four chapels of ease belonging to St. Mary's, and one to St. Chad's.

Besides the churches, there are places of worship for Roman Catholics, Wesleyan Methodists, Independents, Baptists, and Unitarians, with attached Sunday-schools; and a meeting-house for the Society of Friends. A large national school, founded in 1778, is attended by about 350 children of both sexes, and nearly an equal number of boys are instructed in a Lancastrian school. Allat's charity-school provides clothing, instruction, and an apprentice-fee, for 30 children of each sex. Bowdler's school, in the par. of St. Julian's, was established in 1794 for a similar purpose; and in the suburb of Frankwell, across the Welsh Bridge, is an hospital, founded in 1734, which, besides supporting 12 aged people of each sex, furnishes instruction to 25 boys and 25 girls of Frankwell. There are several almshouses belonging to different foundations, and attached to particular pars.

The most distinguished public charity of Shrewsbury, however, is the free grammar-school, founded and endowed by Edward VI., but greatly enlarged by Queen Elizabeth. This school, prior to the close of the last century, had, owing to certain defects in the original rules and ordinances, fallen to decay; but in 1798 an act was passed "for the better government and regulation of the free grammar-school of Edward VI.," by which the management of the school was vested in the bishop of Lichfield and Coventry and 13 trustees or governors, one of whom is the mayor for the time being. At the same time, the number of masters on the foundation was reduced from four to two, and their appointment was vested solely in St. John's College, Cambridge. The income arising from the endowment is about 2,600*l.* a year, besides which it confers several advantages on its *alumni* at both Universities, viz. four exhibitions of 70*l.*, and four of 15*l.* each, at St. John's, Cambridge; four of 60*l.* each at Christ Church, Oxford; one of 100*l.*, and three of 25*l.* each, either at Oxford or Cambridge; three contingent exhibitions; and six scholarships, with one bye-fellowship at Magdalen College, Cambridge. Prizes are annually awarded to merit; and to the best scholar proceeding to college is given the Sidney gold medal, having on its obverse the bust of Sir Philip Sidney, who, with his friend Fulke Grevill, afterwards Lord Brook, the poet, was educated in Shrewsbury School. During the present century the school has attained high celebrity, from the learning and talents of its master and (afterwards) visitor, Dr. Butler, late Bishop of Lichfield and Coventry. In consequence of the success of his pupils in competitions for prizes, exhibitions, and other honours, at the universities, the sons of the gentry have been sent here from all parts of the kingdom, and the establishment has, for many years past, comprised, independently of the free scholars (who must be sons of burgesses), many pupils paying handsome sums to the masters for board, lodging, and instruction: in fact, few public schools in England are superior to that of Shrewsbury. The school-house, erected in 1630, on the site of a more ancient wooden building, is a lofty structure of freestone, forming two sides of a court, the third side of which is formed by the library and chapel: a court is entered by a gateway, having columns on each side, with a Greek inscription over the arch. Two large houses belonging to the masters, contiguous to the schools, comprise every accommodation for boarders; and there are large play-grounds in front and at the back of the schools.

The town has 4 weekly newspapers; a literary and philosophical society; a mechanics' institute, and a public library with nearly 6,000 vols.; the assembly-rooms and theatre are well attended during winter; and races are annually held in the neighbourhood. On the S. side of the town is one of the most celebrated promenades in the kingdom, called the Quarry. It is formed in meadow ground gradually sloping to the river, along which extends a graceful avenue of lofty lime trees, 540 yards in length.

Shrewsbury was formerly of considerable importance as a mart for flannels from Welshpool, Newtown, &c.; but this branch of trade is nearly extinct. It has, however, a large factory for spinning flax, with some smaller factories, and a large iron foundry, the whole furnishing employment to several hundred persons. The prosperity of the town, however, does not depend solely on its trade, as it is a favourite place of resort for persons of small income, or who have retired from business. The Severn, which even here is celebrated for its salmon, is navigable as far as Shrewsbury by vessels of from 30 to 60 tons, and a canal to Wombbridge opens a communication with the coal districts of Staffordshire. (*Man. and Parl. Board. Rep.*) The banking establishments of Shrewsbury comprise various private banks and joint-stock banking companies, besides a savings' bank. The vicinity being a good barley country, the malting business is carried on to a considerable extent.

Shrewsbury, which has received many royal charters, especially from Richard I. and Charles I., is divided into 5 wards, and is governed by a mayor and 5 other aldermen, with 30 councillors. Corp. revenue, in 1847-8, 2,634*l.* Quarter and petty sessions for the bor. are held here under a recorder, and there is a county court, before which 1,134 plaints were entered in 1848. The Lent and summer assizes are held here, as well as the quarter-sessions for the co. Shrewsbury has sent 2 mems. to the H. of C. since the reign of Edward I., the right of election down to the Reform Act being in burgesses paying scot and lot, and not receiving alms or charity. The electoral limits were enlarged by the Boundary Act, so as to include 1 entire par., and parts of 2 others, with the whole bor. Reg. electors, in 1849-50, 1,412. Markets on Wednesday and Saturday: fairs on the second Tuesday and Wednesday in each month, for cattle, horses, cheese, and butter.

Shrewsbury is supposed to have been built after the Roman station *Uricontium* had been destroyed in the 5th century. William the Conqueror gave the town and surrounding country to Roger de Montgomery, one of his followers, who built here a strong baronial castle, the keep of which still remains, being converted into a modern dwelling-house. In 1103 the castle and property were forfeited to the crown. Shrewsbury, from its situation close to Wales, was the scene of many border frays between the Welsh and English; and, in 1277, Edward I. had his quarters here. On the 21st of July, 1403, a desperate battle was fought near the town, between the royal army, commanded by Henry IV., and that of the rebel Earl of Northumberland, under the command of the famous Lord Percy, surnamed Hotspur: the death of the latter, by an unknown hand, decided the victory in the king's favour: the loss on both sides was immense. During the wars of the Roses, Edw. IV., after the defeat and death of his father, Richard Duke of York, raised an army among the townspeople, with which he defeated the opposite faction at Mortimer's Cross. In the war between Charles I. and the parliament, the inhabs. warmly espoused the cause of the former; but in 1664 the town yielded to the parliamentary troops under Col. Mitton, and the fortifications were destroyed. Dr. Taylor, the learned editor of "Demosthenes," and the author of "Elements of the Civil Law," was the son of a barber of this town, where he first saw the light in 1703. It was, also, the birth-place of Dr. Burney, the author of the "General History of Music." The surrounding country is picturesque and highly cultivated, the plain extending every way for about 13 m., beyond which are lofty ranges of hills. About 22 m. from the town is Boscobel House, where the Penderell family concealed Charles II. after his defeat at the battle of Worcester. (For further particulars the reader is referred to *Owen & Blakeway's History of Shrewsbury*; *Pidgeon's Memorials of Shrewsbury*; *Corp. Reports*; and *Private Information*.)

SHROPSHIRE. See SALOP.

SHUMLA (the an. *Marcianopolis* ?), a city and strong military position of Turkey in Europe, being, in fact, one of the keys of Constantinople, on the N. declivity of the Balkhan (an. *Mons Hæmus*), on the great road from Constantinople to Rustchuk, 63 m. S.E. the latter; and 280 N.N.W. the former. Pop., according to Boué, 20,000. In a military point of view, Shumla is to be regarded as a vast entrenched camp. It occupies the declivity of a gorge in the mountains, which incloses it on three sides, like a horse-shoe; and on the fourth side, which descends into the plain, it is protected by a small hill, on which is a strong redoubt. The space occupied

by the town is about 8 m. in length, by 5 m. in breadth. In the last century it had pretty strong walls, but these have been all but destroyed, and it is now merely surrounded by a ditch. It is, however, defended by some batteries and by a garrison which has been greatly enlarged and strengthened since 1811. Its real defense consists, however, in the strength of its position, the plain to the N. of the town on which the attacking army must assemble is exceedingly unhealthy, and the surrounding mountains being steep, separated by deep rocky ravines, and covered with thick brushwood, which affords excellent cover for troops. Major Koppel and other military authorities, appear to think that, if well defended, it would be all but impregnable. The Russians attempted to take it twice in 1774, 1815 and, lately in 1859 but they failed on every occasion. Its principal defect is a military point of view is the great number of troops required for its effective defense, and the fact, as shown by the Russians in 1859 that it may be bypassed.

Alumina is transported by a rivulet, and is divided into the upper and lower towns. The former is principally inhabited by Turks. It has fine new barracks, numerous mosques, covered with tiles and copper, and which is unique in Turkey; a town clock with sixteen the hours, with a bell, &c. inhabited by a pasha, who had been in Russia. The lower town in which the Jews and Christians reside, is exclusively from, as it is said, the influence of the eastern Arabian, but more probably from the fact of all more shows how the rivulet which flows through the town. The union and texture of alumina are the best in Turkey and supply Constantinople with their wares. It has also some manufactures of silk and taffeta; and ready-made clothes are manufactured in large quantities for sale to the merchants of the capital. It is the residence of a pasha and a Greek archbishop. (See Kappeler's *Journal across the Balkans*, &c., 1. 331. &c.; *Atlas*, *Formes & Sources*, &c. 325. &c.)

WILKINSON, a city of Persia, prov. Khuzestan, on the Eastern coast Persian F., 185 m. S. W. by W. Isfahan, and 65 m. S. E. Shiraz, with which city it has disputed though, as generally supposed, unsuccessfully the distinction of representing the an. Susa. Lat. 30° 45' N., long. 48° 40' E. It was formerly the cap. of the prov., but having been depopulated by the plague in 1693, Dampier is not the cap. It may still however have 10,000 inhabitants (Anstruther). According to Col. Chesney's Memoir is about the size of Shiraz, and contains from 15,000 to 16,000 houses, all on the left bank of the Karoon. The town spreads E. from the river to a considerable farm, covering undulating ground, surrounded in its whole circuit by a wall of unburned bricks, and washed by an artificial canal on one side, and the Karoon on the opposite. The houses are principally of mud. The quartz, dike, &c. about the town are extensive, but ill

WOLF, E. 1970. *Journal of Fish Biology*, 2: 109-114.

Siam (called by the Siamese *Futhe or Pathu*), an extensive country of India beyond the Isthmus, comprising with its dependent states, most of the central and the parts of that peninsula extending between the 6th and 10th degs of lat and the 95th and 100th of E long., bordering N the Laos country, E the gulf of Siam, W the Siamese gulf, the British prov. of Tenasserim, and the Indian Ocean, and S the Gulf of Siam, which it divides on three sides. Its area has been very variously stated, but according to Crawford, it amounts to 190,000 sq. m. Its pop. has been estimated, though on very vague and unsatisfactory data, by Crawford, at 2,700,000, and by Hutton at 2,000,000 of whom, probably 1,000,000 are native Siamese, 500,000 Thais, 500,000 Malays, Peguans, &c. and 400,000 Chinese settlers, but other authorities estimate the population at from 2,000,000 to 3,000,000.

Physical Geography.—The western part of this kingdom consists of the fertile valley of the Be-ann, one of the principal rivers of B. B. Asia; and the great of Chiamou, on the E. side of the Gulf of Siam, is also very fruitful but, with these exceptions, most part of the country is as far at least as it is known, a bar-

* Major Anthony remarks that neither of them steps to the frontiers of thinking, the one, yes, of Freud, who, in any case, is to be sought for in the subject, the other, who is the "subject" of the U.S.A. of them and himself. (The first sentence is the only sentence in the book.)

regions, to mountainous and rugged. The mountain chains which traverse the Malay peninsula separating river-groups on the W. from the valley of the Than-bu-wang or Salween river, sometimes rise to the elevation of 5,000 feet, and a similar chain (the height of which, however, has not been ascertained), extends off on the E. from the Cambodian province of Rattanak. The only navigable rivers of any consequence are the Ma-nam, the Ma-hon or river of Cambodia, and the Than-bu-wang. The last two belong only partially to Siam, and are treated in Vol. I. of this work (p. 103, and 375). The Ma-nam or Ma-nam (mother of waters) runs on the territory through the heart of Siam, the principal sources of which are situated on its banks. According to native accounts, the Ma-nam has its origin in the table land of Yun-nan, whence it flows generally in a S. direction to the head of the Gulf of Siam entering the latter near lat. 12° and long. 101° E. after a course roughly estimated at 800 m. It is certainly far smaller here as far as Chien-wei or Hanoi and large towns extend to Yunnan, the old cap. of Siam. In its progress it creates several branches; and at Bangkok, about 14 m. direct from the sea, it divides into three separate channels. Only the most easterly of these, or Pak-nam river is suitable for large ships, the others being obstructed by shallows (bars) at daily tides, and even the Pak-nam branch has a bar 10 or 12 m. long, with but 14 fathoms water at low tide; so that, even when lightened, vessels entering or leaving the river are unfortunately apt grounded, though, the bottom being soft mud, they sustain no injury. (Mabrian. 8. 103). The Ma-nam, the numerous Ulu-martan and the other rivers of Siam annually overflow the country in July and the commencing months

The climate except in the north-west after the invasions, is usually salubrious though the summers and winters sometimes make great ravages. At Bangkok the mean temp. of the year is about 82° F., the heat is, however, not of an oppressive character and the annual range of the thermometer is stated to be only about 18 degs. What is called the cool season lasts from May to Feb.; March, April and May constitute the hot season; and the wet season continues during the rest of the year.

Mineral Products.—Iron is found in the mountain ridges on either side the valley of the Rio-negro; there are also mines of tin, copper, and lead; and the precious metals are produced in small quantities. But the mineral products of the country are too little known or estimated.

Stam is, perhaps, the cheapest country in the world for rice, which is constantly under 10 and often costs only 10 per cent. This is attributable principally to the fact, in this country, richness of the soil, and the fact of the being abundantly overwatered by the sea, as in the case of Stam. I therefore examined just a Stam to record it, *l'abondance de la rivière de riz, et d'eau et d'espérance* is *surabondance de plusieurs autres* (Le Lézard, *Paysage à Stam*, 184.) No doubt, however, the extraordinary cheapness of rice is in part, also, owing to the increase of the land tax, which, as mentioned by Mr. Lezard, is the rice land only about 100 per English acre, or from one sixth to one fourth part of the produce, instead of from one fourth to a half, or in French lands.

There, as in most Eastern countries, government is supposed to be the principal proprietor of the soil, but the tenants who pay the land tax run the whole chance of being ejected. It is said, however, that gardens, orchards, and houses, are viewed as the private property of the occupants. The Chinese are at once the principal cultivators and landers in every branch of industry.

Bamboo rice. Bam yields nearly all the most valuable products of the East, and under an intelligent government might furnish vast quantities for exportation. Sugar, pepper, tobacco, the plant Galls, are principal articles of culture, and the forests, which cover a large proportion of the surface, produce teak, sandal, ebony, rose, eagle, and a variety of other resins and perfumed woods, with aromatic gums, &c. The teak is sold by auction to be of the same quality as that of Birman; it is felled down 100 or from the interior to the capital and is there almost wholly employed in the construction of native junks, very little being exported. Iron, copper, tin, lead, and gold, are the principal mineral products; the gold is obtained by washing, the tin mostly from the tributary Malay territories. The wild animals are similar to those of Hindustan and the adjacent Uluu-Ongayee countries; the elephant is most abundant, and is extensively employed. A very rare, or white variety of the elephant, is sometimes found here, and is held in the highest estimation. Indeed, one of the titles of the Siamese monarch is, "lord of white elephants," several of which are maintained as state appendages at the royal court. "He who discovers one of these animals, is regarded as the most fortunate of mortals." The event is of that importance that it may be said to constitute an era in the annals of the nation. The fortunate discoverer is rewarded with a crown.

scribed by the earliest European travellers; and are of a more servile description than those, perhaps, of any other court in the East. The king, one of whose titles is "the God Boodh," is supposed by his subjects to be a deity, and is revered as such; an immeasurable distance being supposed to exist between him and the highest of the nobility. "The people," says Mr. Finlayson, "are governed by opinion, absurd and unjust, not by reason, by sense, or by kindness. The most degrading and brutal tyranny is mistaken for well-meaning patriarchal kindness; and the oppression of the multitude, and the grinding of the many, is regarded as the will of the Deity. No man either wishes for, or aspires to, freedom of thought or action; and tyranny has cast its roots so deep, that change would seem hopeless." (*Finlayson*, 158.) Next to the sovereign, the nobility absorb most of the legislative and executive power; there being, except in some cases of appeal, no establishments exclusively for judicial purposes. The Siamese have, indeed, written laws; but it frequently happens that the king, on his accession, publishes a new edition, with his own interpolations, though neither the original code nor the changes introduced appear to be much regarded by the administrators of the laws. The same chiefs who are charged with the military, civil, and revenue administration, are the only judges and magistrates. According to the laws of inheritance, a man must leave his property to his family in preference to strangers; but no claim of primogeniture is recognised, the children usually sharing equally. The nature of the marriage contract is much the same as in other eastern countries, polygamy being permitted, and divorces obtained without difficulty. A breach of the marriage vow is not visited with so severe a penalty as in Anam, but is usually expiable by a pecuniary fine. The penal code of Siam bears a strong analogy to that of China, especially in the liberal and indiscriminate use of the bamboo for the punishment of all minor offences. For crimes of magnitude, the punishments, as in Birman, are of the most savage description; torture may also be applied to extort evidence. They have, also, the same sort of ordeals for determining the guilt or innocence of accused parties that were common in Europe during the middle ages. And La Loubère and Crawford mention that, in the event of goods being stolen, should suspicion fall on different parties, it is customary to administer emetics to them all; in which case, the person with the weakest stomach, or who vomits first, is held to be the culprit! (*La Loubère*, i. 334.; *Crawford*, &c., *passim*.)

Armed Force.—Every male inhabitant, from the age of 21 upwards, is obliged to serve the state for four months a year. The following individuals are, however, excepted: members of the priesthood, the Chinese settlers, who pay a commutation tax, slaves, public functionaries, the fathers of three sons liable to service, and those who purchase exemption by a fine of from six to eight ticals a month, or by furnishing a slave or some other person not subject to the conscription, as a substitute. There is no standing army. The king has for a good many years made large annual purchases of muskets; and Mr. Malcolm estimates that he now possesses upwards of 80,000 stand of arms, besides a considerable stock of cannon. The principal force of the Siamese consists in their elephants; but when contrasted with Europeans, their army may be said to be contemptible. At Bangkok, there is a numerous navy of war-junks, galleys, &c., built on the Chinese model, and mounting heavy guns, manned by Chinese and other foreigners.

The **Public Revenue** is estimated by Crawford at about 3,145,000*l.* sterling a year; of which sum, the poll-tax and fines for non-service in the army may, perhaps, produce 2,500,000*l.*; the land-tax, 287,000*l.*; tax on fruit trees, &c., 65,000*l.*; on pepper, 50,000*l.*; on spirits and gambling, about 57,000*l.* each; the customs, 33,000*l.*, &c. But exclusive of the taxes paid in money or produce, the people are subjected to *corvées*, and other oppressive burdens. The collectors receive no salary, being remunerated by a tithe of the revenue realised; an arrangement which generates a variety of abuses. The receipts and expenditure are said nearly to balance each other; and there is seldom any large sum in the public treasury.

Religion.—The worship of Boodh is nearly universal in the countries lying E. of Hindostan; but the Buddhism of S. is very different from that of N. Asia.* Gaudama is worshipped in Siam under the name of Somona Codom. Every male Siamese must enter the priesthood once in his life, though he may quit it again at pleasure. The *talapoins*, or priests, live together in monasteries, sometimes containing several hundred individuals, endowed by the government or by wealthy persons. The Papal church has maintained missions in Siam for nearly 200 years; but, according to Malcolm, there are only about 2,200 R. Catholics in the country, including 800 Anamese, and several descendants of Portuguese. Neither do the American Baptist and other mis-

* An able sketch of Buddhism may be found in *Crawford's Embassy, &c. to Siam*, ii. ch. 2.; and there is a comprehensive account of its principal tenets, by a Buddhist priest, in the *Ceylon Almanac* for 1845.

sions appear to have made many proselytes. (*Malcolm's S. E. Asia*, ii. 155—164.)

Manners, Language, &c.—In the articles ANAM and BIRMAN in this Dict., various details have been given respecting the manners and customs of Ultra-Gangetic nations, most of which apply to the inhab. of Siam; though the latter are decidedly lower in civilisation than either the Anamese or Birmans. They are less gross, however, in their eating than the former; and women are not so much degraded among them as among the latter. They are also more generally acquainted with reading and writing than the Birmese. Both sexes dress nearly alike, and wear fewer clothes than almost any other semi-civilised people of the East; a cotton garment reaching downwards from the loins, with sometimes a scarf across the upper part of the body, usually completes the Siamese costume. Jewellery and trinkets are little used, but the teeth are always stained black. They are nearly as much addicted to gambling and cock-fighting as their Malay neighbours; they are also very fond of theatrical entertainments and music, in which last they display considerable skill. Their language is radically monosyllabic, and cognate with those of the Laos Shans and Anamese; but many words have been introduced into it from the Cambodian, a polysyllabic language, and the *Pali* or sacred tongue; which last the common dialect imitates in the form of its written characters.

As in other Asiatic countries, slavery is common, and some chiefs have hundreds or even thousands of slaves. Some of the conquered districts have been almost depopulated, to bring their inhab. to Siam; and at all times an active slave-trade is carried on along the Birman frontier. Persons are sold into slavery for debt; and men may sell their wives and children at pleasure. A common custom is for the master not to support his slave, but to allow the latter to work for himself for 2 or 3 months, to supply necessaries for the rest of the year. Children inherit their parents' bondage.

History.—The Siamese are said to possess records which go back for 1,000 years; but little in their accounts possesses any interest till 1511, when the first intercourse of Europeans with Siam took place. The Portuguese and Dutch had traded with the Siamese for the best part of a century, when the first British ship went up the Me-nam in 1612. In 1683, Constantine Phaulcon, a Cephalonian Greek, had found means to get himself raised to the dignity of foreign minister of Siam, and soon afterwards opened a communication with France. Louis XIV. sent an envoy (the celebrated M. de la Loubère, to whom we are indebted for an excellent description of the country) to Siam in 1685. The French were, however, expelled the country in 1690; since which time numerous wars, either aggressive or defensive, with the surrounding states, have been the most conspicuous events of Siamese history. (*La Loubère, Voyage de Siam*, 2 tomes, Paris, 1691; *Crawford's Embassy to Siam and Cochinchina*, one of the best modern works on the Ultra-Gangetic nations; *Malcolm's S. E. Asia*, ii. 120—164.; *Finlayson's Miss. to Siam, &c.*; *Chin. Rep.*, &c.)

SIBERIA, a vast territory of N. Asia, belonging to Russia, which *see*; and *see*, also, the article ASIA, i. 167.

SIBKIM, or **SIKKIM**, a state of N. Hindostan, tributary to the British, between the 26th and 28th degs. N. lat., and about the 88th E. long., having N. Thibet, E. Bootan, W. Nepaul, and S. the Bengal territory. Area, about 4,400 sq. m. Pop. estimated at about 166,000. From its situation on the S. slope of the Himalaya, its geography, products, &c., are nearly similar to those of Bootan and Nepaul, to which articles we beg to refer for its general description. It was placed under British protection in 1816. (*Hamilton's E. I. Gaz.*, &c.)

SICILY (an. *Sicilia*), the largest, finest, most important, most fruitful, and most celebrated island of the Mediterranean, constituting that portion of the kingdom of Naples entitled the *Domini al di la di Faro*, lies between lat. 36° 38', and 38° 18' N., and long. 12° 20', and 15° 40' E. It is separated from the S. extremity of Italy by the narrow Strait of Messina, only two miles across, and from Cape Bon in Africa by a channel 85 m. in width. It is of a triangular shape, and was hence, in antiquity, sometimes called *Triquetra*, but more commonly *Trinacria*, from its terminating in the three promontories of Boeo (an. *Lilybæum*), Passaro (an. *Pachynum*), and Faro (an. *Pelorum*). It seems to have derived its usual name of *Sicilia* from the Sicani or Siculi, its earliest inhab. Length, E. and W., about 215 m.; greatest breadth 150 m. Area, pop., subdivisions, &c., as follow:—

Intendancies (Valli).	Area in sq. m.	Pop. in 1845.	Pop. to sq. m.
Palermo - -	1,727	465,169	269.5
Messina - -	1,475	349,183	247.1
Catania - -	1,785	382,528	214.0
Noto - -	1,580	250,862	159.0
Caltanissetta -	1,592	176,295	115.7
Girgenti - -	1,621	235,764	144.2
Trapani - -	1,047	182,809	174.6
Totals - -	10,508	2,040,610	191.2

The Neptunian or Madonian chain of mountains, stretches from the Straits of Messina, at the N.E. extremity of the island, along its N. coast to Cape Boeo at its W. extremity. Some of its summits are of considerable altitude. It gives off several spurs to the S., which, with their ramifications, cover a considerable portion of the surface. But, exclusive of these, there are some mountains which are quite detached from and unconnected with any system. The principal of these is Etna, the most celebrated of European mountains, near the E. coast of the island, and by far the loftiest in Sicily, being not less than 10,872 ft. above the sea. (See ETNA.) There are some extensive plains: the principal is that of Catania, at the foot of Etna; the next in point of size being those of Milazzo, Terra Nova, Syracuse, and that extending along the S.W. shore for about 100 m. E. of Trapani. The rivers, though generally insignificant in point of size, are mostly celebrated in classic history or poetry. The principal is the Salso (an. *Himera*), which, as well as the Platani, Belici, &c., discharges itself on the S.W. coast. The Giaretta (an. *Simetis*) waters the plain of Catania. A great number of small brooks and torrents disembogue on the N. coast; but none of the rivers is navigable, or otherwise available for the purposes of trade. The only lake worth notice is that of Biveri, or Lentini, in the plain of Catania.

Except in some low and marshy tracts, the air of Sicily is generally salubrious, and the climate, though rather hot, is, for the most part, delightful. Cold weather is sometimes experienced, but the severity of the winter is never such as to affect the verdure of the country. Ice and snow are never seen except on Etna, and the highest summits of the Madonian chain; but the summer heats, especially during the prevalence of the scirocco, or S.E. wind, are often very oppressive. The range of the thermometer throughout the year at the level of the sea is from about 36° to 110° Fah.; its mean height being estimated by Smyth at 62·5°, and that of the barometer at 29·80. "Whilst the sun is in the northern signs, the sky, although it seldom assumes the deep blue tint of the tropics, is, nevertheless, beautifully clear and serene; but after the autumnal equinox the winds become boisterous, and the atmosphere heavy and dense; the dews and fogs increase, particularly on the coasts, and the rain falls in frequent and heavy showers." (Smyth, p. 4.) Sicily has, on various occasions, been subject to destructive earthquakes, which usually take place towards the end of winter.

The primary rocks in the mountains are principally granite, quartz, and mica. These are overlaid in many parts by limestone rocks, and most of the lower hill ranges are calcareous, abounding with metallic ores. The soil, though very various, is almost every where endowed with the greatest fertility, and has been famous alike in ancient and modern times for its extraordinary productiveness. Sicily was, in fact, the principal granary (*horreum*) of Rome. It is said by Livy to have been *Populoque Romanæ, pace ac bello, fidissimum annonæ subsidium*. (Lib. xxvii. cap. 5.) And the third oration of Cicero against Verres, or that entitled *De Frumento*, affords in every part the most conclusive proofs of the fertility of this fine island, and of the great importance of the supplies of corn which it furnished to Rome. In some of the valleys the soil consists of a rich loam, from 20 to 30 feet in depth! The decomposed volcanic products scattered over the surface of large portions of the country are also extremely fruitful, being suitable alike for the production of corn, wine and oil. Even at present, despite the wretched system of agriculture, Smyth says that the usual produce is from 10 to 16 times, and in favourable seasons, and on the best lands, 28 times the seed! Immense beds of sulphur are found in the central and S. parts of the island.

The vegetable products of Sicily embrace numerous tropical as well as European plants. The surface has been divided, according to its elevation, into the following five regions, each distinguished by its vegetation.

Regions.	Height.		Products.
	Pl.	Pl.	
1. Sub-tropical	—	to 600	Papyrus, sugar-cane, date and dwarf palm, olives, agrum, &c. Similar to those of Apennines, at same elevation. (Mountains not so thickly wooded as in Italy.) Maize, wheat, &c., to 4,000 ft. Birch, juniper, &c. (See ETNA.)
2. Evergreen	600	— 2,000	
3. Oak and chestnut	2,000	— 4,000	
4. Beech wood	4,000	— 6,000	
5. Upper reg.	6,000	& above	

Sicily was believed, in antiquity, to have been the native country of corn. (*Diod. Siculus*, lib. v.) Homer says of its early inhabitants:—

"Untaught to plant, to turn the glebe, and sow,
They all their products to free nature owe.
The soil untill'd a ready harvest yields,
With wheat and barley wave the golden fields;
Spontaneous wines from weighty clusters pour,
And Jove descends in each prolific shower."
Pope's Odyssey, lib. xi. lla. 171.

Agriculture, also, is said to have originated in the island under the auspices of Ceres. But (*quantum mutatus!*) there are now few, if any, countries in Europe in which that art is in so degraded a state. There seems every reason to think, from the number and magnitude of its cities, and other circumstances, that its population in antiquity must have been much larger than in modern times. Indeed, the fair presumption seems to be that it must then have amounted to at least from 3½ to 4 millions. And yet, notwithstanding this greater density of pop., it was, as already seen, able to export vast quantities of corn to Italy. It does not, however, appear very difficult to account for this melancholy change. After the overthrow of the Roman power, Sicily was occupied successively by the Greeks, Saracens, Normans, and French, till at length it became a dependency first of the crown of Spain, and more recently of that of Naples. It is to this dependence, and to the introduction of the feudal system by the Normans, that its backward state is principally to be ascribed. The multiplied abuses which grew up in Spain under the reign of Ferdinand and his successors of the Austrian line, flourished with equal luxuriance in Sicily, and have proved no less destructive of the industry and civilisation of its inhabs. than of those of Spain. The Neapolitan regime has been equally pernicious; and misgovernment, the abuses of the feudal system, insecurity, and unequal and arbitrary taxes, have here, as every where else, paralyzed industry and impoverished the people.

But the grand curse of Sicilian, as of Sardinian industry, will probably be found in the oppressive restrictions that have been laid on the exportation of corn. Down to a late period no corn could be exported without leave being obtained from the *Real Patrimonio*, a body that pretended to take an account of the crops, and which determined whether there were to be any exportation; and in the event of its being allowed, it issued, or rather sold, licences to a few favoured individuals, authorising them to export certain specified quantities! Even had Sicily been ten times more productive than she really is, it is quite impossible that agriculture could have flourished under such discouragements. Luckily, however, these oppressive restraints have recently been abolished, and there are no longer any obstacles to the free exportation of corn. Oppressive taxes, the want of leases of a reasonable length, and of practicable roads, are at present, perhaps, the greatest obstacles to agriculture.

The property of the island was valued in 1811, when the English garrison and fleet occasioned a great demand, and high prices for produce of all kinds, and this valuation has been continued to this day, as the basis on which the land and house tax (*fondaria*) is levied. A rate of 7½ per cent. on this valuation was first charged, which was subsequently raised to 12½ per cent., at which it is now fixed. Owing, however, as is stated, to the fall in the price of agricultural produce since 1811, this tax is alleged by Mr. Macgregor to be more than equivalent to a duty of 25 per cent. on the produce of the soil taken at its present (1840) value, and to be a very great obstacle to improvement. We believe, however, that its influence in this respect, though considerable, has been much overrated; and that the backward state of Sicily is principally owing to other and different causes.

Though there be in Sicily a very considerable number of small proprietors, by far the greater part of the land belongs to the crown, the church, and the nobility, some of whom have very extensive and valuable estates. Down to a recent period these were held under a system of strict entail, and their occupiers, as well as those on the estates of the crown and church, usually held under triennial leases, and were in a state of feudal bondage, and subject to numerous exactions on the part of their lords. Under such circumstances, even though there had been neither restrictions on exportation nor a land-tax, the depressed condition of the peasantry, and the low state of agriculture, need not be wondered at.

But we are glad to have to state that the dawn of a better day seems to have arisen, and that several important changes have lately been introduced. We have already noticed the removal of the restrictions on exportation; and in 1812 and 1838 laws were passed for the abolition of the feudal system, and the complete emancipation of the peasantry. And, notwithstanding the poverty and ignorance of the latter will hinder them from immediately profiting, to the extent that might be anticipated, from the passing of this law, it cannot fail, in the end, to be productive of the best effects. It was also enacted in 1819, that in future, on the death of any individual possessed of an estate in land, and having more than one son, the half only of the

estate shall descend to the eldest son, and that the other half shall be divided in equal shares among the other children. This law which appears to have been framed on the model of that which regulates the succession to property in France, will probably have nearly similar effects. In both countries the chance of entails might have been obtained without running into the opposite extreme, and establishing a system that can hardly fail, in the end, to occasion the too great division of landed property.

The arable lands in Sicily have been roughly estimated to comprise about 2,700,000 acres, vineyards, 115,000 do.; vegetable and fruit gardens, 250,000 do.; woods and olive plantations, 115,000 do.; the remainder of the surface being mostly waste. Ploughs and most other agricultural implements appear to have undergone no improvement for centuries, and "a bunch of branches, drawn by an ox, supplies the place of a harrow" (Barth). The magnificent crops which are occasionally met with are wholly attributable to the extraordinary fertility of the soil, and not to the labour or skill of the cultivators. In fact, such is the conservatism of the husbandmen, or such the difficulties resulting from the apportionment under which they have laboured, that, according to Mr. Macgregor, nearly a third part of the pop. have to depend for support on the fruits of the earth (Indian fig. or figuina), found in the greatest profusion in most parts of the country (Report 46).

We suspect, however, that there is a great deal of exaggeration in this statement; and, at all events, it is still clearly certain that independently of the changes already alluded to, there has of late years been a decided increase of the means of subsistence. The growth of pop., which increased from 1,200,000 in 1790 to 1,400,000 in 1801, being an augmentation of 166,666 is an evidence of this, and has, no doubt, been at once a cause and a consequence of the improvements which, though slowly and almost imperceptibly have begun to make their way in the island. At present (1845) the pop. is probably not under 2,100,000.

Cultures of wheat and barley, hemp, flax, and cotton are raised with but little labour. The culture of the last is said to be extending of late years, especially in the neighbourhood of Messina. It is mostly short-stemmed, and but little is exported, and that only to Naples and Trieste. It is probable, however, that by attention to its culture, and the introduction of improved varieties, its quality might be improved, and it might become an article of some importance. The sugar cane was formerly a staple product of the S. shore of Sicily. But, owing to the introduction of cheaper sugar from the W. Indies and Brazil, the culture of the cane is now restricted to some small plantations near Aversa, and will probably at no distant period, be wholly abandoned.

The district round Marsala is the principal seat of the wine culture; and, thanks to the exertions of some English capitalists established in that city, the production of wine is becoming an important branch of industry and it forms a principal article of export. (See Marsala.) Vineyards generally treated as in France, being cut low and not hedged along other trees, as in Italy. But, except in the English establishments, little

attention, which have been introduced during the present century, are becoming a principal article in the diet of the peasantry. The Sicilian vineyard, who are very tardily adopted, receive, according to M. Stoddard, from 5 to 6 carboys or from 12 to 15 at a day. Besides potatoes, their food consists chiefly of mutton, pork, and cheese, salt fish, cheese from sheep's milk, oil, and beans, which last are a staple in the diet of both men and cattle. The peasantry sometimes eat salted pork, but rarely any other kind of flesh. (Stoddard, *Guide, Sicily*, p. 60, passage.)

The want of improved means of transportation is one of the greatest drawbacks on agriculture, except in the vicinity of Palermo and other great towns, they are all but inaccessible, and the only mode of travelling is by means of the *mulino*, a kind of 8y without wheels, holding two persons, and carried like a sedan chair by two coolies, one before and the other behind. Happily, however, government appears to have at length become alive to the evils arising from the want of roads, and 14 per cent. of the land tax is heretofore to be applied to their construction, and permission has also been given to raise a loan of 1,000,000 dollars, at 24 per cent., for the same purpose. (Revenue & Exp. 5.)

Formerly there were only certain parts from which corn could be exported, a limitation which gave rise to the establishment of three sorts of public magazines, or *coroneri*, where the corn may be deposited till an opportunity occurs of shipping it off. Provided it be of good quality and be brought in immediately after harvest or at latest, in August, it is purchased from the owners, what it gains in bulk after that period (about 5 per cent.), being sufficient to defray all expenses. The receipt of the coroner or keeper of the magazine, is negotiable like a bill of exchange, and is the object of speculative purchases on the exchange at Palermo, Messina, &c. according to the expected rise or fall in the price of corn. The depositor of a quantity with it in such portions as he pleases, the whole being faithfully accounted for. The public magazines, in some parts of the island, are either conversions into enormous rocka, or holes in the ground shaped like a bottle, walled up, and made water-proof, containing each about 500 cartons of corn, or about 1,000 English bushels. The neck of the bottle is hermetically closed with a stone lashed with gypsum. Corn may be thus preserved for an indefinite length of time, at least it has been found in perfectly good order after the lapse of a century. (Stoddard, p. 60; *Journal* &c. 116.)

The rearing of live stock occupies even less attention than things. In general the horses, drays, and mules of Sicily are small and ill made, the oxen of Messina and the flocks of the Pantheon being exceptions. The Fucine, or reddish-brown, and long horned breed of cattle, are large, strong, and well formed, and there is a good breed of goats. But the sheep, comprising a few *Morina* flocks, are very inferior and their wool is used only in the coarse manufactures of the country. Hops are of the worst possible breed. Forests, owing to waste and mismanagement, have almost disappeared, except on the flanks of Etna and on some of the M. mountains. Bees for wine making, and ship timber, are mostly imported from other countries, and even fire-wood is scarce.

The fisheries are chiefly conducted by corporations of fishermen, or *marinai*. That of Palermo employs during the season, from 500 to 1,000 boats, and 2,500 fishermen; and the produce is valued at from 25,000 to 30,000 a year. The fishermen of Palermo belong to 2 corporations, each of which has a physician, surgeon, chaplain, and other officers, who are paid from a fund raised by a subscription from each member, of about 2 per cent. on his share of the produce. This fund is also applied to the relief of members and other general purposes. Tuna, the fish principally caught on the Sicilian coasts, are taken as in other parts of the Kingdom of Naples (which see). This valuable fish, which was in great request in antiquity, as well as in modern times, is of large dimensions, being generally from 6 to 8 ft. in length, with a nearly equal girth. Its flesh is highly nutritious. The choice of tunny comes the Mediterranean early in the year. The *marinai*, or fishing establishments, on the Sicilian coasts, are more extensive and valuable than those in any other part of the Mediterranean. The boats belonging to the one in the Bay of Palermo are so very strong as to be able to arrest the progress of a ship when under sail. The fishery of the sword-fish is confined chiefly to the Straits of Messina, and the anchovy and pilchard fisheries to Sicily. Lard is some trade in *carapace*, made of the roe of the mullet. The coral fishery, near Bonn, in Africa, is principally frequented by fishermen from Tripoli, at which city the coral is polished and brought for exportation to Catania, Naples, Leghorn &c.

The minerals of Sicily are important and valuable. Sulphur ranks first; it is found in great quantities imbedded in the rock, or in gypsum and limestone, over

and being monopolized by the government in Sicily, as in Naples, it might be a profitable article of trade if there were any public enterprise. Iquorite is found growing wild in several parts of the island, and considerable quantities of it are exported. The culture of chamber is more attended to, and it forms a principal article of export.

We come then, to 7,891. (*Giornale di Sicilia, Palermo*, 1888, No. 1. 111.) Education is almost wholly in the hands of the clergy, but it is better conducted than in the rest of the Neapolitan dom., and if the quality of the instruction were at all commensurate with the number of schools, the people of Sicily would, in this respect, be fully on a level with most other countries. Palermo and Catania have flourishing universities, both of which have had many distinguished individuals among their professors: there are colleges and academies in 91 towns, and primary and secondary schools in each commune. In these popular schools, besides reading, writing, and arithmetic, the pupils are taught linear drawing and the geography of Sicily. In the prov. of Catania the method of mutual instruction has been adopted. There are several Jesuits' schools, 3 episcopal academies for destitute students, and boarding-schools for the nobility, &c., at Palermo. Females are usually educated in convents till they be 18 or 20 years of age. Some scientific journals are published, especially at Catania, a city distinguished for the superior education and morals of its inhabitants. But it would be nugatory to expect that there can be any thing like an efficient system of superior education, or any literature or philosophy deserving the name, in a country where the press is subject to the most severe censorship; and where all foreign works that might tend to expand the minds of the people, and to make them acquainted with their rights and duties, and with the elements of national prosperity, are so rigorously excluded as if they were fraught with pestilence. Sicily has numerous hospitals and other public institutions, but they are said to be generally ill-conducted. In most large towns there is a *municipio*, or government pawn-bank.

Besides the *fondiarie*, or land-tax of 12½ per cent., the public revenue is derived principally from a tax of 13 taris and 15 grains per salma on the grinding of corn, a duty of 4 gr. per rotolo on the meat consumed in the provincial capitals, with customs duties, and duties on shipping, stamp and registration duties, tobacco duty, the lottery, the post-office, and a duty on the salaries of all persons in official situations. The whole may amount to about 1,800,000 *ducats*, that is, to about 960,000*l.* a year gross revenue. We subjoin a copy of that part of the Budget for Sicily for 1888, which gives a view of the revenue of the island, and of the sources whence it is derived. [See top of next column.]

Each intendency is under the control of an intendant or prefect, with a council and secretary, and each district under a sub-intendant, council, and secretary. The head board of police for the island, which sat at Palermo, has been dissolved, and the intendants and subintendants now communicate directly with the ministry. Each community is under a syndic elected by the inhabitants from among their number. In each commune and every quarter of the principal cities, there is a *consigliere* nominated by the king on the recommendation of the *inhabe.*, who gives summary decisions in disputed matters not exceeding the value of 5 *ducats*; a judge for each *sindacato* resides in every principal town, and each intendency has a civil tribunal with a president, 3 judges, an attorney-general, and a chancellor, and a superior criminal tribunal. The superior courts in the intendancy of Palermo, Catania, and Messina are at once civil and criminal tribunals, and have 6 judges each. That at Palermo has the supreme jurisdiction throughout the island. There are, in fact, no fewer than 360 judges among a pop. of 3 millions! The 180 judges of *circondario* receive from 30*l.* to 84*l.* each, the civil judges about 180*l.*, criminal do. from 310 to 380*l.*, and the judges of the supreme court from about 400*l.* to 800*l.* a year; but this excessive multiplication of courts and judges is a nuisance rather than any thing else. With few exceptions, too, the judges and other legal functionaries are said to be notoriously corrupt. But the principal obstacle in the way of the proper administration of justice consists in the obscurity and contradiction of the laws. This affords great facilities for, and temptations to litigation, and the country is, in consequence, overrun with swarms of low, pettifogging attorneys. There can, indeed, be no doubt that one of the greatest improvements of which the island is susceptible would be the simplification of the law, and the dismissal of more than half the present judges, giving their salaries to those that were still retained. "The prisons," says Mr Macgregor, "especially those for political offenders, seem to claim a large share of the attention of government; not, however, for the comfort of the prisoners, but for their security. The state and criminal prison, on the island of Marittimo, contains, perhaps, the most horrid and strongest dungeons in the world. The prisoners are lowered down several hundred feet from the rocky height above, and are seldom, if ever, heard of afterwards." (*Report*, p. 48.)

Inhabitants.—The Sicilians are of middle stature, well-made, with dark eyes, and coarse black hair; their features are better than their complexions; and they at-

tain maturity and begin to decline earlier than the *inhabe.* of more northern regions. They are cheerful, inquisitive, and facetious, with a redundancy of unmeaning compliments, showing they are not so deficient in natural talents, as in their due cultivation. Their delivery is vehement, rapid, full of action, and their gesticulation violent; the latter is so significant as almost to possess the powers of speech; and animates them with a peculiar vivacity, bordering, however, rather on conceit than wit, on farce than humour. The upper classes are incurably indolent, and fond to excess of titles, and such like marks of distinction. Here, in fact, every house is a palace, every handicraft a profession, every respectable person at least an excellency, and every errand-boy is charged with an embassy! This love of ostentation is so inveterate, that the poorer nobility and gentry are pecuniarily to an extreme in their domestic arrangements, and almost starve themselves to be able to appear abroad in the evening with a mean and poverty-stricken equipage. Notwithstanding the energies of the peasantry be impaired by the mildness of the climate, and the multiplied oppressions of which they are the victims, they may be said, as compared with the upper classes, to be industrious. They are also sober, but passionate, ignorant, credulous, and superstitious. They are, however, bigots, rather than fanatics; and are civil and kind to

such heretical strangers as may be thrown in their way. There is a great want of keeping, and of comfort, even in the best houses; and in them, and, indeed, everywhere, there is a disgusting want of cleanliness. (*Smyth*, pp. 26—66.; *Stolberg*, iv. 359. &c.)

Sicily early became the seat of many flourishing Greek colonies, of which Syracuse and Agrigentum were the most celebrated. At a subsequent period it was the scene of an obstinate and lengthened contest between the Carthaginians and Romans, and became the first and most valuable acquisition made by the latter beyond the limits of Italy. After the fall of the Western Empire, it was successively held by the Vandals, the Goths, and the Greek emperors, till 827, when it was overrun by the Saracens. In 1072 it was taken by the Normans, who, as already seen, established the feudal system, and kept possession of the island till the establishment of the Swabian dynasty, in 1194. In 1266 Charles of Anjou became master of Sicily; but the massacre planned by John of Procida, known by the name of the "Sicilian Vespers," 29th March, 1282, put an end to the sway of the Angevines. It soon after became a dependency of Spain, and was governed by Spanish viceroys till 1706, when a popular revolution annexed it to Austria. By the peace of Utrecht, in 1711, it was ceded to Victor Amadeus of Savoy, who, in 1720, was compelled by the emperor Charles VI. to exchange it for Sardinia. In 1734 the Austrians were driven out by the Spaniards, and the infant Don Carlos was then crowned king of the Two Sicilies. While the continental dom. of Naples were held by Napoleon, Palermo was the residence of the court, the island being defended by an English fleet and garrison. An insurrection that broke out in 1821 was speedily suppressed by the Austrians.

Still, however, there was a great deal of dissatisfaction in the island, and a strong desire for a more liberal system of government. And the party favourable to the independence of Sicily, taking advantage of the excitement occasioned by the French revolution of February, 1848, summoned a parliament, which, by a resolution agreed to on the 13th April, 1848, formally deposed the House of Bourbon from the throne; declaring at the same time that Sicily would form herself into a constitutional monarchy under a sovereign of her own choice. And conformably to this declaration, the throne was subsequently offered to the duke of Genoa, second son of the King of Sardinia. But the Sicilians lacked the courage and ability to defend the new order of things. A Neapolitan army having landed in the island, reduced Messina; and after some delay occasioned by the interference of the admirals of the English and French fleets then in the bay of Naples, who appeared at first to be disposed to support the cause of the insurgents, the latter were defeated at all points, and the former system of government re-established.

SIDMOUTH, a sea-port, market-town, and par. of England, co. Devon, hund. E. Budleigh, on the Sid, at its mouth in the English Channel, 13½ m. E.S.E. Exeter. Area of par., 1,970 acres. Pop., in 1841, 3,309. It is situated between two steep ranges of hills, which enclose it on every side except the S., where it is open to the sea. From its sheltered situation, freedom from fogs, and the beauty of its surrounding scenery, Sidmouth has long been a favourite watering-place, and was frequently visited by George III., his queen, and court. The port was formerly of some consequence; but being choked up by sand, it is now accessible only by small vessels. The sands, however, have contributed to its popularity as a bathing place; and it has a handsome promenade on the beach, warm baths, good assembly, reading, and billiard rooms, and the other establishments usual at such places for the accommodation of visitors. The parish church, an ancient building, belonged, in the 13th century, to St. Michael's monastery in Normandy; it contains a monument to Dr. Currie of Liverpool, the first and perhaps, also, the best biographer of Burns. The living, a vicarage, in the patronage of the present incumbent, is worth 481*l.* a year. There are Baptist, Independent, and Unitarian chapels, a national school, several charities for the relief of the poor, a theatre, &c. Petty sessions for this and the neighbouring par. are held monthly at Sidmouth; and courts-leet and haron, at which the peace-officers, &c., are chosen, are held annually. Sidmouth gives the title of viscount to the Addington family. Markets on Saturdays. Fairs, Easter Monday and Tuesday, and third Monday in Sept., for cattle. (*Parl. Reports*, &c.)

SIENA, or **SIENNA**, (an. *Sena Julia*), a city of central Italy, Grand Duchy of Tuscany, cap. prov. of its own name, on three small hills, between two tributaries of the Ombrone, 30 m. S. by E. Florence. Pop., in 1843, 20,637. The neighbouring country is rugged and naked; but the city itself is embosomed in trees, and entered by a fine avenue, which gives it an agreeable and imposing appearance from without. Its streets, however, are narrow, steep, and uneven; and its houses, though often dignified with the title of palaces, are built of

brick, and are nowise remarkable for their architecture. The inhabitants are active, intelligent, and industrious.

"Though fallen from its former rank, as a republican city with 150,000 inhabs. (?), to that of a provincial town, with the melancholy title of the capital of the Maremma, Sienna "exhibits no signs of decay, but has, on the contrary, every appearance of active industry, with scarcely any beggars; the streets are well paved and very clean; the shops numerous and well supplied; the people well-dressed, and the women remarkably graceful and good-looking." (*Sénonod, Tour, &c.*, 571.) The principal public building is the cathedral, a vast, and, on the whole, magnificent Gothic edifice, founded in the 13th century, though not wholly of one date, and built in alternate courses of black and white marble. It has been severely, and, we believe, justly, censured by Forsyth for its incongruousness, want of taste, and barbarous emblematic devices. Over the arches supporting the nave is a series of the heads of popes; and the pavement is a kind of mosaic-work, much of which is very beautiful. The sacristy is adorned with a history of Pope Pius II., partly painted by Raphael at a very early age, and partly from his designs; and in the same room is a most beautiful antique group of the three graces. (*Wood's Letters*, i. 315.) Under this building is a subterranean church, which, if the cathedral, as is affirmed, stand on the site of a temple of Minerva, is, most probably, of remote antiquity. The churches of St. Dominico and St. Catharine, the hospital, city hall, and theatre, are worth notice. The city hall is in the great piazza, a sloping semicircular space, laid out in walks, ornamented with statues, and forming the principal lounge of the inhabs. The citadel, facing the main street, has an esplanade and ramparts, planted with trees, which also form favourite public walks. The antiquities include a Roman gate, the remains of ancient walls, &c., and it has a fountain celebrated in Dante's *Inferno*, and several good public and private galleries of paintings.

Sienna has some reputation as a seat of learning. Its university, founded in 1330, has a library of 25,000 vols., and had formerly 60 professors. Its importance has greatly declined; but it is still celebrated as a school of medicine, and may have about 300 pupils. It has, also, an ecclesiastical and several other seminaries (including some for *pugilistic science* (for which Sienna was renowned in the 13th century), and various academies, and learned societies, among which last are the *Rossi*, and *Intromati*, considered the oldest establishments of their kind in Europe. The Siennese pique themselves on speaking the Tuscan language in its greatest purity.

Sienna, which is an archbishop's see, has about 40 woollen factories, besides manufactures of hats, paper, leather, &c. Its chief trade is, however, in corn and other agricultural produce, and the marble of its vicinity. Augustus sent thither a Roman colony, previously to which this city appears to have been insignificant, though boasting of very high antiquity. In the middle ages it was, like Pisa, Florence, &c., the cap. of a republic, constantly at war with its neighbours; and it was generally flourishing and independent, till Philip II. of Spain took and conferred it, with its territory, on Cosmo I. of Florence. The French took it in 1808; and, previously to 1814, it was the cap. of the dép. of Ombrone. No fewer than 7 popes, including Pius II., Gregory VII., and Alexander III., with Socinus, and other eminent individuals, have been natives of Sienna.

SIERRA-LEONE, a colonial establishment of Great Britain, on the W. coast of Africa, consisting of a peninsula, about 25 m. in length, N. and S., washed by the Atlantic on the N.W. and S., and partially bounded on the E. by a bay formed by the Sierra Leone river. Free Town, the cap., on the N. shore of the peninsula, is in lat. 8° 20' 40" N.; long. 13° 15' W. It had, in 1838, a pop. of nearly 42,000, all black or coloured, except about 100 Europeans. The peninsula consists principally of a range of conical mountains, from 2,000 to 3,000 ft. in height, surrounded by a belt of level ground, from 1 to 5 m. in breadth. This is probably the most unhealthy situation in which Europeans have ever attempted to establish a settlement. The principal characteristic of the climate is its extreme humidity. The enormous quantity of 314 inches of rain appears to have fallen at Sierra-Leone during three months of 1838, and more fell in two successive days, the 22d and 23d of August, than in Britain throughout the entire year! There are two seasons, the wet and the dry. At Sierra-Leone and the Isles de Loss, the former extends from May to Nov., and at the Gambia from June to Sept. or Oct., and is always ushered in and carried off by tornadoes. Nothing can exceed the gloominess of the weather during this period; the hills are wrapped in impenetrable fogs, and the rain falls in such torrents as to preclude all exercise and amusement out of doors. At this period fevers of nearly every type, dysenteries, liver complaints, and other diseases, usually make their appearance; though they are so prevalent at all times that they can scarcely be said to belong exclusively to any season. During the 18 years,

SIERRA-LEONE

from 1819 to 1823, every white soldier in the colony was, at an average, three times a year under hospital treatment, and nearly half the force perished annually; and in 1823 and 1824, when the mortality was at its height, three fourths of the troops were cut off! To accept a situation in Sierra-Leone has, in fact, been little else than a species of suicide. Nor is the destructive influence of the climate confined to the whites only; the blacks, though in a less degree, are affected by it, and often die in great numbers. (See *Tulloch, Report on the Health of the Troops, &c.*)

Objects of the Colony.—This colony was founded in 1787, partly as a commercial establishment, but more from mistaken and ill-considered notions of humanity. Being intended to consist principally of free blacks, who were to be instructed in the Christian religion, and in the arts of Europe, it was supposed it would become, as it were, a focus whence civilization might be diffused among the surrounding tribes. About 1,200 free negroes who, having joined the royal standard in the American war, were obliged, at the termination of that contest, to take refuge in Nova Scotia, were conveyed thither in 1793. To these were afterwards added the Maroons from Jamaica; and,

millions, independently of the enormous sacrifice of life, St. George, or Free Town, the cap., is on the S. side of the estuary of the Sierra-Leone river, being surrounded on all other sides by an amphitheatre of mountains about 1 m. distant. The town and par. had a pop., in 1823, of 13,522. Its houses are mostly of wood, and disposed in broad and regular streets; around it are the country-houses of the white residents. The drainage of the town has of late been materially improved, but without much perceptible effect on its salubrity.

The villages dispersed in different parts of the colony consist of huts, built of wood and thatched with straw, so light that they are easily moved from place to place. The woods and mountains are infested with a great variety of wild animals, and the rivers swarm with alligators. Insects are so numerous and offensive as to be really a plague.

The settlements on the Gambia consist of St. Mary's Island, at the mouth of the river; area, 8 sq. m.; and M'Carthy's Island, about 200 m. up the river. Aggregate pop., in 1829, 4,494, of whom only 49 were whites. The trade of this settlement, though inconsiderable, is of more importance than that of Sierra-Leone, the value of the exports, in 1839-40, having amounted to 134,889*l*.

The Cape Coast command, E. E. of Sierra-Leone, consists of the stations of Cape Coast Castle (which see), Dixcove, Annamaboe, Accra, &c., along the Ashantee coasts. The climate is nearly as insalubrious as that of Sierra-Leone; but since 1823, British troops have not been sent to die in these settlements, the defence of which has been entrusted to a native force of about 900 men. The trade of this part of the coast is of considerably more importance than that of Sierra-Leone, the value of the exports, chiefly palm-oil, dye-woods, Guinea grains, gold-dust, and ivory, having amounted, in 1840, to 255,008*l*. An active trade in palm oil appears to have been growing up of late at the river Bonny. (*Tulloch's Reports; Report on the Colonies of W. Africa, 1841, &c.*)

SIGMARINGEN (HOHENZOLLERN), one of the minor principalities of Germany, which, with Hohenzollern-Hechingen, lies mostly between lat. 48° and 49° 30' N., and long. 8° 25' and 9° 30' E., inclosed by Württemberg on all sides except the S., where it touches the territory of Baden. H.-Sigmaringen is separated into two portions by H.-Hechingen: its S. portion is watered by the Danube, and the N. by the Neckar, &c. It has an area of 40 sq. m., with a pop., in 1850, of 42,000, nearly all Rom. Catholics. Except in the S. the soil is generally poor; still, however, rather more corn is grown than is required for home consumption. Potatoes, flax, and fruits, are also grown; but the chief wealth of the state consists of its timber, cattle, and hogs. The rural population is partly occupied in manufacturing cotton and linen cloths, and hardware. Since 1833 it has had a constitutional government; but Berghaus does not say how the representative assembly is constituted. Appeal from the high court at Sigmaringen lies to the superior court at Stuttgart. The revenues of the prince amount to about 800,000 florins a year, partly derived from his estates in Holland. The contingent to the army of the Germ. Confed. consisted of 256 men. The cap., Sigmaringen, on the Danube, has a pop. of 1,400. There is no larger town.

Hohenzollern-Hechingen has an area of 120 sq. m., with, in 1850, a pop. of 30,500. It is mostly mountainous, and cattle breeding forms the chief occupation of the inhabitants. It has a constitutional assembly formed of 3 representatives for the town of Hechingen, and 10 for the rest of the prov., and a superior law court, made to the high revenue, 190,000 *fl*. a Confed. 145 mem. It has 2,000 inhab., whom manufactures, ste in the full diet of as, Lippe, Waldeck, th place and 1 vote verignty was ceded to Prussia.

SILESIA, an important and valuable prov. of the Prussian dominions, having N. the prov. of Posen, E. Poland and Cracow, S. Austrian Silesia, Moravia, and Bohemia, and W. Saxony and Brandenburg. It lies between 49° 40' and 53° N. lat., and 14° 25' and 18° 12' E. long., and has an oblong shape, extending N.W. and S.E. about 34 m. Area, 15,711 sq. m. Pop., in 1848, 2,065,809, of whom 1,588,216 are Protestants, 1,476,908 Catholics, and 30,680 Jews. The proportion of Protestants to Catholics has increased considerably since the Prussian conquest. Principal towns, Breslau, Liegnitz, Glogau, Gorlitz, Neisse, Glatz, Oppeln, &c. It is divided into three regencies, and these again into 57 circles. Surface rugged and mountainous along its S. and S.W. frontier, but in other parts it is either flat, or but slightly undulating; this is particularly the case on the E. side of the Oder. The river now mentioned traverses the whole length of Silesia; and, being navigable for barges almost

be bent on prosecuting, without regard to expense, a trade with barbarous uncivilized hordes, while they contribute to the neglect or suppression of the incomparably more extensive and beneficial intercourse we might carry on with the opulent and civilized nations in our immediate vicinity. We are bold to say that the equalisation of the duties on Canadian and Baltic timber, and the abolition of the existing restraints on the trade with France, would do ten times more to extend our commerce than the discovery of 50 navigable rivers, and the possession of as many forts or factories on the African coast.

The government of Sierra-Leone is vested in a lieutenant-governor, assisted by a legislative council of 5 official mems. The chief justice presides in the supreme court of law, held alternately in the course of the year at the different stations under his command; and there are mixed commission courts for the adjudication of vessels taken in the slave-trade. The colony is subdivided into 6 districts and about 16 parishes, in each of which are one or more schools on the Lancasterian or the national system. Total military force (1841) 306 men, besides militia, &c. Total public revenue of Sierra-Leone and Gambia in 1839, 30,000*l*; expenditure, 108,066*l*. In fact this wretched dependency has cost the British public several

to the extreme S. limits of the province, it forms a valuable channel of communication. The other great rivers, the affluents of the Oder, are the two Neisses and the Bober on the S., and the Malapane and Bartach on the N. Soil very various, being in many parts loamy and highly productive, and in parts marshy and sandy. Great part of the regency of Oppeln is covered by vast forests. Principal products, corn, flax, and hemp, produced in very large quantities: the stock of sheep amounts to about 2,800,000 head; wool, of a very superior quality, now forms, next to linen, the principal article of export from the province: among the other products are beet-root sugar, timber, madder, tobacco, silk in small quantities, &c. Silesia is rich in mineral products. Coal is found in many parts, particularly in the vicinity of Schweidnitz, and Neisse, Glatz, &c. There are also valuable mines of iron, lead, zinc, copper, &c.

Manufactures are important and valuable. Linen is the principal product; but for some years past it has been declining, the cotton manufacture having grown up in the interval to a considerable state of advancement. The woollens manufactured are generally coarse, but they employ a considerable number of hands. No accounts have been published, on which any reliance can be placed, of the products and values of the different manufactures established in Silesia. The condition of the inhab. of this prov. has been vastly improved, both as respects their command over the necessities and conveniences of life, and their intelligence, since they became subjects of Prussia.

An intelligent observer, speaking of Silesia, observes, "In a country where linen is a staple commodity, the majority of the men are weavers, which trade they often exercise in conjunction with their employment as agriculturists; and the women, without exception, are spinners of flax, for we frequently see the better classes pursuing their thread-making occupation, not only in the saloon, but in the promenade, and the lower orders in their huts and on the high road, even while their heads are heavily laden with provisions for the market; but instead of the wheel they use the distaff, which, I was informed, was the prime cause of the superior excellence of the Silesian linen, as the thread is by this process rendered more soft, round, and less inclined to break. There is, however, a wide difference between the inhab. of Silesia descended from German colonists and the native Slavonians, particularly those who people the districts on the frontiers of Poland. The former are industrious, cleanly, and manufacturing; while the latter are debased by ignorance, mendicancy, and superstition; they also resemble their neighbours the Poles, not only in their language, which is a species of Polish patois, but in their sheep-skin jackets and greasy kappetas, neither of which are ever allowed to contaminate soap and water: another point of similarity is their inordinate attachment to bodka, and a deep veneration for Madonnas, saints, and crucifixes. But, perhaps, no distinctive trait of manners more characterises both than their humiliating mode of acknowledging a kindness, their expression of gratitude being the servile 'Upadam do nog' (I fall at your feet); which is no figure of speech, for they will literally throw themselves down and kiss your feet for the trifling donation of a few halfpence. How abject is the state to which feudal vassalage and superstition have reduced this people!" (*Germany and the Germans*, vol. 1.)

SILISTRIA (Turk. *Dristra*), a city of European Turkey, prov. Bulgaria, cap. sanjak, on the Danube, 63 m. E.N.E. Rustchuk. Pop. estimated at 20,000. (*Stctm.* &c.) Silistria is a strong military post, and resisted the attempts of the Russians in 1828, though they took it after a nine months' siege in 1829. When visited by Mr. Elliott, in 1837, it was in their hands, having been one of the pledges given by the Turks for the payment of the sums due to Russia. New ramparts lined the whole bank of the river, and an extensive island opposite the town was covered with provender for cavalry horses; while 8,000 regular troops garrisoned the fort. Under a strong lunette were posted a sufficient number of pontoons to form a *pont volant*, requiring only three hours to be united so as to form a complete military communication between the two banks. (*Travels in Turkey*, &c., i. 185, 186.) Since then Silistria has been restored to the Turks. The town is ill laid out, and many of the houses are in ruins. The citadel, several mosques and public baths, and a large bonding warehouse and custom-house, are the chief buildings. The inhabitants exchange timber and cattle with the Wallachians for salt and hemp; but their trade is not of much consequence. Near the city are the remains of some fortifications thrown up during the Byzantine Empire.

SIMBIRSK, a government of European Russia, on both sides the Wolga, having N. the government of Kasan, E. Orenbourg, S. Saratoff, and W. Penza and Nijegorod. Area, 24,000 sq. m. Pop. in 1846, 1,518,900. It consists of a gently undulating plain, having a black, and generally very fertile soil. Besides the Wolga,

it is watered by the Sura and other affluents of the former. Climate in extremes, the summer being hot, and the winter cold. The Wolga is annually frozen over for about five months. Rye, wheat, and other grain, are raised in quantities more than sufficient for the consumption. Hemp is largely cultivated, with flax, tobacco, poppies, &c. Except among the Kulmucks, the rearing of cattle is not much attended to. In the N. forests are abundant. Distilleries numerous; and besides the coarse goods manufactured by the peasants, there are establishments for the manufacture of cloth, coarse linen and canvass, and coverlets, with glass-works, soap-works, candle-works, &c. (*Schmitzler, La Russie*, &c., p. 676, &c.)

SIMBIRSK, the capital of the above government, on the Wolga, on an isthmus between it and the Sviaga, lat. 54° 18' 49" N., long. 48° 22' 15" E. Pop. above 12,000. It stands partly on an eminence, which commands a fine view, and partly on a plain. Streets broad and straight; houses mostly of wood, but neat and commodious inside. There are numerous churches, which, with one exception, are all of stone, and two convents. The town is in a fertile country; and, besides large quantities of corn, exports the produce of the fisheries on the Wolga. It is a good deal resorted to by the surrounding nobility.

SIMPHEROPOL, or AKMETCHET, a town of European Russia, in the Crimea, of which it is the capital, 40 m. N.E. Sevastopol. Pop. 4,200. It stands in a fine but not very healthy situation on the river Saighir, and consists of two parts, one new built by the Russians, in the European style, the other, old and occupied by the Tartars. The streets in the former are wide and regular; and it contains the government offices, and a cathedral, said by Dr. Lyall to be by far the handsomest ecclesiastical edifice he had seen in Russia. (1.142.) Within the last few years some improvements have been made in the Tartar part of the town, but the streets continue to be narrow, crooked, and filthy, and it has a mean, miserable appearance.

The celebrated traveller and naturalist Pallas lived for 15 years in this town. It was his own wish to emigrate thither, and to enable him to gratify it, the Empress Catherine II. made him a present of an estate in the best part of the peninsula. But being cut off from the society he had enjoyed in Petersburg, and exposed to family annoyances*, Pallas became dissatisfied with the country and with the climate he had so highly panegyrised. Having sold his estate, he left Simpheropol in disgust in 1811, and returned, after an absence of 42 years, to his native city Berlin, where he died in the course of the same year. (*Biographie Universelle*, art. *Pallas*.)

SIMPLON, a celebrated pass over the Alps, where a magnificent road was constructed by order of Napoleon, establishing an easy carriage communication between Geneva and Berne, in Switzerland, and Milan. (*See* art. *ALPS*, Vol. I. 67.)

SINAI (MOUNT), a mountain of Arabia, near the Gulph of Suez, or upper part of the Red Sea, famous for its connection with some of the most memorable events of sacred history. It is generally supposed to be identical with the mountain called by the Arabs *Djebel Mousa*, or Mountain of Moses, or simply *El Tor*, the Mountain, in the peninsula between the Gulphs of Suez and Akaba, in about lat. 28° 25' N., long. 34° 10' E. The group of mountains to which Sinai belongs, and which also includes Mount Horeb, Mount St. Catherine, and other remarkable summits, is surrounded on all sides by deserts occupied only by tribes of Bedouins, or wandering Arabs. The mountains are penetrated by deep chasms, edged by bare perpendicular ledges of rock; and the whole has a singularly wild and sterile appearance.

The convent of St. Catherine, founded by the Emperor Justinian, in a valley on the slope of the mountain, is the halting place whence pilgrims set out to ascend to the summit. Being exposed to the attacks of the Arabs, it looks more like a fortress than a convent. It is an irregular quadrangular edifice, surrounded by high and solid walls, and covers a considerable extent of ground. To prevent being surprised by their troublesome neighbours, the entrance gate, which is rarely opened, is built up; and on ordinary occasions all access to the convent is by an entrance about 30 ft. from the ground, to which travellers, provisions, &c., are raised in a basket made fast to a rope, pulled up by a windlass. The interior of the convent presents little remarkable, all the apartments and chapels being built of rough stone, without symmetry or order, communicating by crooked and dark passages. The Church of the Transfiguration alone possesses any pretensions to magnificence. It is 80 ft. in length, and 53 in breadth, paved with marble, adorned with a variety of figures. The event to which it relates is represented in mosaic. But the grand treasure of this church, and that which is supposed, by zealous Catholics, to confer on it peculiar sanctity and importance, is

* Dr. Clarke, who seems to have regarded every opportunity of traducing the government of Russia as a God-send, ascribes these annoyances to its agency! But Lyall has pointed out their true origin. (*Lyall in loc. cit.*)

the possession of the relics of St. Catherine, borne by angels to the neighbouring mountain, which still bears her name, and subsequently collected and deposited in a marble sarcophagus in this building! The skeleton of the hand, covered with rings and jewels, is the only portion of the remains of the saint that is exhibited to her faithful votaries.

Mount Sinai, as every one knows, is almost as famous in the sacred history of the Mohammedans as of the Jews; and it is a curious fact, that there is a Mohammedan mosque within the precincts of this convent. It has also an excellent garden at a little distance, which is reached by a subterraneous passage, secured by iron gates. It produces fruits, plants, and vegetables, in the utmost profusion. The climate is temperate, in consequence of the elevation; and snow even falls in winter.

The ascent to the mountain, which lies through a ravine to the S.W., commences close to the convent. It is steep, but the labour of ascending has been greatly facilitated by rude steps cut in the rock. At the height of about 500 ft. from the convent is a spring of fresh and cold water, covered by a rock, which protects it from the sun and rain. After ascending a little higher, the traveller gains the summit of Mount Horeb, which forms, to use the expression of Laborde, a kind of breast, from which Sinai rises. "Continuing our route from this halting-place by a path, still more rugged and steep than before, we arrived in about 45 minutes at the summit of Sinai, the apex of a peak not more than 50 yards across at its widest part." (*Wellsted*, ii. 95.)

The height of Mount Sinai has been variously estimated, but according to observations taken by Mr. Wellsted, it may be estimated at about 7,500 ft. above the level of the sea, and about 2,500 ft. above the convent of St. Catherine.

On the summit of the mountain is a dilapidated church, which tradition represents as founded on the spot where, amid thunder and lightning, and the smoke of the agitated mountain, Moses received the Decalogue from the hands of the Almighty. (*Exodus*, cap. xx.) Truth, however, is seldom unaccompanied with error; and but a few yards distant from the church are the ruins of a mosque; this mountain, by a singular coincidence, being hallowed alike in the estimation of Jews, Christians, and Mohammedans.

"It seems," says Sir Frederick Henniker, "to a person on the summit of Sinai, as if the whole of Arabia Petraea had once been an ocean of lava, and that, while its waves were literally running mountains high, it had suddenly been commanded to stand still." Mount Sinai itself, Mount St. Catherine, which is still higher, and the adjacent mountains, rise in sharp, conical, granite peaks; and from their steep and shattered sides huge masses have been thrown down. The prospect from the summit of Sinai is most extensive: the Gulf of Akaba, on the one hand, and that of Suez on the other, with Mount Agrib, on the Egyptian coast, are distinctly visible. Barrenness and desolation are, however, its grand characteristics. "No villages and castles, as in Europe, here animate the picture; no forests, lakes, or falls of water, break the silence and monotony of the scene. All has the appearance of a vast and desolate wilderness, either grey, darkly brown, or wholly black." (*Wellsted*, ii. 98.) But it is the associations connected with the mountain, and the astonishing events of which it is believed to have been the theatre, that inspire those feelings of awe and veneration felt by all who have either beheld or ascended Mount Sinai.

Considerable doubts have, however, been entertained whether the mountain now described be really the Mount Sinai of the Pentateuch. It might be expected that the summit of the mountain should exhibit some traces of the stupendous phenomena that are said to have accompanied the manifestation of the Divine presence. But, according to Burckhardt, neither Sinai, nor any of the adjoining summits, exhibits any traces of volcanic action. It is supposed by some that the *Djibbel Katerin*, or Mount St. Catherine, has the best title to be regarded as the true Sinai.

There are really, however, no means by which to arrive at any satisfactory conclusions on the subject. All that can with confidence be stated (for monkish legends and traditions go for nothing), is that Mount Sinai must be somewhere in this vicinity; and that though the hypothesis, that the *Djibbel Moussa* and the Sinai of the Bible be identical, be not free from difficulties, it is as much so, perhaps, as any other that has been advanced in its stead. (*Calmét, Dictionnaire de la Bible*, art. *Sinai*; *Shaw's Travels*, p. 316., 4to ed.; *Laborde's Arabia Petraea*, p. 242.; *Wellsted's Arabia*, ii. 90., &c.; *Burckhardt's Arabia*, &c.)

SINDE, an extensive country of N.W. India, between Hindostan and Beloochistan, comprising the lower course and delta of the Indus; extending between lat. 23° and 29° N., and long. 66° and 72° E.; having N. the Punjab and Bahawalpoor territories, E. Rajpootana, S. the Runn of Cutch and the Indian Ocean, and W. Beloochistan

and Cutch-Gundava. Its length, N. to S., is about 280 m.; its breadth is very variable; but its entire area may be about 60,000 sq. m.; and Burnes estimates the pop. at about 1,000,000. Mr. Elphinstone dwells on the striking resemblance between this country and Egypt. "One description might serve for both. A smooth and fertile plain is bounded on one side by mountains, and on the other by a desert. It is divided by a large river, which forms a delta as it approaches the sea, and annually inundates and enriches the country near its banks. The climate of both is hot and dry, and rain is of rare occurrence in either country." But here the similarity ends. Egypt has populous towns, numerous canals, and abundant harvests; while in Sind, such has been the barbarism of the country and government, that miserable villages are even few, and agriculture languishes equally with commerce; the policy of the ameer being to keep the land in a state of nature, that their territories might not attract the cupidity of the surrounding tribes. (*Burnes*, i. 244.) The various products of Sind differ little from those of the rest of India. Rice, indigo, tobacco, and sugar-cane are among the principal: vines, figs, pomegranates, and even apples, are successfully raised at Tatta; and wheat, barley, and the common Indian grains, are grown to great perfection in Lower Sind. There are vast herds of horned cattle and sheep, which are generally larger than those of Hindostan. Camels and buffaloes are numerous. Game is very plentiful, though wood is scarce. Salt and saltpetre effloresce almost every where on the soil.

The main exports are salt, rice, ghee, hides, saltpetre, cotton, oil, shark's fins, bark for tanning, &c.; with assafoetida, and other gums; Cashmere shawls, saffron, horses, leather, musk, alum, and various drugs and gems from the countries on the N. and W. The principal imports from India are metals, ivory, tea, tutenague, and other China wares, chintzes, broad cloths, arms, and other Indian and European manufactures; but particularly opium, in transit from Malwah to Bombay. From Persia and Arabia the Sindians also obtain silks, swords, carpets, dates, rose-water, coffee, &c. (*Pottinger*.) Nearly all the trade centres in Kurachee on the Beloochistan border; there is little commerce any where else, even on the Indus. The only encouragement the chiefs gave to any trade was to that in opium, and on it they levied the enormous duty of 250 rupees the camel load. The revenue from this article was estimated to amount to 7 lacs rupees a year.

The chief towns are Tatta, Hyderabad, Kurachee, Kyrpoor, Shikarpore, Larkhann, &c. The Sindians are of a middle size, slim, and darker than most of the inhabs. of Hindostan. Most of them are Mohammedans of the Shtah sect. There is little to praise in their character; they have nearly all the worst vices of an enslaved people. They are, however, brave in the field, and, unlike other Asiatics, pride themselves on being foot soldiers, preferring, also, the sword to the matchlock.

Previously to its annexation to the British territory, Sind was governed by ameers, or military chiefs. A British residency was established amongst them, which, after the disasters in Afghanistan, they had the temerity to attack. This led to hostilities in which the ameers were signally defeated by Sir C. Napier in the well-contested actions of Meanee and Hyderabad. The country was finally annexed to the Bombay presidency in 1845. (*Burnes's Bokhara*, &c., i. 206—259.; *Pottinger's Beloochistan*; *Geog. Journ.*, vii., &c.)

SINGAPORE, a settlement belonging to Great Britain, in S.E. Asia, consisting of a small island at the S. extremity of the Malay peninsula, incl. the town of the same name; the latter being in lat. 1° 17' N., long. 103° 50' E. The island is of an elliptical form: greatest length, E. and W., about 27 m.; average breadth, 11 m. Area, estimated at 275 sq. m. Pop., in 1836, 29,984; of whom 13,749 were Chinese settlers, and 9,632 Malays. And in 1850, about 50,000, of whom nearly a half are Chinese. The island is separated from the main land by a strait, which, though scarcely $\frac{1}{2}$ m. in breadth, in its narrowest part, was the route usually followed by ships between India and China in the early stages of European navigation. But the grand commercial highway between the E. and W. portions of maritime Asia now passes along the S. side of Singapore, between it and a chain of desert islands about 9 m. distant; the safest and most convenient track being so near to Singapore that ships, in passing and repassing, approach close to the roads. The town is wholly indebted for its rapid rise and growth

market order, in the town of a Greek cross, has some good paintings, but nothing else very remarkable. The streets are broad, and the town has a well appearance; but it is insufficiently supplied with water, and is said not to be very healthy.

Stratigra is the seat of the greatest of the Italian fair. The fair commences on the 14th of July, and should terminate on the last day of that month, but it usually continues 4 or 5 days longer. The duties on goods brought to the fair are extremely moderate and every thing is done to promote the convenience of those frequenting it. All sorts of cotton and woollen goods, lace, iron and steel, hardware, jewellery, bric-a-brac, liquors, raw and refined sugar, dried fish, olives, oil, &c. are brought thither by the English, French, Austrian, American, &c. These are exchanged for the various raw and manufactured products of Italy and the Levant, consisting, among others, of raw silk, and wrought silk, all fruits, olives, olive oil, carmine, sulphur, &c. The value of the imports is some recent years has been estimated at about 2,000,000 francs; and exports in credit of 30 million francs, or 60 of very nearly, 100 lbs. Sterling = 770 lbs. Sterling. The oil, or olive, measures 20 to 30 English bushels.

The part belonging to the town, at the river's mouth is the only for small vessels. Stratigra is a bishop's see according to Ptolemy, it was subdued by the Russians, A. D. 1011. Having captured the castle of Maritsa, it was taken and sacked by Pempy (Commenal Dux, Grand Duke July 1, 1811).

BITTOW or BITTOVA, a town of European Turkey, prov. Bulgaria, on the Danube, which is here more than 1000 ft. W. S. W. Danubius. Pop. estimated in Habsburgian State, at only 14,000, but by other authorities at 20,000 and upwards, including many Armenian and Greek merchants. It occupies a large extent of ground, surrounded by a palisade and a dry ditch. Mr. Quia says, "Bittova is beautifully situated. A range of well wooded hills surrounds a tongue or two to the W. and towards a considerable way along the right bank of the Danube. The town, rising at the corner's edge, stands to way up the inclinations of the steepness. After ascending for a while, the houses are lost; then they appear higher up, and the whole is protected by a Citadel, which overlooks the country." (From Pempy on the Danube, 1811). Bittova has some trade in leather and cotton. It was here, in 1793, that a treaty of peace was signed between Austria and Turkey after the latter had lost almost herself to the Russians. (From Travels in Germany and Russia, &c.)

BITTOW, BOTTEN, a town and par. of England, on Kent, in the ferry boat Midam, on the road from London to Canterbury, 10 m. W. by N. the latter. Area of par. 1,300 acres. Pop. in 1841, 2,500. It contains chiefly of one wide street, running along the high road, and has several good houses. The parish church, a specimen building, has been mostly removed since 1788, when it was destroyed by fire. The living, worth £11 a year is in the gift of the archbishop of Canterbury. In 1810, Queen Elizabeth incorporated Bittow under a mayor and jurats, with the privilege of sending 2 members to the H. of C., and of holding a weekly market and fair, but these privileges seem never to have been exercised, except as respects the fair, which are held on Wed. Monday, Tuesday, and Wednesday, and Oct. 25. The markets are held once a month.

BITACH, or BITACH BIA, the Polish name of

Aug. 2, Oct. 12, and Dec. 11 and 12. Post-office returns, in 1850, 1851, to 1854, 1855. A branch of the Agricultural Bank was opened in 1856.

BITTON, a market town and par. of England, W. riding in York, wapentake Hamwold and Eborac, 2, 40. In the town there is a date of 1700, and on the 14th, 18 m. W. York. Area of par. 10,700 acres. Pop. in 1841, 2,575. The town, consisting principally of one spacious street, is built wholly of stone from the neighbouring hills. The par. church has some monuments of the Cresset family. The living is a vicarage in the gift of the Dean and Chapter of Christchurch, in 1811 a year. The Friends, Independents, and Wesleyans, have meeting houses, and there is a flourishing grammar-school founded in 1588, the pupils of which are sent to the universities of Lady E. Hastings at Queen's College, Oxford, and to two exhibitions in Christ's College, Cambridge. The town has also another endowed, or Church school a national school &c.

Here the church is Bishop's Castle, the seat of the Earl of Thanet, supposed to have been originally built soon after the conquest. Though not well placed for a fortress, it was of more consequence in that capacity during the reign of Charles I. It was dismantled in 1646, but is now a splendidly fitted up noble residence. Bitton is governed by a constable elected annually at the township court, and the general quarter sessions for the W. riding are held in its town hall. It has some paper and cotton mills, and a considerable trade in corn, sheep, and cattle, much facilitated by the Leeds and Liverpool Canal, which passes close by the town. Market day Saturday. Fair March 25. Palm Sunday eve, Easter eve, and three Tuesdays next after Easter, for horses, cattle, and sheep; Whitson eve, May 2, May 20 and 21, for horses, oxen, and sheep, cattle, swine, and poultry.

BITTO, one of the Slavonian, which are. SLAVONIA or SCLAVONIA (Hungar. Feh-Gorag), a part of the Austrian empire, usually regarded as forming a part of Hungary and chiefly included within its military frontier, between the Drave and Danube on the N. and E. and the Save on the S. Dividing it from Bosnia, Serbia, and Turkish Croatia, and having Austrian Croatia on the W. Area, estimated at about 8,000 sq. m. pop. 250,000, principally Slavonians of the Greek church, but partly also German, including, Croats, and Jews. A branch of the Carpathian Alps, almost wholly of subterranean formation, runs S. and W. through Slavonia, but these mountains are of no great elevation, and a large part of the surface is flat. The plains are very fertile, though frequently unhealthily from the presence of excessive marshes along the large rivers. Wheat, rye, oats, barley, and most other grains, are produced in abundance, besides flax, hemp, tobacco, mulberry, &c. A good deal of strong wine is made especially in Slavonia. Fruit is extremely plentiful and there are vast orchards of plums where the beautiful figure of Slavonia is described. The soil ranges are covered with forests, consisting of deciduous oak, &c. The breeding of live stock particularly of horses, which find a large to the Danube is extensively pursued. The silkworms are raised, but it is not much raised. The prov. is said to produce iron, salt, sulphur and perhaps coal, but marble only is found in any quantity. Manufactures, mostly domestic, occupying some of glass and earthenware, jewelry, &c. The trade partly consists in the exportation of the raw produce of the prov., and partly in the transit of goods. The principal articles of export are cattle and horses, which go to the most distant parts of the Austrian empire, being skins, rye, wheat, honey and wax, galls, timber, &c. Slavonia is divided into 3 counties, and 4 military districts, chief towns, Buda, the cap., Peterwaradin and Pungas.

Slavonia and the Banat comprise the most important portion of Hungarian military frontier, the system of defence organized in which deserves some notice. The object has been to maintain at the least possible cost, along the whole Turkish frontier of Hungary a strong force to prevent might be employed for the purpose of quarantines and customs, and in war serve as a portion of the standing army. This has been effected as perfectly, that in peace nearly 60,000 men do duty along 300 m. of frontier; and they are only food and clothes themselves, but pay heavy taxes in money, tobacco, and perfume, also, a considerable quantity of labour without pay. The land acquired by governments along the whole of this district is held as 600 on the basis of military and civil service, from 50 to 60 acres constituting a lot. Each of these is bound to furnish and to maintain and equip, according to its size one or more men on arms. The lots are given to families composed of several members of which the eldest is the house father and who with the house-mother has the direction of the farm, the care of the house and the right to control the whole family. The lots cannot be sold, the land is entrusted for the maintenance of all the members of a family, and the profits, if any remain after the taxes and other expenses are

It is a town, which is situated from Bittow to within 10 m. of the town. 30 m. S. W. York. Pop. in 1851, 4718. It is a town, thriving town, and has a considerable retail trade. It has a par. church, a Roman Catholic chapel, a Methodist meeting house, several schools, a dispensary, market house, bar, and most houses, and widowed. Petty sessions are held on Wednesdays, and it is a constabulary and rural guard station. It has several large glass mills and a brewery. The exports which partly consist of corn, meat, fish, and provisions, are mostly shipped from Ostend. 3 m. lower down the river other ranges of 100 long land and outland. Markets on Wednesdays and Saturdays. Fair May 14, July 10.

defrayed, is divided among them. In most cases, many married couples, with their children, sometimes to the number of 50 individuals, live under the same roof, cultivate the same land, eat at the same table, and obey the same father. The border-family has to do civil service for the state, as in the repair of post-roads and bridges, draining of swamps, &c., one day per annum for every English acre, and 8 days a year for the village. The borderer's chief tax, besides the furnishing the uniform (government supplying the arms, boots, &c.), is the land-tax, amounting, for an entire fief, to from 15s. to 30s. a year. In time of peace, the man-at-arms repairs to his military station for 7 days at a time, where the family provides him with food. Besides this, he has the duty of transporting letters, as well as the money and baggage of his regiment, and of performing exercise. For the ordinary service, the number of men on duty amounts to 4,180. In times of disturbance on the Turkish side, or when the plague is drawing near, it is increased to 6,800, and in times of still greater danger, to 10,000. In time of war, the borderer must form a part of the regular army, and march out of the country if required. The regular disposable force amounts to 34,800 men; but if the reserve and the *landwehr* be called out, to 100,000. If driven to the last extremity, they can muster to the amount of 200,000 men. (*Csaplovics*.) By means of alarm-fires and bells, this immense force may be summoned together through the whole extent of the frontier in the space of 4 hours! The borderers are divided into 7 regiments. Every regiment receives its orders ultimately from the council of war at Vienna. The Hungarian Diet has no control over the levy and supply of these troops; and the schools, the language of the service, and many of the laws in the military border, are exclusively German." (*Paget's Hungary*, &c., ii. 93—103.; *Csaplovics, Gemalde von Ungarn*; *Oesterr. Nat. Encyc.*)

SLEAFORD (NEW), a market-town and par. of England, co. Lincoln, wapent. Flaxwell in Kesteven, on the Slea, 16 m. S.S.E. Lincoln. Area of par., 3,160 acres. Pop., in 1841, 2,392. The town consists principally of three streets, and has a prosperous appearance. The church, founded in 1271, is interesting for its architecture. The tower, at the W. end, is much the oldest part, and is early English; but surmounted by a spire, 144 ft. in height, of a later date. The aisles, transept, &c. are in the decorated, and the chancel and other parts in the perpendicular, style. The whole of the details of this church, in all its styles, are very good. (*Rickman's Gothic Archit.*) In the chancel are several monuments to the Carr family, one of whom founded and endowed a free-school in the town, and an hospital for 12 poor men. The school was closed from 1816 to 1835, during which period the school-house was rebuilt; in the latter year it was re-opened, when it had an income of 189*l.* a year. There are several other charities, particularly Alvey's school, for 40 children, which has received many endowments since that of its founder. (*32d Rep. on Charities*, part iv.) Formerly the bishop of Lincoln had a palace at New Sleaford, but it no longer exists. A new Gothic sessions house has lately been built, in which petty sessions are held; and various other improvements have been effected in the town. The living, a vicarage worth 170*l.* a year, is in the gift of the prebendary of Lincoln Cathedral. Market days, Mondays; fairs, Plow, Easter, and Whit Monday, for horses, cattle, and sheep; Aug. 13. for provisions; and Oct. 20. for cattle and sheep. (*Parl. Reports*, &c.)

SLESWICK (Germ. *Schleswig*), a duchy belonging to Denmark, comprising the S. part of the peninsula of Jutland, between lat. 54° 15' and 55° 30' N. and long. 8° 40' and 10° 10' E., having Jutland Proper to the N., S. Holstein, from which it is separated by the Eyder; E. the Baltic, and W. the North Sea. Area, including the adjacent islands, 3,450 sq. m. Pop., in 1845, 362,900. Surface low, and generally flat, being in parts varied only by a few undulating hills. Almost the whole of its western coast is either below or elevated very little above the sea, being defended from its irruptions (from which, however, it has frequently suffered much) by immense dykes and sluices. The country so protected consists principally of very rich marsh land, affording pasturage for large herds of very superior cattle, as well as great numbers of fine horses. In the interior the soil is sandy, interspersed with heaths, and not very productive, but on the eastern side it is fertile. There are no minerals of importance. The produce of corn, consisting principally of rye and barley, is sufficient for home consumption; and flax, hemp, and potatoes, are also grown. But the raising of cattle and horses forms the staple employment; and these, with butter and cheese, form the principal articles of export. The fishery is carried on to some extent. The deficiency of timber for fuel is compensated by the abundance of turf. The country is mostly open; but it is in parts inclosed with quickset hedges, and the farm-houses are neat, and have a comfortable appearance. The manufactures, which are unimportant, consist mostly of linen, hempen, and wool-

len fabrics, made in the peasants' cottages. Lace is produced at Tondern, and there are a few paper, tile, and other factories. Flensburg is the principal place of trade: Sleswick, Kiel, and Tonnigen, are the other chief towns. This duchy preserves several of its ancient laws and institutions; feudal vassalage, however, was abolished in 1805.

SLESWICK, a sea-port town of Denmark, cap. of the above duchy, at the bottom of the long, narrow gulph, or arm of the sea, called the Sley, 21 m. from its mouth, and 70 m. N.N.W. Hamburg; lat. 54° 31' 15" N., long. 9° 34' 45" E. Pop., according to Horschelmanns *Stein*, 11,000. Though irregularly built, its brick houses, neatness, and manner of building, make it look like a Dutch town. It has 3 churches, including the cathedral, with several monuments, and a remarkable altar-screen; several hospitals, a deaf and dumb asylum, schools for the poor, a patriotic union, and other societies, a nunnery, a savings' bank, with manufactures of lace, woollen stuffs, earthenware, &c. Its commerce has been a good deal increased since the improvements in the navigation of the Sley; still, however, it is accessible only by the smaller class of vessels. It was formerly a member of the Hanseatic league, and a town of some note as early as the 9th century. In its immediate vicinity is the castle of Gottorp, formerly the residence of the dukes of Holstein-Gottorp, and now occupied by the governor of the duchies of Sleswick and Holstein. (*Stein's Handbuch der Geog.*, &c.)

SLIGO, a par. co. of Ireland, prov. Connaught, having N. the Atlantic Ocean, E. the co. Leitrim, S. E. Roscommon, and S. W. and W. Mayo. Area, 434,887 acres, of which 168,711 are mountain and bog, and 8,260 water. Surface much diversified; but though it has a considerable extent of level rich land, it is, speaking generally, mountainous, rough, and boggy. There are a few pretty large estates; but a considerable portion of the co. is divided among small proprietors. The statements as to the mode of occupying land, its management, and the condition of the inhabs., given under the notice of the co. LEITRIM (which see), may be applied with little or no modification to this co. The great increase within the last few years in the amount of the exports from the town of Sligo, show that there must have been a corresponding extension of cultivation in this co. and the contiguous portions of Leitrim. But unhappily the extension, and even improvement of tillage in Ireland, is not always accompanied by any corresponding improvement in the condition of the occupiers, which is here extremely bad. The *con-acre* system (see *ante*, p. 40.) has made much progress in this co.; the competition for land is extreme; and the occupier of any overrented patch that may choose to part with it, never fails to get a considerable sum at "tenants right." Average rent of land, 10s. 8d. an acre. It has neither minerals nor manufactures of any importance. Principal rivers, Gavoge, Arrow, Awlmore, &c. It is divided into 6 baronies and 39 parishes, and returns 3 mems. to the H. of C., two being for the co. and one for the bor. of Sligo, the only town of any importance in the co. Registered electors for the co., in 1849-50, 380. In 1841, Sligo had 31,443 inhab. houses, 32,837 families, and 180,886 inhabs., of whom 89,563 were males, and 91,323 females.

SLIGO, a par. bor. and sea-port town, on the W. coast of Ireland, prov. Connaught, cap. of the above co., at the bottom of Sligo Bay, and at the mouth of the river Gavoge, 107 m. N.W. Dublin; lat. 54° 22' N. long. 8° 22' W. Pop., in 1821, 14,151; in 1841, 14,318. The town, which is of considerable importance, and increasing both in wealth and population, is intersected by the Gavoge, which has its source in Lough Gill, distant about 3 m. The larger portion, which is on the S. side of the river, is connected with that on the N. by 2 bridges. The streets are irregularly laid out, and those in the older parts of the town are narrow, dirty, badly paved, and badly lighted. Of late years, however, several new markets, warehouses, and lines of streets, have been erected; and it has a good deal of the bustle and appearance of a place of trade. Water is supplied by public pumps. The town has a library, 2 news-rooms, a small theatre, and a cavalry barrack. The ecclesiastical buildings comprise the par. churches of St. John and Calry; a large Rom. Cath. chapel, a Dominican convent, and places of worship for Presbyterians, Independents, and Wesleyan Methodists. The ruins of Sligo monastery deserve notice for their architecture and for a monument of O'Connor Sligo, who died in 1623. There are 2 par. schools, a school in connexion with the Board of National Education, one on the foundation of Erasmus Smith, and one under the Incorporated Society. The County Infirmary, Fever Hospital, and Dispensary, and a mendicity association, are within the town. A Lunatic Asylum is now (1850) being erected.

The bor., which was chartered by James I. in 1614, is divided, under the Irish Municipal Reform Act, 3 & 4 Victoria, cap. 108., into 3 wards, and is governed by a

mayor, 5 other aldermen, and 18 councillors. Shgo returned 2 mems. to the Irish H. of C., and since the Union it has sent 1 m. to the Imperial-H. of C. Area of parli. bor. 3,001 acres; of municipal do., 417 acres. Registered electors, in 1849-50, 603.

A board of commissioners, appointed under local acts, superintends the police of the town, and the improvement and regulation of the quays and harbour, with power to impose rates for those purposes. Under their management, the port has been a good deal improved. An extensive new quay and warehouses have been erected outside the bar; and though rather difficult of access, the port is now very tolerable. There are about 12 ft. water close to the quay, so that vessels of 250 and 300 tons come up to the town. The assizes and general sessions of the peace for the co. are held here; the latter four times in the year; and petty sessions every Thursday. The court-house, though a modern structure, is too small for the convenient despatch of business. The co. gaol, a large and well constructed building on the polygonal plan, is furnished with a treadmill. The Sligo union workhouse, built for the accommodation of 1,710 inmates, was opened in 1841.

The linen trade, which was formerly carried on with some spirit, is now nearly extinct. The town has several flour mills, a distillery, and four breweries. The markets for corn and butter, on Tuesday and Saturday, are held in buildings erected for the purpose. There is a valuable salmon fishery close to the town.

Sligo is the *entrepôt* of an extensive country, and has, in consequence, a considerable and increasing trade. The exports consist almost wholly of agricultural produce; thus, in 1835, the total estimated value of the exports amounted to 369,490*l.*; of which the value of corn, meal, and flour made 185,414*l.*, and that of provisions (beef, pork, &c.) 181,836*l.* The imports consist of colonial products, English goods, tobacco, wine, coal, salt, &c., for the use of the town and the country dependant upon it. Gross customs' revenue in 1849, 25,139*l.* Post-office revenue in 1849, 1,266*l.* Branches of the Bank of Ireland and the Provincial Bank are established in the town, which has also 3 newspapers.

The intercourse between the port and Lough Gill, and the surrounding country, by the Garvoe, is prevented by a dam thrown across the latter for the use of the large flour mills. This obstruction is much complained of, and will, probably, at no distant period, be removed. The country in the vicinity is highly picturesque, and has many fine seats. The pop. is comparatively respectable, and well off. (*Boundary and Railway Reports; Thom's Almanack, &c.*)

SMOLENSKO, a government of European Russia, between the 53d and 57th degs. of N. lat. and the 30th and 36th E. long., having N. the governments Pskof and Tver, E. Moscow and Kaluga, W. Witsepak and Moghilef, and S. Orlof and Tchernigof. Area estimated at 20,220 sq. m.; pop. in 1846, 1,170,600. Surface mostly an undulating plain, in some parts marshy; in the N. is a more elevated plateau, in which the Dniepr and several other rivers have their source. The soil is generally fertile, and more corn, principally rye, is grown than is required for home consumption. Hemp, flax, tobacco, and hops, are cultivated. Cattle breeding is less attended to; but a good many hogs are reared. The forests are very extensive, and are, in fact, the chief sources of wealth. Game is very plentiful; and bees are reared almost every where. Iron, copper, and salt, are found. Manufactures few, being nearly confined to leather, glass, wares, pitch, &c.; with sawing works, distilleries, and a few carpet factories in the cap. The raw produce of the government is exported, in large quantities, to Riga, Wilna, and Moscow. It is divided into 12 circles.

SMOLENSKO, a town of European Russia, cap. of the above gov., on the Dniepr, 230 m. W. by S. Moscow, lat. 54° 47' 11" N., long. 32° 3' E. Pop. nearly 10,000. It is situated on both sides the river, and is surrounded by a massive wall flanked with towers. It appears to advantage at a distance, but is in reality a poor town, the houses being mostly of only one story, and built of wood; but since it was burned by the Russians, previously to their evacuating it on the advance of the French in 1812, it has been partially rebuilt of stone and brick.

Smolensko has 3 cathedrals, in one of which is a bell weighing 350 cwts; 16 Greek churches; 3 convents; a Lutheran and a R. Catholic church; a seminary; gymnasium; a military school for nobles; several hospitals; and some carpet, hat, soap, and leather factories. In 1838, the erection of an iron pyramid was commenced here, intended to commemorate the resistance made by the town to the French in 1812.

Smolensko is of considerable antiquity. It has suffered numerous vicissitudes, but has always been a town of some consequence.

SMYRNA, an ancient and celebrated city and sea-port of Asia Minor, the greatest empo-

rium of W. Asia, on the W. side of the Meles, a stream which, though of small dimensions, has acquired an immortality of renown, at the bottom of the gulph of its own name (an. *Hermius Sinus*), lat. 38° 25' 36" N., long. 27° 6' 45" E. Its pop. may be estimated at from 120,000 to 150,000, more than half being Turks, and the rest Greeks, Jews, Armenians, Franks, &c. It is surrounded, at some distance, by an amphitheatre of lofty mountains, which leave it open only towards the sea; and immediately adjoining the city, on the W., is the ancient *Mons Pagus*, which commands a noble view. This eminence is now called the Castle Hill, from a citadel erected on its summit, in the 13th century, by the Emperor John Comnenus. "A triangular plain, spread at the foot of this hill along the shore, and the slopes of the hill itself, compose the site of Smyrna. One side extends along the shore from W. to E. for about 2½ m. The Turks occupy the upper part of the city, their streets hanging down the slopes of the hill; the Armenians are in the centre; the Jews have two or three different places around both; and the Franks spread themselves in the flat ground and close to the shore. Extending S.E. is a plain filled with gardens; and every part of the city is interspersed with shady trees." (*Burgess's Greece and the Levant*, ii. 67, 68.)

The view of Smyrna from the bay, rising amphitheatrically from the water's edge, backed by the hill crowned with its old castle, is grand and impressive. Unfortunately, however, its interior has all the odious features common to most Turkish towns. "If a first view be calculated to make a favourable impression, this is not confirmed by an inspection of the interior of the city. The Frank quarter is dirty, ill paved, and narrow; in addition to which, it is rendered almost impassable by long strings of camels and porters carrying huge bales of cotton. The houses (excepting those of the consuls and principal merchants, which are large and commodious) are miserably built; the sides consist often of planks; and when of bricks, the walls are too thin to keep out cold and damp. Neither windows nor doors are made to shut close; and if locks appear on the latter, it is too much to expect that they should be serviceable. There is a great lack of accommodation for travellers. The only inn in the town contains but a single decent room; and the noise of revelry is incessant. Besides this, there are three boarding-houses; but furnished lodgings are not to be procured, nor can furniture be hired for a few weeks or months. The apparatus commonly used for supplying warmth to the body in cold weather is a brazier placed under the table, which is covered by a large cloth held by each member of the family circle up to the chin, to prevent the heat from escaping. Grates and stoves have of late years been introduced; but they are still rare, and to be seen only in Frank dwellings. The shops are little dark rooms, but tolerably supplied with European articles. The bazaars, with their long covered rows of stalls, built with sundry precautions against fire, whose ravages are awfully common, are secured by iron gates closed at night. As to the rest, Turkish towns in general offer little variety, and the description already given of Constantinople applies to Smyrna, except as regards the finer buildings, greater extent, and gaudy exterior of the capital." (*Elliott's Travels*, ii. 34-36.) Smyrna suffered severely from a fire in 1845.

The principal buildings of Smyrna are, the bazaar and *bexestein*, or market-place; the vizier-khan, constructed of the marble ruins of the ancient theatre; the palace of the *mutesellim*, or governor, and the various mosques, churches, hospitals, &c. There is a large public hospital in the N.E. part of the Frank quarter, supported by the Greeks, Franks, and other Christians, which ranks high in Turkey for its school of medicine. Its buildings comprise a laboratory, and three sets of wards around a courtyard shaded by rows of trees. The castle on Mount Pagus is very extensive, and occupies the site of the ancient acropolis. This fortress has been frequently repaired by the Turks, and accordingly presents an incongruous intermixture of architecture; but it is now mostly deserted, and in ruins, though a few old cannons be still mounted on its walls. Within are some vaults and cisterns, supposed to be coeval with its foundation; and a large but abandoned mosque, formerly a church dedicated to St. Polycarp, bishop of Smyrna, who is supposed, though on no very good authority, to have suffered martyrdom near the same spot.

Smyrna was the seat of one of the seven Apocalyptic churches. (Rev. ii. 9.) And, according to Mr Elliott, "there is not one of these churches within whose precincts the trumpet of the gospel now gives so distinct and certain a sound. While Mohammed is acknowledged in 20 mosques, and Jews assemble in several synagogues, the faith of the Messiah is taught in an Armenian, 6 Greek, and 2 R. Catholic churches, and in 2 Protestant chapels, one connected with the English, the other with the Dutch consulate." (*Trav.* ii. 45, 46.) The Armenians have a large academy at Smyrna.

Being surrounded, as already stated, by an amphitheatre of mountains, which concentrate the rays of the sun and interrupt the breeze, the heats at Smyrna, from June to the middle of Sept., are usually intense; and if the *fatat*, or sea-breeze, fail, the inhab. are almost suffocated. This great heat and want of ventilation, joined to the filthy and crowded state of the streets and houses, and the want of any efficient precautions on the part of the authorities, seldom fails to generate the most destructive diseases; among which, the plague not unfrequently makes its appearance, and commits dreadful ravages. At such periods all commercial and social intercourse immediately ceases; and the Frank inhab. retire to and shut themselves up in their country houses in the surrounding villages. The Turks, who are firm predestinarians, have hitherto taken few or no precautions to counteract the progress of the infection, or to guard against it; but it is stated by late travellers that some change is now beginning to take place in this respect, and that the principal Turkish inhab. are slowly adopting some of the devices by which Europeans attempt to ward off the malady. (*Chandler's Asia Minor*, chap. 19.; *Burgess*, ii. 76.)

Port and Commerce.—Though frequently overthrown by earthquakes, and laid waste by hostile incursions, the excellence of her port, and her advantageous situation for commerce, has always made Smyrna be rebuilt; and she still continues to be a great city, while Ephesus, Miletus, and other celebrated emporiums on the same coast, have, from the filling up of their harbours, been long since reduced to total ruin. The Gulph of Smyrna, the entrance to which is between the island of Mytilene on the N., and Cape Carabourun on the S., is deep and angular, the distance following a ship's course from the entrance to the city, being about 11 nautical leagues. There is excellent anchorage in most parts of the Gulph, merely avoiding the shoals on its N. side. Ships of large burden usually anchor abreast of the city in from five to seven fathoms; but the water is so deep that they may lie close alongside the quays. The *fatat*, or sea-breeze, blows from morning till evening during the hot months, and is always waited for by ships going up to the city; and there being no obstructions in the way, the services of pilots are not required. In the night a land breeze generally blows from the city out to sea.

The principal articles of import consist of grain, furs, iron, butter, &c., from Odessa and Taganrog; and of cotton stuffs and twist, silk and woollen goods, coffee, sugar, cochineal and dye woods, iron, tin, and tin plates, rum, brandy, paper, cheese, glass, wine, &c., from Great Britain, France, Italy, the U. States, &c. Coffee is, perhaps, the most considerable article: it comes principally from America and England, and the annual consumption is estimated at 3,000,000 oke.

The exports consist principally of raw silk and cotton, the former produced about Brusa, and sent chiefly to England; fruits, particularly raisins, and figs; opium, which goes chiefly to America and Holland; rhubarb, and a variety of drugs and gums; olive oil, madder roots, Turkey carpets, vallonea, sponge, galls, wax, copper, hare-skins, from 350,000 to 400,000 annually; goats' wool, safflower, &c. Burgess, who visited Smyrna in July, 1834, says, "British commerce, if I may judge from the present state of the harbour, is by far the most considerable. There are now 30 vessels under cargo, of which more than a half are bound for Great Britain and Ireland. The English appear to engross the commerce of fruit; the French of cotton; the Dutch trade is entirely fallen off." (ii. 80—85.) The principal foundation of the commerce of Smyrna consists in the caravans, composed principally of Armenians, that arrive from Persia and the East, at fixed periods, which are nearly identical with those of the arrival and departure of most of the foreign ships frequenting the port. They carry to and convey away the greater portion of the exports and imports. Bargains are principally effected by Jew brokers, many of whom have amassed considerable fortunes. Upon an average, the selling charges, generally, may be calculated at about 12 per cent., and the charges on purchasing at about 8 per cent. The money, weights, and measures, are mostly the same as at Constantinople. Accounts are kept in piastres of 40 paras. The value of the piastre fluctuates according to the exchange; but, in 1834, Burgess received 97½ for 1*l.* sterling, and the Spanish dollar, at the same time, was worth 21½ piastres. The oke, which is the principal weight = 12 lbs. 13¼ oz. avoird.; the quintal = 127.48 lbs. avoird. (*Com. Dict.*)

Smyrna is well supplied with provisions of all kinds. Fish, including red mullet, oysters, &c., are very plentiful in the bay; and game of all kinds, mutton, the flesh of wild boars, &c., are good and abundant. Whey and clotted cream are used in great quantities. Sweet lemons, oranges, citrons, water-melons, figs, and grapes, are grown in great perfection in the environs, particularly at Menomen, and the other villages on the opposite side of the Gulph; whence boats carrying fruits and

other provisions, are continually passing to Smyrna. Mr. Burgess gives the ordinary prices of certain articles as follows:—Eggs 4 to 6 paras each; milk 30 do. per oke; a small loaf 6 or 8 do.; melons 20 paras the oke, grapes 30 do.; mutton 2 plast. 10 par. the oke; beef little more than half that price, &c.

Most travellers speak of the agreeable society met with in Smyrna; and the Greeks of the city have begun to adopt the manners and costumes of western Europe.

Historical Notice.—The accounts of the foundation and early history of Smyrna are obscure and somewhat contradictory. The most probable seems to be that it was founded by a colony from Ephesus. (*Strabo*, lib. xiv.) After undergoing various vicissitudes, it was destroyed by Alyattes, king of Lydia, the inhab. being dispersed among the surrounding villages. At the distance of about 400 years, a project for reconstructing the city would appear to have been entertained by Alexander the Great; but, if so, it was not carried into effect by that conqueror, but by Antigonus and Lysimachus. The city built by them was not, however, on the site of the old city, which stood on the flat shore on the other side of the Meles, about 2½ m. N.E. from the modern city. The admirable port and other advantages enjoyed by the newly built city rendered it in a short time one of the most populous, wealthy, and handsomest of the Asiatic cities. "It is," says Strabo, "the finest city of Asia. Part of it is built on a hill; but the finest edifices are on the plain not far from the sea, over against the temple of Cybele. The streets are the most beautiful that can be, straight, wide, and paved with freestone. It has many stately buildings, magnificent porticoes, majestic temples (including a *Homerium*, or temple in honour of Homer), a public library, and a convenient harbour, which may be shut at pleasure." (lib. xiv. *sub fin.*) Under the Romans Smyrna enjoyed the greatest consideration, and Marcus Aurelius rebuilt the city, after it had been almost destroyed by an earthquake. It was much frequented by the Sophists; and, along with Ephesus, became renowned as a school of oratory and science.

In more modern times it has undergone innumerable calamities, from which, as already stated, nothing but its admirable situation for commerce could have enabled it to recover. It was taken and given up to military execution by the famous Tamerlane, or Timur Bec, in 1402; and finally came into the possession of the Turks, in 1424.

Smyrna is one of the numerous cities that contended for the honour of being the birth-place of Homer; and Chios, perhaps, excepted, she would seem to have the best claim to this proud distinction. *Homeri Smyrniacum esse confirmant; ilaque etiam delubrum ejus in oppido dedicaverunt.*" (*Cicero pro Archia*, cap. 2.) From being born on the banks of the Meles, which washed the walls of the ancient as well as of the modern city, Homer is sometimes called *Melesigenes*.

"Blind Melesigenes thence Homer call'd,
Whose poem Phœbus challeng'd for his own."

Thence, also, Tibullus (lib. iv. eleg. i. v. 210.) calls his poems *Meleteas Chartas*; and Pausanias says (*Archæol.* cap. 5.), that a cave was pointed out at the source of the Meles, where they were said to have been composed.

Owing to the influence of earthquakes, and the still more destructive attacks of barbarians, Smyrna has but few considerable remains of antiquity. They consist principally of portions of the old walls, especially along the castle-hill, with some vestiges of the theatre and stadium. Many pedestals, statues, inscriptions, and medals, have been and are still discovered in digging; and perhaps no place has contributed more than this to enrich the collections and cabinets of Europe.

It has been supposed by Chandler and others, that the mud and other detritus brought down by the Kodus (an. *Hermes*), which has its embouchure on the N. side of the Gulph, will, in the end, fill up the channel; and by depriving the city of its port, effectually consummate its ruin. But though this effect may ultimately be brought about, it is abundantly certain, comparing the banks at the river's mouth with the space that has to be filled up, that a lengthened series of ages must previously elapse.

Besides the authorities already referred to, see *Ancient Universal History*, vii., 410., 8vo. ed., &c.

SNOWDON, a mountain of N. Wales, in Caernarvonshire, being at once the highest in the range of which it forms a part, and in S. Britain. The mountain, which is about 10 m. S.E. from Caernarvon, terminates in various peaks; the particular peak, the Wyddva (conspicuous), to which the name Snowdon is more particularly applicable, and which scarcely out-tops several of the surrounding summits, is 3,571 ft. above the level of the sea. The W. side of the mountain is very precipitous, and is composed partly of pentagonal basaltic columns. The view from the summit is very extensive. "I saw from it," says Pennant, "the co. of Chester, the high hills of Yorkshire, part of the N. of England, Scotland, and Ireland; a plain view of the Isle of Man; and that

SOCOTRA.

of Angkor by extended like a map before me, with every old castle" (*Tour en Arabie*, ii. 387 ed. 1818.)

SOCIETY ISLANDS. See PACIFIC.

SOCOTRA (an *Dessemdle* *Islands*), an island in the Indian Ocean, about 200 m. from the S. coast of Arabia, and 120 m. E. Cape Guardafui, in Africa; its chief town being in lat. $12^{\circ} 20' N.$, long. $40^{\circ} 5' E.$ It is of an elongated shape. Area estimated by Mr. Wallis at 1,500 sq. m. Pop. probably 4,000 or 5,000, principally Indians, with some called Arabs, African slaves, and descendants of Portuguese. The S. coast of Socotra possesses a curious and nearly unknown line, but on the N. it is indented with many bays and harbours. The interior may be described as consisting of mountains, nearly surrounded by a low plain of from 2 to 4 m. in width, extending from their base to the sea. The mountains are highest towards the N.E. part of the island, where their granite peaks rise to about 5,000 ft. elsewhere they average nearly 3,000 ft. in height, and consist mostly of a compact cream-coloured primitive limestone. The island is not well watered, but the E. is, in this respect, better than the W. portion. The climate does not appear to be particularly unwholesome, though it is more insipid than in the adjacent continent. Among the few natural products, the most important is aloë (*Alf* *spicata*, or *Acrotropis*) for which the island has been famous from the earliest period. This plant is found growing spontaneously and in great abundance on the sides and summits of the limestone mountains, at an elevation of from 300 to 3,000 ft. above the level of the plains. Its leaves are plucked at any period, and after being placed in a cloth, the juice is suffered to exude from them. In this state they are mostly shipped for Bombay. Formerly the parts of the island producing the aloë were turned out to different individuals, the produce being taken at a low fixed price by the Sultan. At present, any one collects the aloë leaves who chooses to take the trouble, and nothing is levied on the Sultan's account. The quantity exported of late has varied very much. In

SOLOTHURN.

659

stone bridge, 17 m. S.W. Lucern. Pop. in 1848, 7,900. Its fortifications consist merely of bastioned ramparts. It is well built, and clean, the houses being mostly of stone, rooled with slate. There are many curious and venerable public buildings, viz. the cathedral, founded in the 15th century with an altar piece by Raham, representing the "Adoration of the Shepherds," the remains of an abbey founded in the 11th century, the motif, on the site of that which was the residence of various Habsburg kings, &c. The college, hospital, house of correction, public library with 10,000 vols., and theatre deserve notice, and in the vicinity are the ruins of St. Madard's Abbey, founded in 607 in which Pope, Carlsbad, &c. were crowned, and Louis le Débonnaire was crowned by his sons. Solothurn is a bishop's see, and has a court of primary jurisdiction, a communal college, two seminaries, a society of arts and sciences, manufactures of coarse woollens, hosiery, and earthenware, and a considerable trade in agricultural produce.

Solothurn has been the theatre of various historical events. It was here, in 495, that Clovis finally extinguished the last remains of the Western Empire, by his victory over the Roman general Syagrus. The town then became the cap. of the Franks, and afterwards of a bishop, of its own name in the 6th and 7th centuries. It was frequently besieged and taken in the middle ages, and was the scene of some severe fighting between the French and the allies in 1814. (*Magaz. art. Suisse*, *Décl. d'Aug. &c.*)

SOLOTHURN (French *Solure*), a capital of Switzerland, in the N.W. part of the Confederation, between lat. 47° and $47^{\circ} 30'$, and the 7th and 8th days of E. long.; having N. Rode, N. and S.E. Aargau and Lucerne, and on the other side the canton of Berne. Area 100 sq. m. Pop., in 1850, 20,074, mostly all S. Catholics. Though of a very irregular shape, it may be divided into two nearly equal portions, the N.W. covered with ranges of the Jura Mountains, and the S.E. comprised in the valleys of the Aar and Emme. Some of the summits in the former rise to about 4,000 ft. above the level of the sea; but though rugged, this part of the mountain has a large extent of fine open pastures. In the other, or lower portion of the canton, the ground is fertile and well cultivated; so that, on the whole, Solothurn is regarded as one of the most productive portions of Switzerland. More care is given than is required for the consumption of the people; the vine does not succeed, but a good deal of fruit is notwithstanding grown for exportation. The raising of live stock is here, however, as in most other Swiss cantons, the chief branch of rural industry. In 1850, it was estimated to have about 20,000 horned cattle, 14,000 sheep, and 14,000 hogs: the latter are fed in the woods, which are tolerably extensive. The cattle are estimated among the best in Switzerland; they are of a peculiar large-bellied breed, and with horns, cheese, cherry brandy, fire-wood, and marble, constitute the principal articles of export. Only a few hands are employed in mining; and the manufacturing establishments are mostly confined to a few iron works, smelting and cotton looms, paper mills, tanneries, and printing houses. The currency, weights, and many stages of civilisation, are similar to those of Europe.

Under the Constitution, as modified in 1831, the greater council consists of 150 members, 94 of whom are chosen by the towns and the 10 rural districts into which Solothurn is divided, and the remaining 56 by the members, already elected. The lower or executive council, composed of 17 members, is chosen with its president, or mayor, from among the greater council. The assembly meets twice a year for 15 days, during which period each member receives 1 fr. a day. The towns of Solothurn and each of the districts has a court of primary jurisdiction for civil causes; but all criminal cases, as well as the final jurisdiction in civil suits, belong to a central tribunal of 14 members, presided over by the mayor of the same assembly. Every male inhabitant above the age of 16 is liable to military service: the contingent to the army of the confederacy is 600 men. Total public revenue in 1850, 625,104 fr.; expenditures, 400,000 fr., of which 15,000 fr. was contributed to the general Swiss treasury. There is no town worthy of notice, except the emp., Olten, Dornach, &c. being mere villages.

SOLOTHURN, or **SOLURE** (an *Solothurn*), a town of Switzerland, and the cap. of the above canton, on the Aar, near the foot of the Jura Mountains, and 10 m. N. by E. Bern. Pop. in 1848, 4,807. The river divides it into two unequal parts, which communicate by two wooden bridges. It was surrounded, in the 17th century, by numerous fortifications, the removal of a part of which was ordered by the national council in 1805. It is tolerably well built, and has several conspicuous public edifices; including, among others, the cathedral of St. Yves, one of the best churches in Switzerland, with several other churches and convents, a town hall, a square clock-tower in the market place, the arsenal, with an extensive and curious collection of armour, a museum, government house, with some good sculptures

to the Sultan barely amounts to 500 dollars a year. The population is wholly Mohammedan. The women go unveiled, and are partly occupied in tending flocks, and partly in making glass, and carding, spinning, and weaving wool.

The only town of any consequence in Timor, on the N.E. shore, in the centre of a bay which affords tolerable anchorage. Having been ruined by the Wahabees, in 1801 it consists of only about 150 straggling and dilapidated houses, not more than one third of which were inhabited in 1804. The town had then but two shops, where the only articles exposed for sale were dates, grain, tobacco, and cloths. (*Wallis in Eng. Journal*, 9. 120. 70.)

SOHAM, a market-town and par. of England, in Cambridgeshire, near the borders of Suffolk, 6 m. S.E. Ely. Area of par., 12,430 acres. Pop., in 1841, 4,145. The town, which is irregularly built, covers a good deal of ground. The par. church is of various dates, one portion being late Norman. The living, a rectory, worth 600l. a year is in the patronage of the present incumbent, who also holds the rectory of Soham-Rail, worth 510l. a year (*Recd. Rev. Rep.* 1851). Soham has numerous charities, especially Bishop Laney's, for apprenticing children of the par., with an annual revenue of near 600l.; a large charity school, and several almshouses. The fen or more, which once covered the adjacent country has been drained and cultivated, and supplies most part of the dairy produce, for which Soham is celebrated. Market days, Saturday. Fair, May 7., for horses and cattle (*Par. Rep.*)

SOHNSON (an *Modestum*, post. *Augusta Modestum*), a fortified town of Prussia, dep. Altm., dep. arond.; on the Rhine, here crossed by a handsome

hospital, house of correction, barracks, theatre, &c. It has, also, a gymnasium, a botanic garden, and a public library, said by Ebel to comprise 10,000 vols. On the whole, however, the town is dull, having few manufactures, and but little trade. The Polish patriot and general, Kosciuszko, resided here during the last two years of his life, which terminated on the 16th of Oct., 1817. His remains were carried to the cathedral of Cracow, where they repose beside those of the famous John Sobieski. (*Strohmeier, Der Kanton Solothurn; Picot, Statist. de la Suisse; Ebel.*)

SOMERSET, a maritime co. of England; having N. and N.W. the Bristol Channel, the Severn, and Gloucestershire, E. Wiltshire, S. Dorset and Devon, and W. the latter. Area, 1,052,800 acres, of which about 900,000 are supposed to be arable, meadow, and pasture. With, perhaps, the single exception of Yorkshire, there is no county in England that has a greater variety of surface and soil than Somerset. In some places, particularly in its W. and N.E. divisions, it is hilly, and even mountainous; in its middle part, between the rivers Ax and Parry, there are very extensive tracts of marsh land, which, in some places, are of extraordinary fertility: in other places again, there are extensive moors, of which Exmoor, at the W. extremity of the co., is the principal. But, exclusive of these, the co. contains a large extent of land equally adapted for tillage and pasturage. The Vale of Taunton is one of the richest and most beautiful tracts in the kingdom. Tillage husbandry is neither extensively carried on, nor in the most approved manner. The land is not injured by overcropping, but it is not properly wrought, and is frequently foul, and out of order. Principal crops, wheat, oats, barley, and beans. In the southern and interior parts, the rotation is, 1. fallow, 2. wheat, 3. beans or seeds, 4. oats; in the E. part of the co. it is generally, 1. fallow, 2. wheat, 3. oats or barley, 4. seeds. Potatoes are pretty extensively grown; but turnips are not cultivated to any extent in any part of the co. Lime is frequently used on the arable land: and, with the exception of dung, is the only manure that is employed. Drilling but little practised; beans mostly planted by the dibble. Labourers said to be indolent; and that they seem, when employed, as if they would rather stand still than exert themselves. (*Kennedy and Grainger, l. 308.*) A large proportion of the co. is in grass, the dairy and fattening systems being both extensively carried on. Cattle, principally of the Devonshire breed; but a great variety of other breeds are met with. The celebrated Cheddar cheese is so called from a village of that name on the W. side of the Mendip Hills; but it is now principally made in the marshes round Glastonbury. Bridgewater cheese is made from the marshes between that town and Cross. The stock of sheep in the co. is supposed to amount to about 500,000 head, partly long, and partly short-woolled; producing, in all, about 10,500 packs a year. Large quantities of excellent cider are made in various parts, but particularly in the vale of Taunton. The woods and woodlands are supposed in all to cover from 20,000 to 25,000 acres; and it is distinguished by the stately growth of its hedgerow timber. Property very variously divided; some large estates, but a good deal of land occupied by yeomen who farm their own estates. Farms of various sizes, but the majority small. Leases, when granted, are usually for 8 or 12 years: in many instances, however, farmers hold at will. Average rent of land, 25s. 9d. an acre, being, with the exception of Leicester and Middlesex, the highest in the kingdom. Mineral products numerous and valuable, consisting principally of coal, lead, calamine, fuller's earth, limestone, freestone, &c. Owing, however, to the lead mines having been nearly exhausted, or becoming more difficult to work, the produce of lead is now quite inconsiderable. The woollen manufacture used to be extensively carried on at Taunton; but it has given place to the silk trade, introduced in 1778, and at present prosecuted on a pretty large scale. The woollen manufacture is still, however, carried on at Frome, Shepton Mallet, Wellington, and some other places in the co.; but it has long been in a declining state. Gloves largely manufactured at Yeovil. Principal rivers, Lower Avon, Ax, Brue, Parret, and Exe. The Parret is navigable from Longport to its mouth. Taunton and Bridgewater are united by a canal; and there are canals in other parts of the co. Somersetshire is divided into 40 hundreds and 7 liberties, and contains 475 parishes. It returns 13 mems. to the H. of C.: viz. 4 for the co., 2 each for the cities of Bath and Wells, 2 each for the bor. of Bridgewater and Taunton, and 1 for Frome. Reg. electors for the co., in 1849-50, 18,106, of which 9,875 belonged to the E., and 8,231 to the W. division. In 1841, Somerset had 82,617 inhab. houses, 435,982 inhabs., of whom 209,383 were males, and 226,599 females. Sum expended for the relief of the poor, in 1848-49, 183,779*l.* Annual value of real property, in 1815, 2,308,723*l.*; do., in 1843, 2,991,746*l.*

SOMERTON, a market-town and par. of England,

co. Somerset, on rising ground beside the Carey, 11 m. S.S.W. Wells. Area of par., 6,080 acres. Pop., in 1841, 1,981. The town consists of some small streets, with houses mostly of blue lias stone; and has a town-hall, in which petty sessions are held, and one of the co. gaols. The church, an ancient structure, has an eight-sided embattled tower, 68 ft. in height. The living, a vicarage, worth 269*l.* a year, is in the gift of the Earl of Ilchester. Somerton has a good free-school, and an almshouse for 8 poor women. Though supposed to have been a Roman station, there is no information respecting it till the Hoptarchy, when it was a considerable fortified town, and the residence of Ina and other kings of Wessex. Hence it abounds in Saxon antiquities, including parts of the ancient walls, a round tower, and the castle, in which John king of France was imprisoned subsequently to his capture at the battle of Poitiers.

SOMME, a dép. of France, reg. N., comprised mostly in the old prov. of Picardy, between lat. 49° 37' and 50° 20' N., and long. 1° 25' and 3° 10' E.; having N. Pas-de-Calais, E. Aisne, S. Oise, and W. Seine-Inférieure and the English Channel. Area, 614,287 hectares. Pop., in 1846, 570,529. Its general slope is towards the N.W., which direction is taken by its principal rivers, consisting of the Somme, which divides it into two nearly equal parts, the Authie, forming a part of the N. boundary, and the Bresle, bounding it on the S.W. The Somme rises at Fonsomme in Aisne, and runs generally N.W. to the English Channel, which it enters a little below St. Valery, nearly opposite Hastings, by an estuary from 3 to 4 m. wide, after a course of about 120 m. Its principal affluents are the Avre and Celle; St. Quentin, Ham, Peronne, Amiens, and Abbeville are on its banks. The Somme is navigable for about half its course, but its navigation is interrupted by shoals. The lateral canal of the Somme (*Canal de Picardie*), 96 m. in length, commences at Abbeville, and connects this river with the Oise. This dep. has generally a naked aspect. In 1834, according to the *Official Tables*, it comprised 475,363 hect. arable land, 15,432 do. meadows, 20,550 do. orchards, &c., and 51,207 do. woods. Agriculture is more advanced than in most French depts.; *le cultivateur est laborieux et dégagé de préjugés.* (Hugo.) More corn is grown than is required for home consumption; in 1835, its produce was estimated at nearly 5,758,000 hectol., principally wheat, maslin, and oats. About 200,000 hectol. of cider, and 100,000 do. of beer, are produced annually. Cattle and sheep are numerous, and the produce in wool is stated to be about 780,000 kilog. a year. In 1835, of 248,927 properties subject to the *contrib. foncière*, 123,745 were assessed at less than 5 fr. Mineral products are of little importance; but the dep. is distinguished for its manufactures. Woollen, cotton, and silken goods of various kinds, are made at Amiens and Abbeville; cotton and linen thread, oil, and leather at Peronne, Ham, Doullens, &c. Escarbotin is the seat of some of the largest hardware factories in the kingdom; and machinery, paper, and beet-root sugar, are produced in considerable quantities. Somme is divided into five arronds: chief towns, Amiens the cap., Abbeville, Doullens, Montdidier and Peronne. It sends 7 mems. to the Ch. of Deps. Registered electors, 1838-39, 2,971. Total public revenue, 1831, 16,184,848 fr. (*Hugo, art. Somme; French Official Tables.*)

SOOLOO ISLANDS, a group of the E. Archipelago, 4th division (*Crawford*), extending from the N.E. part of Borneo to Mindanao, the most S. of the Philippine islands, between the 4th and 7th degs. of N. lat., and the 120th and 123d of E. long.; having S. the Sea of Celebes, and N. the Sooloo Sea. They consist of about 60 islands, taking their name from Sooloo, one of the largest, about the middle of the group. They produce rice, sweet potatoes, yams, and many of the finest fruits of the East; but sago is the principal food of the inhabs. Pearls, mother-of-pearl, and cowries, are among their most valuable products. Formerly the inhabs. carried on a large trade with Japan; at present their commerce is chiefly with the adjacent islands of Celebes, Mindanao, Borneo, &c., and a few junks that come yearly from China. The Sooloos are mostly Mohammedans, and live under a sultan, whose power is, however, much limited by a kind of feudal aristocracy. They are distinguished for their piracies, and their continual hostility to the Spaniards of the Philippines; in 1775 they destroyed an establishment formed by the E. I. Comp. on the neighbouring island of Balambagan. (*Hamilton, E. I. Gaz.*)

SOPHIA, or TRIADITZA, a city of European Turkey, prov. Bulgaria, near its W. extremity, in a fine plain, on the Bogana, a tributary of the Isker, 93 m. S.S.E. Wludin, and 155 m. S.W. Rustchuk. Horschelmann (*Stein*), the *Dict. Géog.*, &c., agree in rating its pop. as high as from 45,000 to 50,000; and it is said to have 30 mosques, and 10 churches. Mr. Burgess says, "Sophia, although one of the meanest cities I ever saw, must still be considered as the cap. of Bulgaria, and as holding a high rank among the cities of European Turkey. The situation appeared to me the most unfavourable that

could have been chosen for a city; sunk in a hollow, it is constantly liable to be inundated; and without canals to carry off the superabundant waters of the Isker, the plain is almost lost to the labour of the agriculturist. The habitations are all made of baked mud; and I scarcely saw one which ought to be qualified with any other appellation than that of hovel." (*Greece, &c.*, ii. 269.) Sophia is, however, the residence of the begler-beg of Roumelia, and of Greek and Rom. Cath. archbishops. It has manufactures of woollen and silk stuffs, leather, and tobacco, and an extensive general trade. There are some warm baths. This city, founded by Justinian, was built, it is said, on the ruins of the anc. Sardica. (*Burgess's Greece, and the Levant*, ii.; *Dict. Géog.*, &c.)

SORA, a city of the Neapolitan dom., Terra di Lavoro, cap. distr., on the Liris, 50 m. N. N. W. Capua. Pop. 10,000. (*Rampoldi*.) "The episcopal town of Sora, retaining its ancient name and situation, is about 3 m. distant from Isola, along an excellent road, which terminates with the valley itself at its gates. Here the Liris, flowing from a glen of narrower dimensions, but considerable length, forms a bend round the city, and is crossed by two bridges. The place is consequently in a flat but not unpleasant position; one whole flank being watered by the river, and the hinder extremity resting against an insulated rocky hill, on which are seen the ruins of its Gothic castle, and those of its still more ancient walls. The dwellings are large, the streets wide and well paved, and the pop. apparently easy and industrious." (*Craven's Excursion in the Abruzzi*, &c. i. 112.)

After its cathedral, in the front of which are a number of inscriptions and fragments of sculptures, the principal buildings are four other churches, several convents, hospitals, and seminaries, a showy modern gateway, &c. The adjacent country is both fertile and well cultivated.

Sora was of Volscian origin, but became, at an early period, attached to the party of the Samnites; though subdued and colonised by the Romans, it repeatedly threw off their yoke, and vindicated its ancient freedom. Juvenal enumerates Sora among the country towns in which an individual, tired of the bustle and dissipation of Rome, might find a comfortable residence:—

*Si potes avelli Circensibus, optima Sora
Aut Fabrateris domus, aut Frusnone paratur.*
Sat. iii. 223.

Sora was the birth-place of the Cardinal Baronius.

SORIA (an. *Numantia*), a city of Spain, in Old Castile, cap. prov. of its own name, on, and at no great distance from, the source of the Douro, here crossed by a fine stone bridge, 113 m. N. E. Madrid. Pop. about 5,500. It is enclosed by old walls, and has numerous churches and convents, an hospital, Jesuits' college, prison, &c. On the E. it is commanded by an old fortress, now partly in ruins; and on the S. is a considerable suburb. It is dirty and ill-built, with a few silk fabrics, and some trade in wool.

Adjacent to the town, on the N., are the ruins of the famous city of NUMANTIA, destroyed by the Romans, anno 132 B. C. No people ever discovered greater bravery, or made a more gallant stand in defence of their liberties, than the inhabs. of this small state. *Numantia, quantum Carthaginis, Capuæ, Corinthi, opibus inferior, ita virtutis nomine et honore par omnibus, summumque, si viros æstimes, Hispaniæ decus.* (*Florus*, lib. ii. cap. 18.) The conduct of the Romans in this contest was distinguished alike by perfidy and vindictive malignity. The Numantines having defeated Pompey, grandfather of Pompey the Great, who had besieged their city, he concluded a treaty with them. But the Romans having, on various pretexts, broken this treaty, sent a powerful army against the Numantines under the consul Mancinus. The latter, however, being even more unsuccessful than Pompey, was obliged, to save himself and his army from total destruction, to conclude a new treaty with his successful adversaries; who stipulated for nothing but that they should retain their independence, and be reckoned among the friends and allies of Rome.

Tiberius Gracchus, then quaestor in the consular army, was a principal party to this treaty, the observance of which was sworn to by all the chief officers of the Roman army. But though the Numantines spared by this treaty the lives of 10,000 Roman soldiers that were in their power, and stipulated for nothing that a generous or high-minded people could, under any circumstances, have refused to concede, the senate and people of Rome were base enough to annul the treaty; and sent Scipio Africanus, who had destroyed Carthage, to wage a war of extermination against the Numantines! Scipio, who knew the bravery of those he had to contend with, did not attempt to carry the city by storm; but having surrounded it by strong lines of circumvallation, left famine to effect its reduction. Notwithstanding their inferior numbers, the Numantines made the most astonishing efforts to break through and destroy the works of

the Romans; but having been repulsed, they were reduced to the most dreadful extremities. It is uncertain how the final catastrophe of this noble city was consummated; whether, as Florus affirms (lib. ii. cap. 18.), the Numantines set it on fire, and perished in the flames; or whether, as Appian states (*In Iber.* p. 311.), having surrendered, the small remnant of its inhabs. that were found alive were sold as slaves. One thing only is certain, that the struggle reflects the highest credit upon the Numantines, and the most indelible disgrace on the Romans. It is due to the character of Tiberius Gracchus to state, that he reprobated in the strongest manner the perfidy and bad faith of his countrymen in refusing to ratify the treaty with the Numantines. (Besides the authorities already referred to, see *Ancient Universal History*, xii. 400., 8vo. ed.)

SORRENTO (an. *Surrentum*), a city and sea-port of the Neapolitan dom., prov. Naples, on the S. side of the Bay of Naples, 18 m. S. E. that capital. Pop. about 8,000. (*Rampoldi*.) It is well built and clean; and has been celebrated in antiquity, as well as in modern times, for the beauty of its situation, and the mildness of its climate, being hence called by Horace *Surrentum Amaram*. (*Epist.* ii. 18. lin. 52.) It is the seat of an archbishopric; and besides the cathedral, has several churches, numerous convents, an hospital, seminary, college, school of navigation, and some silk manufactures. It was supposed in antiquity to have been the seat of the Sirens. (*Plin.* lib. iv. cap. 5.) But it derives its principal illustration from its having been the birth-place of Torquato Tasso, the greatest of Italian, and, perhaps, of modern poets, born here on the 11th of March, 1544. "Among the many respectable houses termed palaces, which adorn Sorrento, that in which the author of the *Gerusalemme Liberata* was born, naturally excites the greatest interest; it is placed on the cliff rising immediately from the sea, and offers some pretensions to elegance of architecture, but probably retains in its outward form no remains of its ancient appearance. Sorrento is a place of high antiquity; and the various inscriptions, bas-reliefs, &c., found in it at different periods, are collected under an archway in the town, which thus forms a kind of open museum, accessible to every visiter. The ancient walls and towers can scarcely be referred to the Lombards, who erected this territory into a small indep. principality. Oil, milk, meat, and game, are all excellent in their different kinds at Sorrento; while its veal is, by some, reputed the best in Europe. The capital is supplied from it with many of these articles, by boats plying at regular times of the day." (*Craven*, 394—396.) The beautiful Bay of Sorrento, 3 m. wide, is surrounded by a semi-circular range of wooded hills, between which and the sea is a rich plain, the *Piano di Sorrento*, in which are many villages and detached houses.

It was on the hills bounding the plain *Colles Surrentini vitiferi*, that the famous wine was produced, which, in antiquity, vied with the Falernian and Cæcuban.

*Surrentina bibes? nec Murrhina picta, nec aurum
Sume: dabunt calices hæc tibi vina suos.*
Mert. Epig., lib. xiii. 110.

It was a powerful wine, and did not arrive at perfection till it had been kept above 20 years. Owing to the want of care, the wine now produced from Surrentine grapes is among the poorest in Italy. Near Sorrento are the remains of the villa of Pollius, described by Statius. (See *Swinburne's Travels*, I. 88.)

SOUND. See *ELSINEUR*.

SOURABAYA, a considerable town of Java, being one of the three principal sea-ports of that island, on the N. coast of which it is situated, about 160 m. E. Samarang. It stands about 1½ m. from the Strait of Madura, on both sides a river, said to be navigable by boats for 100 m. from the sea, and deep enough at its mouth to receive vessels of 250 tons. The town itself is of small extent, but it has several suburbs, and round it are a number of handsome villas; its vicinity, though low, being less unhealthy than that of Batavia. Mr. Earl says that it is also much more gay and lively than the latter, and well supplied with provisions of all kinds. Sourabaya seems to have the only secure harbour on the N. coast of Java, and the only one in which the shipping is well defended by the batteries on shore. Its chief entrance is commanded by a strong fort on a low island about 9 m. from the town. Several English residents, agents to houses at Batavia, are settled here; though Europeans are upon the whole few. There are numerous Arabs and their descendants. According to Earl, more ships are built at Sourabaya than at any other port of the E. Archipelago: when he visited the place, in 1836, the great ship-builder was an Englishman, employing from 300 to 400 workmen, all of whom lived in a large village adjoining his dockyard. (*Earl's Eastern Seas*, 47. 73.; *Hamilton*, &c.)

SOUTHAMPTON, a parl. and mun. bor., sea-port, and market-town of England, being a co. of itself in Hampshire, at the embouchure of the the Itchen, in an

inlet of the sea, called Southampton-water, 12 m. S. by E. Winchester, and 70 m. W.S.W. London. Lat. $50^{\circ} 53' 59''$ N., long. $1^{\circ} 24'$ W. Pop. of the par. bor., which is co-extensive with the co. of the town, in 1831, 19,324; in 1841, 27,490. The approach to the town from the London road, through a fine avenue of trees and a well-built suburb, is exceedingly striking. The principal entrance is through Bargate, one of the ancient gates, which also divides the town into 2 parts, called respectively Above-bar and Below-bar. The High-street below bar, which is more than $\frac{1}{4}$ m. in length, leads directly to the quay, for the improvement of which the water-gate was removed about 40 years ago. The ancient part of the town was formerly enclosed with walls about $\frac{1}{4}$ m. in circ., of which there are considerable remains on the W. side of the town, and two old gates in addition to Bargate. Many smaller streets branch both E. and W. from the principal avenue, and buildings are rapidly increasing, the space occupied by streets and houses now exceeding $\frac{3}{4}$ m. in circuit. "The old town occupies nearly the whole of the pars. of St. John, St. Lawrence, Holyrood, St. Michael, and All-Saints-intra. The pars. of St. Mary and All-Saints-extra are extensive, and were till of late years principally agricultural. The town, however, now extends into both of them; and in the latter the new buildings consist principally either of handsome town-houses or detached villa residences. A new road has been formed, extending E. from the High-street to the steam-ferry over the Itchen; several new streets are already in progress, and docks have been [formed] on the river, near the ferry-pier. The pars. of St. Lawrence and Holyrood, through which the High-street passes, contain the dwellings of the most respectable and opulent tradespeople: in the latter are the Market-place, Audit-house, Custom-house, several of the principal hotels, and the town quay; indeed in a commercial point of view, these two pars. comprise the most important part of the town." (*Mun. Bound. Report.*) The whole town is well paved, lighted with gas, and is exceedingly clean: the inhabs. were till lately supplied with water from several springs in the neighbourhood, but from the increase of pop., and the deficiency of water of late years, the commissioners of water-works entered into a contract for the construction of an Artesian well on Southampton Common, to supply 40,000 cubic feet per day. The old reservoirs on the common are supplied from this well in dry seasons. Besides the buildings devoted to commerce and other purposes, the town has a theatre and assembly-rooms. The military orphan asylum for girls, established by the late Duke of York, and occupying the disused barracks, has been removed, and the buildings are now appropriated to the establishment for the trigonometrical survey, removed thither from the Tower of London. The handsome suite of baths on the beach have been converted into a dock house and offices for the Southampton Dock Company; but there are very convenient baths in other parts of the town. The old Saxon castle, repaired by Richard II. in the view of protecting the harbour, was pulled down some years ago, and a private chapel, in which the Church of England service is performed, built upon its site.

The town has five par. churches, three of which are in the gift of the lord chancellor, one in that of the bishop of Winchester, and another in the patronage of Queen's College, Oxford. Holyrood church is an ancient edifice, with a tower and spire, the portico being the site, before the Reform Act, for the hustings at elections for the bor. St. Michael's is a large structure in the Norman style, with a handsome tower and spire between the nave and chancel. All-Saints is a Grecian building, with a turret, surrounded by six Corinthian pillars on a square pedestal. St. Mary's, also, is a modern structure, and its extensive burial-ground long served as a general cemetery for the town; but within the last few years, a cemetery of 20 acres has been formed on Southampton Common. The Rom. Caths., Independents, Baptists, Wesleyan-Methodists, and Jews have each places of worship; and there is a Friends' meeting-house. There are 2 chapels, 1 proprietary, and 1 under trustees in connexion with the establishment, and well-attended Sunday-schools, with several day-schools, supported wholly or in part by endowment. The grammar-school, founded by Edw. VI., has a small endowment: the premises have been rebuilt, and furnish accommodation for about 40 boys, boarding with the head master. An hospital, called the *Domus Dei*, founded in the reign of Henry III., provides lodging, clothing, and a weekly stipend to four aged people of each sex. Among other valuable charities is one left, in 1760, by the will of Alderman Taunton, which, besides providing for the instruction of 10 boys, furnishes a stipend of 10*l.* a year for 16 aged persons, and gives rewards to deserving female servants. It has also a female penitentiary, public dispensary, and lying-in charity, a royal humane society, several benefit societies, and a school of industry for 50 girls, founded, in 1828, through the influence of Queen Adelaide. There are several religious societies, a literary

society, a polytechnic institution, with 400 members, an infirmary, and several news-rooms and subscription-libraries. A regatta takes place every summer on Southampton-water, under the direction and patronage of the Southampton Yacht Club, and races are held in autumn on the common N.W. the town. Two newspapers, also, are published every Saturday.

Southampton-water affords good anchorage; and ships of 250 tons may load and unload alongside the town quay, close to which is the custom-house. A new pier of wood and stone, which projects about 400 yards from the shore, forms a convenient landing-place for passengers from steamers, &c., as well as a promenade for the inhabs. and visitors. It has a carriage-drive to its extremity. Docks, on an extensive scale, have, as already stated, been constructed, which contribute materially to the commercial facilities now enjoyed by the port.

Southampton is now become a leading packet station. The Peninsular and Oriental Steam Navigation Company run the whole of their vessels from this port to Alexandria and Lisbon; and the Royal West India Mail-packet Company start their steam ships from this port also, and have a graving dock on the banks of the Itchen for constructing and repairing ships, &c.

From its position on an inlet of the sea, stretching N.W. from between Portsmouth and the Isle of Wight, at least 17 m. into the country, and which has been prolonged by means of the Itchen to Winchester, 12 m. inland, Southampton is the emporium of an extensive district, and consequently enjoys a pretty extensive trade. In 1850, there belonged to the port 210 sailing vessels, of the aggregate burden of 13,498 tons, exc. 25 steamers, some of which are large and handsomely fitted up: the gross customs' duties amounted, in 1849, to 61,016*l.* It may be farther mentioned, as illustrative of the increasing importance of the port, that, in 1830, 369 ships, of the aggregate burden of 37,056 tons, entered inwards; whereas, in 1845, no fewer than 727 ships, of the aggregate burden of 150,826 tons, entered inwards. The real or declared value of the exports from Southampton rose, during the same period, from 135,372*l.* to 1,475,105*l.* being an almost unparalleled increase.

Owing to her position with respect to the opposite coast of France, Southampton has been for a lengthened period an important station for travellers to and from the Continent. In this respect her importance has vastly increased since the opening of the South-Western Railway, by which the town has been brought within a three hours' journey of the metropolis. This great undertaking, in which a very large sum has been expended, has gone far to make Southampton an outpost, as it were, of London. In fact, she is now become the principal station of the steamers for Havre, Dieppe, and other French ports, as well as of those for Lisbon, the Mediterranean, &c. By setting off from Southampton, the difficult navigation from the N. Foreland round by Dover and Beachy Head is avoided; and ships are enabled to proceed on their voyages with comparatively little chance of being delayed by adverse winds. Vast numbers of tourists are also brought down by the railway, attracted by the mildness of the climate, and the beauty of the scenery of the New Forest, the Isle of Wight (to which there are steamers every hour), &c. The formation of the railway from Havre by Rouen to Paris has conferred still greater importance on Southampton.

Southampton has various private banking establishments, two joint-stock banks, and a savings' bank. Markets, Tuesday, Thursday, and Saturday, for provisions, and on Friday for corn, well attended. Fairs, May 6. and 7., and on Trinity Monday and Tuesday.

Southampton was first incorporated in the reign of Henry I. Under the Mun. Reform Act it is divided into 5 wards, with 10 aldermen and 30 councillors, from which 40 members are chosen the mayor, sheriff, and 2 bailiffs. The mayor and bailiffs are the returning officers of the borough. Corp. revenues, in 1848-49, 8,862*l.* Quarter and petty sessions are held under a recorder; there is a court for the recovery of debts to any amount; and a county court is established here, before which 1,638 plaints were entered in 1848. The bor. has returned 2 mems. to the H. of C. since the 23 Edw. I., the right of election down to the Reform Act being vested in the inhabs. paying scot and lot. The electoral limits were left unchanged by the Boundary Act. Reg. electors, in 1849-50, 2,297. It is also the election town for the S. div. of the co. Hants.

Southampton is said to have arisen out of the neighbouring Roman station *Clausentum*, E. the Itchen, which was succeeded by the Saxon *Hantane*, on the site of the present town. The castle, as already stated, was much enlarged by Richard II., who also strengthened the fortifications about the town and harbour. Henry V. set sail from this port, in August, 1415, at the head of the troops which, on the 25th of October following, gained the great victory of Agincourt. The inhabs. were actively engaged in the wars of York and Lancaster, in which

SOUTH MOLTON.

the latter party was defeated with great loss. Its celebrity as a watering-place dates from the middle of last century, when baths were erected, a chalybeate spring was discovered, and great additions were made by the formation of new streets and terraces, the laying-out of public gardens, &c. The shores of Southampton-water, being richly clothed with wood and studded with villas, afford a succession of finely diversified scenery, set off by the ruins of Netley Abbey, about 2 m. S. E. from the town. This structure was founded in 1229, by Henry III., for Cistercian monks. The refectory and kitchen are in tolerable preservation; and there are some fine remains of the Abbey church, which was cruciform, and had at its E. end a noble window. The whole is embosomed in wood; and near it is a modern tower, used as a tea-house, on the foundations of a fort erected by Henry VIII., commanding a fine view of Southampton-water. (*Mus. and Parl. Bound. Reports, and Private Information.*)

SOUTH MOLTON (or **MOULTON**), a munic. bor., market town, and par. of England, N.E. part co. Devon, hund. S. Molton, on an eminence near the confines of Exmoor, 12 m. E. by S. Barnstaple. Area of par., 6,160 acres. Pop. in 1831, upwards of 4,000. The limits of the munic. bor. and par. are co-extensive. The town consists chiefly of three streets, diverging from a spacious market-place. Many of the houses are good; streets well paved; the footpaths have been flagged, at a considerable expense, by the corporation. It is well lighted, and the public walks are kept remarkably clean. (*Mus. Corp. Rep. Appendix.*) The par. church has some good monuments, and a large organ. The living, a perpetual curacy, worth 157l. a year, is in the gift of the dean and canons of Windsor. Here are free and charity schools; a guildhall, in which petty sessions are held every three weeks; and a gaol, rebuilt a few years since. The pop. is partly manufacturing, and partly agricultural: the manufactures are chiefly of coarse woollen cloth, but that of lace has been recently introduced, and the trade of the town is said to be increasing. This bor. sent mems. to the H. of C. in the 30th of Edw. I.: but it does not appear to have subsequently exercised the privilege. It was chartered by Elizabeth and Charles II.; and is governed by a mayor, 3 other aldermen, and 12 councillors, the latter being elected for life among the resident inhabs. The corporation, which is trustee for several charities, has an income of 2,855l. a year, out of which the mayor receives an annual income of 50l. About 3 m. N.E. from the town is Castle Hill, the seat of Earl Fortescue. (*Mus. Corp. Rep. and Appendix.*)

SOUTHWARK. See LONDON.

SOUTHWELL, a market-town and par. of England, co. Nottingham, Southwell and Scrooby liberty, on an eminence near the Greet, 13 m. N.E. Nottingham. Area of par., 4,550 acres. Pop., in 1831, 3,385. The town is neat, well built, and well paved. It has a convenient suite of assembly-rooms, a theatre, &c.; but its principal building is the minster, or parish church. This, which is a large and magnificent edifice, is said to be, in part at least, as old as the time of Harold. Its extreme length is 306 ft., its breadth 59 ft., and the length of the transept 121 ft. The W. front has 2 lofty square towers, divided into 7 stories. There is a low massive centre tower, and a chapter-house on the N. side. The nave and transepts are Norman, the parts E. of the centre early English, and the chapter-house early decorated. There are some perpendicular insertions, particularly a very large W. window. Within the church are the monuments of 5 archbishops of York. The chapter-house, which is light and graceful, has 16 prebends' stalls. "The early English portions, which consist of the choir, its aisles, and small E. transepts, form one of the best examples of this style in the kingdom. The whole of this church deserves the study due to a cathedral; and though it be not so varied in its styles as some edifices, it claims attention for its purity and good preservation." (*Rickman's Gothic Architecture*, p. 221.) The ruins of an ancient palace of the archbishops of York, the favourite summer retreat of Cardinal Wolsey, stand in the park, and a part is now appropriated as a sessions house for the liberty. The general bridewell for the county is at Southwell, which has also meeting-houses for Wesleyans and Baptists, and a free-school, with 2 scholarships at St. John's Coll., Cambridge. What little trade the town possesses is chiefly in malt, hops, and tan. The living of Southwell is a vicarage, worth 144l. a year, in the gift of the prebendary of Southwell. (*Eccl. Rev. Rep.*) Market-days, Saturday; fairs, Whit-Monday and Oct. 21.

SOUTHWOLD, a sea-port, mun. bor., market-town, and par. of England, hund. Blything, on an eminence on the E. coast of the co. Suffolk, about 1 m. N. from the mouth of the Blythe, 30 m. N.E. Ipswich, and 94 m. N. W. London. Pop., in 1831, 2,079. "It consists principally of a long row of houses commencing near the bridge over the Bass Creek, and extending S.W. to the edge of the cliff,

SPAIN.

705

besides numerous other houses with gardens, lying N. and S. of the principal street. Near the sea there are several good houses, but the others are chiefly of an inferior description. The town is not lighted nor watched; but the footpaths have been partly flagged by subscription, and the inhabs. are well supplied with water from several excellent springs." The guildhall is a handsome stone building, and a new gaol was built in 1819. On the cliffs are two batteries, one of which has a parapet and 6 eighteen-pounders, but the other has only 2 guns. The church, built in the middle of the 15th century, is a fine edifice in the later English style, with a lofty tower and steeple of freestone intermingled with flint of various colours. The S. porch is extremely elegant; and above the clerestory roof is a light, open lantern. The interior is highly ornamented with gilding and carved work; and on the whole this is one of the finest churches in the co. The Independents, Baptists, and Wesleyan Methodists have each places of worship; the town, also, has 3 Sunday-schools and a national school. "The retail trade of Southwold is trifling; but a somewhat more important traffic is carried on in the importation of coal and the exportation of salt (which is made here), red herrings, and malt. The principal business, however, is connected with the influx of visitors, who resort to the town as a watering-place during the summer season," and for whose accommodation there are baths, reading-rooms, a grand promenade, &c. (*Mus. Bound. Rep.*) The entrance to the haven is by the river, and vessels trading to this port land their goods at Black-shore quay, about $\frac{1}{2}$ m. S.S.W. the town. The superintendence of the haven is vested in commissioners; and it has been much improved by the erection of 2 piers at the mouth of the river, which has been made navigable to Halesworth, 8 m. W. by N. the town. The bor. of Southwold, which was incorporated in the reign of Henry VII., is governed under the Mun. Reform Act by a mayor and 3 aldermen, with 12 councillors. A court of record is established for the recovery of small debts, and there is a court of admiralty for the regulation of the port, which is subordinate to that of Yarmouth. Markets on Thursday: fairs, Trinity-Monday, and Aug. 24.

Southwold, or Sole Bay, E. of the town, is celebrated as the scene of the great naval engagement which took place on the 28th of May, 1672, between the combined English and French fleets under the Duke of York (afterwards James II.) and Marshal d'Etréps and a Dutch fleet under the famous De Ruyter. The action was most obstinately contested; the loss on both sides being very great and nearly equal. The Earl of Sandwich, who behaved with the greatest gallantry, was blown up along with his ship. The French suffered but little, in consequence, as is supposed, of their having received secret instructions to spare their ships. (*Hume*, cap. 65.)

SPA, a town and watering-place of Belgium, prov. Liege, on the borders of Rhenish Prussia, 14 m. S.E. Liege. It consists of "a cluster of neat white houses, thrown into the form of two or three irregular streets and open promenades, the whole embowered amidst trees and gardens, and overhung on the N. and E. by a woody mountain range." (*Chambers's Tour on the Continent.*) It was at one period a place of great resort, and so highly distinguished for its mineral waters, that "Spa" became a common name for mineral springs and bathing places wherever found. One of its greatest patrons was Peter the Great of Russia, who frequently visited it, and built the pump-room over the main spring, the only edifice in the place having any architectural pretensions. It is now, however, greatly fallen off. The tide of fashion has set in favour of Carlsbad and Wiesbaden; and it is not supposed to have more than about 3,000 resident inhabs. The *Pouillon*, or main spring, is a strong and active chalybeate, impregnated with carbonic acid gas, which gives it vivacity, and fits it for being preserved and sent in bottles to all parts of the world. There are several similar springs at from 2 to 3 m. from the town, at all of which there are pump-rooms, and to some baths are attached. Spa has two libraries with well supplied reading-rooms, a theatre, card-rooms, &c., a large par. church, and a Capuchin convent; and during the season an English church is opened. The hotels and lodging-houses are very respectable, and are abundantly supplied with provisions. A manufacture of painted wooden boxes, &c., carried on in the town, employs a good many hands. (*Chambers's Tour in Ed. Journal, Murray's Handb.; Tennent's Belgium, &c.*)

SPAIN (an. *Hispania*, Span. *España*, Fr. *Espagne*), an extensive and once powerful kingdom of S. Europe, occupying the E. and largest portion of its S.W. peninsula; between lat. 36° 5' and 43° 30' N., and long. 3° 20' E., and 9° 10' W.; having N.E. France, from which it is separated by the Pyrenees; N. the Bay of Biscay; W. Portugal and the Atlantic; and S. and E. the Straits of Gibraltar and the Mediterranean. Greatest length, E. to W., about 650 m.; greatest breadth, 550 m. The names, area, and pop. of its an. and mod. subdivisions have been stated as follows:—

The shape of Spain resembles that of a very irregular pentagon, the longest side of which faces the N. The coast line is, on the whole, pretty regular, without those great and sudden indentations that characterise the shores of many other countries, though an exception may be made as regards the coast of Galicia, which is fringed with bays and headlands, the principal among the former being the Bays of Betanzos, Pontevedra, and Vigo; and among the latter the Capes Estaca, Ortegal, and Finisterre. The other capes of Spain are principally on the coast of the Mediterranean. C. Tarifa abuts on the Strait of Gibraltar; and further N. are Capes Gata, Palos, La Nao, and Creux, the last being the extreme E. point of the peninsula. The surface is very much diversified, and intersected with mountains; but the whole may be described as a table land of considerable elevation, Madrid, the cap., being 2,173 ft. above the sea, which is the average height of the towns in the interior. Five chains of mountains, are pretty clearly defined, running from E. to W. through the peninsula. 1. The range of the PYRENEES (which see) not only divides France from Spain, but runs in a continuous chain parallel to, and at a short distance

from, the N. shore upwards of 600 m. as far W. as C. Finisterre. The E. division is known as the Pyrenees properly so called, the W. portion consisting of the Asturian mountains: the highest point in the former is the Pic de Netore on Mount Maladetta (11,424 ft.), and in the latter the Peña de Pefiaranda, S.W. of Oviedo (11,031). 2. A range extends W.S.W. from the Ebro, near Tudela, dividing Old and New Castile, Leon and Extremadura, and thence running S.S.W., through Portugal, to Cape Roca, near Lisbon: the culminating point is the Sierra de Grados (10,552 ft.), at the S.W. angle of Old Castile; but the average height does not exceed 4,500 ft. 3. A chain branching S.W. from that last mentioned divides the basin of the Tagus from that of the Guadiana: the central portion, S. of Toledo, called the Sierra de Guadalupe, attains a height of 5,110. 4. A range, called the Sierra Morena, runs along the S. border of La Mancha, in New Castile, which, though not continuous and of no great extent, forms the watershed between the Guadiana and Guadalquivir. 5. The Sierra Nevada runs from C. Palos, near Carthagena, almost as far as Cadiz: it is at no great distance from the Mediterranean, the most elevated part being S.R. of Granada, where the Cerro de Mulahacen rises 11,660 ft. above the sea: the peak of Veleta is 11,385 ft. in height; and further W. the Serrania de Ronda attains an elevation of 6,011 ft., while the neighbouring town of Ronda is about 3,300 ft. above the sea. (See Essay on the Phys. Geog. of Spain, in *Laborde, Itinéraire d'Espagne*, vol. v. last ed.; *Bruguière, Orographie de l'Europe*; *Berghaus, Erdbeschreibung*, pp. 316-318; *Antillon*, p. 226-270. The altitudes are given exclusively from Bruguière.)

The mountain-chains now described regulate the course of the principal rivers, some of which are of great extent, and have numerous tributaries. Immediately S. of the Pyrenees is the Ebro, which, rising on the Asturian range, near Reynosa, runs S.E. through a succession of narrow valleys, receiving its chief tributaries from the S. face of the Pyrenees, and flows into the Mediterranean about 26 m. below Tortosa: its entire length somewhat exceeds 400 m., and the area of its basin is estimated by Berghaus (*Erdbeschreibung*, p. 237.) at 25,860 sq. m. Among the other rivers flowing into the Mediterranean are the Guadalquivir and Jucar, falling into the Bay of Valencia, and the Segura in Murcia: the rest are unimportant. Five large rivers run westward into the Atlantic Ocean. The most N. of these is the Minho, which rises in the Asturian mountains, and running first S. and then S.W., enters the sea a little below Caminha, after a course, including its windings, of about 150 m. The Douro rises in the mountains of Old Castile, a few miles N. of Soria, and takes a generally W. course, by Aranda, Tordesillas, and Zamora, as far as Miranda, where, turning southward, it forms a portion of the boundary of Portugal, through which it flows westward into the sea close to Oporto: its length is estimated at 500 m., and the country drained by itself and tributaries somewhat exceeds 34,000 sq. m. The Tagus has its source in the Sierra de Albarracin, in Aragon, whence it flows W.S.W. by Aranjuez, Toledo, Talavera, and Alcantara, to the confines of Portugal: it then turns S.S.W., and, after expanding into a fine estuary, enters the Atlantic, a little below Lisbon, built on its N. bank. The Tagus has numerous important tributaries, the chief of which are the Henares, Alberche, Alagon, and Zatas, the last being in Portugal: the extent of its basin is estimated at 29,000 sq. m. The Guadiana, rising in La Mancha, runs first N.W., then W. as far as Badajoz, where it curves southward, and enters the sea at Ayamonte, after a course of 420 m.: it has several pretty large tributaries, and drains an area of about 25,600 sq. m. The Guadalquivir, which, with its tributaries, drains a large portion of Andalusia, rises in the Sierra de Alcaraz, and taking a S.S.W. direction by Andujar, Villafranca, Cordova, and Seville, turns southward, and after crossing a low, unhealthy swamp, enters the Atlantic at San Lucar, after a course of 320 m.: its largest affluent is the Genil, and the area of the entire basin is nearly 18,000 sq. m. But, with the exception of those portions of the Douro and Tagus within the limits of Portugal, these rivers, notwithstanding their length, offer few advantages for navigation, owing to the rocks, shallows, and falls with which they are encumbered.

The Ebro has, however, been made navigable to a considerable extent by means of the Canal of Aragon; and the channel of the Tagus is also in course of being improved, so as to make it accessible for boats as far as Aranjuez. Vessels of 100 tons ascend the Guadalquivir, within about 8 m. of Seville. The rivers on the N. side of Spain are comparatively insignificant, owing to the closeness of the Asturian mountains to the sea: one of these, the Bidasoa, forms the dividing line between France and Spain. There are no lakes of any considerable size, though in the Pyrenees and other chains there are several small mountain-lakes. Swamps and morasses,

however, are both numerous and extensive; the principal being the Gallocante, in Aragon; the Nave, near Palencia, and the Lagunes of Palomares and Caldera.

A central band of granite and mica-schist stretches along the Pyrenees from the Mediterranean to the Bay of Biscay, flanked successively by beds of secondary and cretaceous formations: the primary rocks, however, are by no means so extensive as in the Alps, and do not extend westward beyond the Bidassoa, all the mountains of Asturias and Galicia being of the sandstone and carboniferous limestone that form the lower parts of the main chain. The lofty range that divides the two Castiles, and forms the watershed between the Douro and Tagus, consists chiefly of granite and other primary rocks, which pass eastward under the sandstone, forming the lofty uplands of Soria, in Old Castile: it is flanked on both sides by sandstone and limestone; but in New Castile are extensive beds composed of the *débris* of primitive rocks associated with marls and gypsum, the marly subsoil being remarkable for the fertility of the surface, whereas the gypseous districts are remarkable for their barrenness and dismal appearance, such as is exhibited in the neighbourhood of Madrid. The Sierra Morena also exhibits a large proportion of primary rocks, partly covered by secondary and other rocks, with the nature of which we are but little acquainted. The Sierra Nevada is a mass of mica-slate and serpentine, flanked northward by secondary and more recent rocks, containing some of the richest marbles of Spain, many of which adorn the churches of Granada and Seville: the S. side, forming the deep valleys of the Alpujarras, is principally of secondary limestone resting on slate (highly metalliferous), greenstone, and blue limestone. The limestone strata of the Sierra de Gador are remarkable for lead mines, which are extremely rich, and sufficient to supply the whole of Europe with this mineral for many centuries to come. With respect, indeed, to the mineral wealth of Spain, there can be little doubt that it is very great, and by no means exhausted by the workings of the ancients. There are valuable copper-mines in the Sierra Morena and the Alpujarras, and near Teruel in Aragon. Quicksilver is found at Almaden, on the N. side of the Sierra Morena, and graphite occurs near Marbella, in the neighbourhood of Malaga. Graphite is found, also, in the high Pyrenees, scarcely inferior to that of Cumberland, but wholly unwrought. Sulphur occurs in several parts of Valencia, and saltpetre, alum, and salt are found in many parts of the country. Iron and coal abound in the mountains of Biscay and Asturias, and are wrought to a considerable extent; besides which there are extensive iron mines, with smelting-houses, &c., at Marbella, near Malaga, and in the Sierra Morena, near Pedroso. Coal occurs, also, in large seams throughout Aragon and Catalonia, as well as on the Guadalquivir near Seville; and traces of the same mineral have been discovered near Malaga.

"The soil of the Peninsula exhibits great diversities. The central region consists for the most part of arid, unsheltered plains either of sand or gypsum, intersected with lofty mountains, which reflect with intolerable fierceness the scorching heat of summer, and sharpen into more intense keenness the intense cold of winter. The lower region of the coast, sloping gradually towards the sea, is broken into an alternation of mountains and valleys, producing the most agreeable variety, and presenting a pleasant contrast to the bleak and barren sameness which characterises the central region. It is every where fertile, or may be rendered so by irrigation." (*Foreign Quarterly Review*, No. IX. p. 152, written by the author of this article.) The alluvial soil of Old Castile is tolerably productive, even without irrigation: New Castile has every variety, from the gypseous marl composing the poor soil about Madrid, to the red marl of Guadalaxara and the limestone of Arganda. The valleys of the Sierra Morena, and the whole of Extremadura, have a soil formed of detritus from primary rocks, and cannot be excelled in beauty and natural fertility. The soil of Andalusia is chiefly of marl and clay interspersed with red sandstone marls, and it is by irrigation only that it can be made productive. The Vega of Malaga, however, is naturally of surprising fertility, owing partly to the long establishment of irrigation, but partly, also, to the fact of its being in a great measure alluvial. Valencia has a poor ungrateful soil, yielding crops only by forced cultivation, and the use of water. In Catalonia and Aragon the detritus of limestone is found alternating with fine red marls and waste tracts of gypseous marls, similar to those near Madrid. "On the whole, the valleys of the Sierra Morena and the Alcarria, the provinces of Toledo and Guadalaxara, the Vega of Malaga, and the country between Gibraltar and Cadiz, would probably repay the labours of agriculture better than other parts of Spain." (*Cook's Sketches in Spain*, ii. 335., in which are many valuable remarks on its geology and internal economy.)

The climate of Spain is greatly diversified, being modified by the physical conformation of the country. The temperature of the air always varying less near the coast than in the interior, is much more equable in the maritime than the other parts. On the N. and W. coast westerly winds prevail; and, being loaded with moisture from the Atlantic, discharge abundant rains in winter and spring. The coast of the Mediterranean has a calmer atmosphere, with a prevalence of E. winds, and a temperature generally rising above 57° Fahr., and seldom descending so low as 32°. Winter, indeed, is almost unknown on a coast sheltered by the elevated land of the interior, and warmed by the rays of a cloudless sun; while the heat of summer is very great, and would be all but intolerable, were it not lessened by the sea breeze, which lasts during the greater part of the day. On the plateau of Castile, the mean height of which, according to Bruguière, is about 1,960 ft. above the sea, heat accumulates much more slowly, and it is only during the month of July that the temperature ascends as high as 77° Fahr. In August, the mornings and evenings begin to be cold; and in winter the severity of its climate forms a very striking contrast with the heats of summer. Except in the N. provs., the climate of Spain is every where remarkable for dryness; a freedom from rain, and a cloudless sky being advantages that may generally be counted on; but this dryness occasionally becomes so excessive that the rivers are dried up, vegetation destroyed, and men and animals die miserably of thirst. (*For. Quart. R.*, ix. 153.) Two kinds of winds are very troublesome in Spain. The *gallego*, a N. and N.W. wind, which comes down from Galicia, is very cold and piercing; causing, besides other diseases, painful affections of the eyes, often ending in blindness, which is very common in all the more elevated districts. This ophthalmia, however, is attributed by some writers to the vast quantities of minute nitrous particles blown up from the waste lands, and held in suspension by the wind. (*Faure, Souvenirs du Midi*, p. 5-8.) The S. provs. are visited by the *solano*, which, like the *scirocco* of Italy, relaxes the system, and produces giddiness, inflammation, and even death. Owing to its extreme and sudden variations, the climate of the central plateau is far from healthy. The Madrid cholera is always dangerous, and often fatal to strangers; besides which there is a general tendency to pulmonary consumption, and other diseases of the lungs. Scrofulous diseases are even more common than in Russia, and epilepsy is by no means rare. The yellow fever, which often ravages the S. provs., has created much discussion among physicians, some of whom treat it as epidemic, while others are of opinion that it is brought to Spain by infection. Insanity prevails more or less in all parts, but especially in the provs. bordering on the Mediterranean. (*Faure*, pp. 69-84.; and *For. Q. R.*, ix. 156-158.)

The mineral products of Spain are rich and various, and might certainly be made the source of vast wealth. By a curious coincidence Spain itself was to the ancient world, the principal source of the supply of the precious metals. It is exceedingly doubtful, however, notwithstanding the numerous statements to the contrary, whether the Carthaginians or Romans ever discovered any mines of gold and silver in Spain. The more probable opinion seems to be, that the gold was wholly obtained from washings; and that the silver, which was by far the more abundant and important product, was extracted from the lead, which was then raised, partly for the sake of the silver, in vast quantities. (*Antillon, Geografia*, 149.) The mine of Guadalcanal, which, according to Cook (ii. 73.), is the only one of silver that is now wrought, was, with that of Casalla and others, discovered long after Spain had been evacuated by the Romans. (*Antillon*, loc. cit.)

The most valuable of the existing Spanish mines are those of lead in Granada; and the supplies obtained from them during the last 30 years have been so large that they have occasioned the abandonment of several less productive mines in other countries, and a considerable fall in the price of lead. The quicksilver mines of Almaden, in La Mancha, are also extremely productive, and supply, indeed, most part of the quicksilver imported into this country, and large quantities for the New World. Exclusive of innumerable salt springs, there are mines of rock salt at Migranilla, in La Mancha, and the mountain of Cardona: in Catalonia, 17 m. N.W. Monserrat is a vast and solid mass of pure rock salt! The iron trade will be afterwards referred to; copper, tin, antimony, and other minerals are found in various parts of the country, with every variety of marble, and the finest building stone. There can, indeed, be no doubt, that, under a government capable of developing the national resources, the mineral wealth of Spain would be found to be equal, if not superior, to that of most other countries. *Vegetable and Animal Products.*—The wheat of Spain, though of very various qualities, is generally excellent, and its bread is said to be the best in Europe. In some dis-

tricts the quantity grown is insufficient for the consumption, the deficiency being made up from the surplus produce of other provs., or by importation, though, owing to the badness of the roads, and the consequent difficulty and cost of carriage, there is often a great difference in the prices of corn in markets at no great distance from each other. Wine is raised abundantly throughout the country; and the coast districts of Xeres, Rota, Malaga, Benicarlo, and Alicante, furnish large quantities for exportation. The wine of the interior, though seldom exported, in consequence of the bad roads and expense of transport, is sometimes of good quality; and that of Val de Peñas, in La Mancha, in particular, a dry red wine, has obtained a high reputation for its superior flavour and delicacy. Grapes are also exported, both in a fresh and dried state. Among the other productions of the soil are oats, barley, maize, rice, oil, sugar, hemp, flax, *esparto* or sedge, cotton, saffron, barilla, honey, and silk, with all the European vegetables, and some even of those of the warmer regions.

The fruits of the S. are lemons, bitter and sweet oranges, pomegranates, dates, olives, almonds, and pistachio nuts; apples, pears, cherries, peaches, and chestnuts are grown in the N. provs. Immense quantities of hazel nuts are exported from Catalonia, and the fruit of the carob-tree is used for feeding cattle. On the Pyrenees, Asturian mountains, the Sierra Morena, &c. are luxuriant forests; but, on the whole, Spain has less timber than any other extensive country of Europe; a circumstance owing, not to any inaptitude of the soil for the growth of forest trees, but to an inveterate and inexplicable prejudice of the people against trees, which are mercilessly cut down or destroyed before they attain any considerable size. Indeed, so universal is this propensity in the central provs., that the most rigorous measures are necessary to preserve the avenues of Aranjuez from wanton destruction; and all statutes for the encouragement of planting have signally failed of their object. (*Foreign Q. Review*, ix. 154, 155.) Spain has eight varieties of oaks; among which are the evergreen oak, or *Quercus ballota*, which has edible acorns, in taste resembling chestnuts; the cork-oak (*Q. suber*), and the cochineal-oak (*Q. coccifera*), on which is found the false cochineal, yielding a fine crimson dye. The true *Quercus robur*, however, which furnishes the best materials for ship-building, scarcely exists, except in the N. provs. (*Cook's Sketches*, ii. 242—255.) Among the other forest trees may be enumerated tamarisks, pines, beeches, chestnut trees, nut trees, firs, poplars, and the sumach (*Rhus coriaria*), the bark of which is used for tanning.

Among the animal products of Spain, the horse is entitled to particular notice. The Arabs, when in possession of the country, stocked it with their finest breeds; and though the race has degenerated, it still shows many of the points by which it was originally distinguished. In beauty, grace, and docility, the horses of Andalusia are said to be superior to those of England; but it may be doubted whether they are equal to the same amount of labour. In fact, the number of good horses is rapidly decreasing in Spain, chiefly owing to the preference given to mules for domestic and agricultural purposes: the importation of horses to improve the breed, and the exportation of colts, are alike forbidden, and "the number of horses bred at present is quite inconsiderable, notwithstanding the decrees, premiums and encouragements of every kind that have been offered by government. The celebrated breed of the sovereigns of Spain at Cordova, is nearly extinct; in the Serrania de Ronda (once the Cleveland of Spain) only miserable animals, called *serranos*, are now reared; the wealthiest Andalusian nobles have only 2 or 3 indifferent saddle-horses, and there is scarcely a horse in the whole country fit for the draught of artillery." (*Cook*, ii. 59—61.) Great numbers of mules are bred in Old Castile, being sent to come to their full size in the rich pastures of Estremadura, whence they are supplied to the rest of Spain. The asses are very different animals from those seen in England, being of a large size, carefully bred, and in strength, docility, and sure-footedness, nearly equal to the mules. Cattle are small, and not of fine appearance. The bull of Andalusia is found wild in the Sierra Morena. Hogs are bred in vast numbers, and those which feed on acorns are celebrated for the delicacy of their meat, which is, perhaps, unequalled. Sheep, however, are the favourite stock of Spain, and are every where raised in considerable numbers (see *post*); nor are there wanting wild animals, such as wolves, lynxes, wild cats, wild boars, and foxes. The bear, which used to be common two centuries ago, is now found only in the Pyrenees. Monkeys are met with in the Sierra de Ronda, besides which there are various reptiles, as chameleons, lizards (some 2 ft. in length), vipers, and snakes. Among the birds may be noticed several species of vultures, falcons, owls, ravens, magpies, Cornish choughs, partridges, quails, bustards,

and plovers. (*Cook's Sketches*, i. 58—62, 254—257.; and *For. Q. Review*, ix. 156.)

Agriculture. — "No country in Europe," says Laborde, "is so generally fertile as Spain, or has equal advantages at all seasons of the year. Spain, after its conquest by the Romans, became the granary of the Roman empire. Under the Goths vast canals and sluices were formed for irrigating the land, and the amount of corn then raised was sufficient not only for the home supply, but also, to a considerable extent, for exportation. Agriculture under the Moors was in a still more flourishing state; for when they invaded the country, they carried with them their methods of husbandry, broke up the uncultivated lands, augmented the number of plantations, carried the art of irrigation to a degree now scarcely attainable, introduced the culture of rice, and greatly improved the breed of horses: in fact, every kind of production was increased under their improving hands; and the era of their expulsion designates the epoch of the decline of agriculture. The Spaniards, thus deprived of the assistance of the Moors, were compelled to till the land themselves; but for such pursuits they possessed neither talents, activity, nor patient industry. Hence the whole system fell into a state of languor, from which it has, owing to several causes, never recovered." (*Laborde*, vol. iv.)

We have quoted this passage, because it states, in a few words, what has long been the popular opinion in regard to the ancient as compared with the modern state of Spain. We believe, however, that it is wholly erroneous. The fertility of the country has been greatly exaggerated; and we much doubt whether her agriculture was ever in so advanced a state as at this moment. A great portion of Spain is, owing to the heat of the climate and the want of water, wholly unfit for husbandry; and she has, in consequence of the frequency of droughts, been at all times subject to the most destructive famines. Owing to the numerous ridges of mountains by which she is intersected, her internal commerce has always laboured under the greatest difficulties; and there is no evidence that her artificial communications, that is, her roads, canals, bridges, &c., were at any former period in a more improved state than that in which we now find them. Owing to vicious institutions, bad government, and other causes, Spain has, for a lengthened period, continued stationary, or made but little progress, while other nations have advanced with giant steps in the career of improvement; but there is no real foundation for the prevalent notion of her having been comparatively well cultivated, rich, and industrious previously to the expulsion of the Moors, or in the reigns of Ferdinand and Isabella and Charles V. Capmany, in his *Questiones Criticas* (cap. i.), has proved, beyond all controversy, that there were in the 15th and 16th centuries the same complaints of the wretched state of agriculture, of the idleness of the Spaniards, of their contempt for industry and the useful arts, and their dependence on foreigners, that are still made against them. It is needless to say, that without tranquillity and good order there can be nothing like a flourishing agriculture. But at the very time that it is said to have been most flourishing, that is, previously to and during the reign of Ferdinand and Isabella, the Spanish historians represent the country as a prey to rapine, outrage, murder, and every sort of violence and disorder. Indeed, so early as the 13th century, the principal cities of Aragon and Castile had formed an association, called the *Santa*

Hermandad (Holy Brotherhood), for their mutual protection against the robbers and plunderers with which the country was infested; and during the reign of Ferdinand and Isabella this institution was still further extended. (*Robertson's Charles V.*, vol. i. note 36.) And if these facts were not enough to demonstrate the entire worthlessness of the statements as to the flourishing state of agriculture in Spain previously to the expulsion of the Moors, the organisation of the laws respecting the *mesta* (migratory flocks) would sufficiently evince the truth of what has now been advanced; for had the country not been at the time in a half-occupied semi-barbarous state, every one must see that the oppressive privileges conferred on the owners of the sheep never could have been carried into effect, or had any practical existence.

Having thus briefly disposed of the apocryphal statements as to the former flourishing state of agriculture in Spain, we have now to inquire into its present state, and the circumstances to which its long-continued depression are principally to be ascribed.

With the exception of a few districts which have peculiar facilities for irrigation, agriculture is in the most backward state imaginable. "Great part of the land is not tilled, and that which is tilled is executed in so careless and slovenly a manner, as to produce a starved crop of corn in spots where they might command the most abundant harvests. The corn is usually choked up with stones, filth, and weeds of every kind." (*Clarke's Letters*, p. 285.) Generally speaking, tillage farms are small, and rents low; but owing to the exorbitant taxes, and other expenses wholly exclusive of rent, the farmers are wretchedly poor, and when they require money, are obliged to obtain it at exorbitant interest, by mortgaging their crops. The system of letting land is very various, money rent being taken in some parts, while in others the rent consists of a stipulated quantity of produce, and in others the *métayer* system prevails. Generally, however, large estates are not let out in farms, but are managed by agents, who, for the most part, are totally ignorant of the business of agriculture, and whose great object is to squeeze out of the land all that it can be made to produce by the most compendious processes. Farm houses are rarely seen, except along the E. coast. The farmers live in huts of the meanest construction, crowded together in villages, so that farm buildings, often so expensive in other countries, cost almost nothing. Spring corn is generally sown on the ground before it has been turned up, and is still covered with the winter weeds; and is then ploughed down, or rather scratched in with a miserable instrument, and left to nature. Owing to the dryness of the climate, this is a less ruinous system than might have been supposed, for when the heat sets in the corn ripens, while the weeds perish. When ripe the corn is gathered in the field, and after being thrashed or trampled out by mules and asses, is left in heaps on the ground till it be sold. The corn speculators of Castile preserve grain in *silos*, or subterranean caves, sometimes for 5 or 6 years, or till a market opens for it. Public granaries, or *positos*, are, also, established in most districts, where corn may be warehoused till it can be disposed of. The implements of husbandry are of the rudest description: it is not uncommon in the S. to see men returning from plough seated on a mule, to the sides of which their whole apparatus is tied: the use of fanners is unknown, except in the neighbourhood of sea-port towns, to which they have been imported

from England; corn is winnowed by throwing it up in the air, and it is more frequently ground by hand, than by either wind or water mills. (*Cooke's Sketches*, ii. 40—42.) Land is not supposed to yield to the proprietors more than $1\frac{1}{2}$, or at most 2 per cent.; for, when the tenant has paid the direct taxes that fall upon the land, little more remains than half the produce, to pay both rent and labour. It is exceedingly difficult to estimate the rent of land by the English acre, from the great uncertainty and irregularity of the measures. The term *fanegada* is used to indicate the extent of land on which a *fanega* of wheat may be sown, an extent which varies in every village: this quantity of land, whatever it may be, lets, according to circumstances, at from 12s. to 24s., the average value of a fanega of wheat being about 3s. 6d. Vine and olive-lands are measured by the *aranzada*, an equally vague standard. The wages of farm labourers average about 13d. *per diem*; or, if boarded with their masters, from 6½d. to 10d. But, though tillage has been greatly extended during the present century, it is still true that in most parts of Spain no improvement has been made during the last 150 years. The principal exceptions are in Biscay, Navarre, and Aragon. In the first hoe and spade husbandry pretty generally prevails, and every inch of arable ground near the roads seems to be carefully cultivated. The wheat raised in Biscay perhaps exceeds the consumption of the district, and considerable crops are also raised of rye, maize, barley, and oats. In Leon, Castile, and Andalusia, agriculture, which is in the most degraded state, is confined to the growth of wheat.

The most careful cultivation is found in the *huertas*, or irrigated lands of Granada, Murcia, and Valencia. These tracts, indeed, are considered as the gardens of Spain, and abound not only with every variety of fruits, but all kinds of vegetables and plants, useful either as food or materials for manufactures. The mild red pepper raised in the *huerta* of Murcia is celebrated all over Spain, and forms a considerable article of trade with the interior. Rice is the chief product of Valencia. The sugar-cane of Granada and Valencia is as good as that of the West Indies; but it is cultivated at much greater expense, and its growth has, in consequence, been almost wholly abandoned. Considerable quantities of corn are raised in different parts along the S. E. coast. Mulberry-trees are carefully cultivated in the S. provinces; those of Murcia and Valencia are white, those of Granada black. In the cultivation of vines poles are not used; but the cuttings are planted, and not being permitted to attain any great height, gradually form thick and very stout stocks. *Espallera*, also, are numerous, especially in Andalusia, and the grapes on these vines attain an extraordinary size, the bunches often weighing from 12 to 14 lbs. The rich level lands produce the largest quantities of wine, but here, as elsewhere, that raised on gravelly soils on the hilly slopes is the best. The quality of the wine varies greatly in different districts; but it may be said with truth that, except the wines of Xeres, Rota, Malaga, Alicante, and Benicarlo, which are intended for exportation, few of the Spanish wines are equal even to those of third-rate quality in France. Being very generally kept in skins, smeared with pitch, they acquire an *olor de bota*, or peculiar taste, and a flavour not disliked by the natives, but very disagreeable to foreigners.

It appears, from the official returns published in 1803, which, though not to be altogether depended upon, are sufficiently accurate to give a

just notion of the general state of the country, that, taking the extent of Spain at between 18,900 and 19,000 sq. leagues, the surface was distributed nearly as follows:—

	Leagues.
Cultivated lands and fallows	4,310
Pastures and commons	11,658
Forests and copses	1,580
Mountains and rivers	1,342
	<hr/> 18,890 <hr/>

It is certain, from the increase of pop., and the nearly total cessation of importation since 1803, that the proportion of cultivated lands must have increased considerably in the interval, though at this moment they are still little more, perhaps, than about a fourth part of the entire surface. The Pyrenees, the hilly parts of Biscay and the Asturias, the vast plains of Andalusia, the two Castiles, Estremadura, and Leon, are almost wholly in pasture; and in some parts the traveller may journey for many miles without seeing either a house or an individual. In point of fact, however, half the pastures really consist of heaths, or of neglected tracts covered with thyme and other wild herbs, that at present are next to worthless. There are few or no irrigated meadows, and hay is seldom or never prepared for fodder. Indeed, notwithstanding the preference given to pasturage, and the privileges that have been long enjoyed by the migratory flocks, it is not supposed that the stock of sheep in Spain at this moment (1851) exceeds 13,000,000, or, at most, 14,000,000; whereas, in England, which has not 1-4th part of the pasture and waste land that belongs to Spain, the stock of sheep is certainly not under 25,000,000, while that of horses and cattle is proportionally great.

The Spaniards distinguish their sheep into the sedentary, or those who remain in the same place during the year; and the migratory, or those who move from place to place. The latter, or *transhumantes*, consisting chiefly of the merinos, or fine-woolled breeds, are depastured during winter in the vast plains of Andalusia, Castile, Leon, and Estremadura; and are driven in summer to the nearest mountains. These migratory flocks are collected for their journeys in large bodies of 10,000 and upwards, called *mestas*, their peregrinations being regulated by a peculiar code of laws, and by immemorial custom. It is obvious that this migratory system has originated in natural causes; and that, in fact, it is an important branch of the rural economy of Spain. In winter, when the mountains are covered with snow, the plains are in the greatest verdure and beauty; and in summer, again, when the herbage of the plains is withered and burnt up by the heat and drought, the pastures of the Sierras, and other mountain tracts, are in a state of comparative luxuriance. Nothing, therefore, can be more natural than this shifting of the flocks; it is for the mutual interest of the occupiers of the hills, and those of the plains, and no doubt has prevailed in Spain from the remotest antiquity, and will necessarily continue to prevail.

The laws and customs, however, under which the migrations of the flocks are conducted have been, for a lengthened period, singularly inexpedient and oppressive. It appears that, about the middle of the 14th century, the depopulation of large tracts of country by a pestilence gave a considerable extension to pasturage; and enabled the proprietors of the migratory flocks to usurp certain privileges, which they have since succeeded in maintaining. (*Townsend*, ii. 61.) Thus, they are not only allowed to drive them over village pastures and commons, but the pro-

prietors of such cultivated lands as lie in their path are obliged to leave for them a wide path, and, which is still worse, no new inclosures can be made in the line of their migrations, nor can any land that has once been in pasture be again cultivated till it has been offered to the *mesta* at a certain rate! In consequence of these perverse arrangements, disputes, which frequently terminate in bloodshed and murder, are perpetually taking place between the herdsmen and those through whose lands the flocks have to pass. On the whole, however, we incline to think that the mischiefs said to be entailed on Spain by the laws and customs in question have been a good deal exaggerated. As already seen the migration of the flocks is essential in Spanish rural economy; and it does not appear, were government to set resolutely about the matter, that any insuperable difficulty would have to be encountered in defining and fixing the roads to be taken by the flocks, and in otherwise regulating their migrations, so as to prevent them from being injurious to third parties.

It may be worth mentioning, that Capmany ascribes the first great improvement in the wool of Spain to the introduction of a flock of sheep from England, in 1394, being a portion of the dowry brought by Catherine, daughter of the Duke of Lancaster, to her husband, the eldest son of the King of Castile. (*See Questions Criticas*, 9.; and *Memorias Historicas sobre la Marina Comercio, &c., de Barcelona*, iii. 335.)

The low state of agriculture in Spain may be ascribed partly to physical and partly to moral causes. At the head of the former must be placed the heat of the climate, and the aridity of the soil. Most part of the rivers with which the country is intersected run in deep beds, and are but little available, except in a few favoured localities, for purposes of irrigation. Probably, however, moral have had still more influence than physical causes in retarding the progress of agriculture in the Peninsula. At the head of the former must be placed the vast extent of the lands belonging to the nobility, clergy, and corporations. Mr. Townsend mentions, that the estates of three great lords—the dukes of Osuna, Alba, and Medina Cœli, cover nearly the whole of the immense province of Andalusia, and several in the other provinces are hardly less extensive. (ii. 238.) These vast possessions have been uniformly held under strict entail; and, speaking generally, are all managed by stewards, anxious only to remit money to their masters, who are frequently in embarrassed circumstances. The younger branches of the great families, though they inherit all their pride, inherit little or none of their wealth. They are, for the most part, exceedingly ill-educated; and when not employed in government service, pass their days in a state of slothful dependence. It is singular, notwithstanding their immense possessions, that the Spanish grandees have little or no taste for a country life, or for the improvement of their estates; and the fact is, that from the one end of the Peninsula to the other, there is no such thing as a fine country seat. The great estates belonging to the corporations, or towns, are held in common; and, in consequence, are wholly, or almost wholly, in pasture. Luckily, however, the large estates that belonged to the church have been confiscated during the late revolutions; and their sale and division has materially increased the number of smaller proprietors, and given a stimulus to improvement; and a stop has also been put to the practice of entailing. The interruption given to labour, by the immense number of religious festivals and

saints' days, has, also, been exceedingly injurious to agriculture and all sorts of industry.

The Spanish character is also unsuitable to success in agriculture and manufactures. During the prolonged struggle with the Moors, a taste for daring adventures, and for an irregular predatory mode of life, was widely diffused throughout the nation; and the discovery and conquest of America, which occurred nearly at the same time that the power of the Moors was annihilated by the conquest of Granada, afforded a new and boundless field for the exercise of the peculiar taste and talents formed in the Moorish wars. In addition to the means thus afforded of arriving at wealth and distinction by a more compendious and less laborious, though more hazardous, route than that of sober industry, these honorary distinctions, of which the Spaniards are extremely fond, were conferred only on those who followed the profession of arms, and who could show that their ancestors had not degraded themselves by engaging in the debasing pursuits of agriculture, manufactures, and commerce! And while the higher and more aspiring classes were thus led to regard the useful arts with contempt and disdain, the multiplication of convents and such like establishments afforded the means of keeping a vast number of individuals in pampered idleness. We need not, therefore, wonder at the repeated complaints that have been made by native and foreign writers of the pride and laziness of the Spaniards. (See *Capmany, Questions Criticas*, pp. 46—49., &c.) What else could be expected in a country where agriculture and the useful arts have, for a lengthened period, been looked upon as mean and sordid, and below the attention of a gentleman? The heat of the climate was enough, of itself, to enervate the inhab., and to render them indolent; and when we add to this the powerful influence of the causes now shortly glanced at, with the want of leases and roads, and the oppressiveness of taxation, need we wonder at the backward state of agriculture and of the other useful arts?

There are several societies in Spain, assuming the title of "Friends of the Country," for the encouragement of agriculture and the arts; most of them were founded in the reign of Charles III., and were warmly patronised by Campomanes, the most enlightened minister of whom Spain has to boast, and by Count Florida-Blanca. Hitherto, however, they seem to have rendered but little service, if we except that of Madrid, to whose exertions the famous Memoir of Jovellamos (*Informe de la ley Agraria*) is principally to be ascribed. The reader will find this memoir in an English dress in the 4th volume of the translation of the *Itinéraire* of Laborde.

Manufactures. — It might have been expected, from the abundance of wool and silk in Spain, and her extensive colonies in America, that her manufactures would be in a comparatively flourishing state. This, however, is not, nor has it ever been, the case. Capmany, and other able writers, have shown that the statements as to the flourishing state of manufactures in Spain, in the 14th and 15th centuries, have no better foundation than those respecting the flourishing state of agriculture, and the magnitude of the pop. at the same period. Some of the circumstances that have contributed to depress agriculture have also contributed to depress manufactures; but they have, also, been affected by others of a peculiar description, among which may be specified the oppressive influence of the *alcabala*, and other taxes (see *post*), corporation

privileges, monopolies on the part of government, and the want of competition and emulation through the exclusion (in as far as practicable) of foreign manufactured goods. Catalonia, Biscay, and Valencia are the most industrious provinces, and in them manufactures are most advanced. Those of silk and cotton, especially the first, are carried on to a considerable extent in Barcelona, Valencia, and other towns; but though the fabrics be excellent, the colours are wretched. The blonde mantillas of Almagro, in La Mancha, are, perhaps, the best of the Spanish manufactured articles. Broad cloth is made at Alcoy, in Valencia; and coarse cloths (*pano pardo*) are extensively manufactured in Catalonia, and in various districts throughout the country. But, with the exception of silks, all the woven fabrics produced in Spain, whether woollens, cottons, or linens, are at once badly finished and enormously dear: even the coarse, hard-spun *mantas*, that serve the muleteers for cloaks and blankets, fetch prices that would astonish the peasantry of England and France. In the N. provs. tanning is the most important branch of manufacture, furnishing the principal supply of leather for the interior: the business was introduced by and is chiefly in the hands of refugee Basques from the French side of the Pyrenees. The few tan-works of Andalusia are mostly in the hands of Englishmen. The manufacture of paper and hats has been established with some success; and there are numerous potteries, though the products be principally of coarse quality. In Valencia and Catalonia, however, finer articles are made; but even there the art is only in its infancy. There is a royal porcelain manufactory at Madrid, on the plan of that of Sèvres, occasioning, like its prototype, a constant loss. Soap is made on a somewhat extensive scale in various parts of Spain, that of the best quality being exported. In Biscay, the production and manufacture of iron has been for many years conducted with considerable activity; and it is probable that the depression occasioned by the late civil war, of which Biscay was the principal seat, has already been removed. It is impossible, however, that the iron trade of Biscay, how abundant soever the ore, can rise to any great importance; since wood fuel is scarce, and coal, being at a considerable distance, and the roads extremely bad, is little used; while English coal, which might be procured at about 1-3rd the price, is strictly prohibited. Still, however, to some extent, at least, in almost every village of the prov., the ironware manufacture is carried on. Horse-shoes and nails, coarse locks, guns, and bedsteads, are the leading articles with which the Biscay manufacturers supply the interior: large copper utensils are also made on a considerable scale in this part of Spain. Muskets, pistols, and sabres are manufactured by the government in Valencia; and several minor establishments exist at Saragossa, Barcelona, Malaga, Cadiz, and Seville. Sword-blades of the finest temper and quality continue to be produced in the *Fabrica das Armas*, near Toledo; but the quantities are comparatively inconsiderable. The manufactures of saltpetre and gunpowder, brass cannon, tobacco, porcelain, tapestry, and mirrors, are conducted exclusively by government; the supply is very limited, the prices of the articles produced extravagantly high, and, excepting tobacco, they are all productive of loss. In some parts, mats, shoes, and other articles, are extensively made of the esparto rush.

Commerce. — It is the peculiar misfortune of Spain that every part of her political system has

been alike vicious and objectionable. Had her commercial policy been liberal, it would, in some degree, have compensated for the defects in the distribution of property and political power, and would, no doubt, have given a powerful stimulus to industry. But, unluckily, it has been in perfect harmony with her other institutions, and was, in all respects, worthy of the favourite seat and stronghold of the Inquisition. From the reign of Ferdinand and Isabella down almost to the present time, the policy, if so we may call it, of the Spanish government has been wholly anti-commercial. Their grand object has been to exclude foreign manufactures from the Peninsula, and to preserve a monopoly of its markets, as well as of those in the colonies, to the home manufacturers. The reader, however, can hardly require to be told, that their efforts to bring about this result have been signally unsuccessful. The oppressive taxes imposed on the manufacturers, the multiplication of fasts and holidays, the government monopolies, the badness of the roads and other means of communication, made it impossible for the Spanish manufacturers, even if they had evinced greater enterprise and industry than they have done, to produce manufactured articles as cheap as the English, the French, and others less unfavourably situated. Under such circumstances, the prohibition of certain descriptions of commodities, and the oppressive duties laid on others, had no effect except to suppress the legitimate commerce of the country, and to throw it wholly, or almost wholly, into the hands of smugglers. Any one who takes up a map of Spain must be satisfied at a glance that it would be impossible, even for an army of customs' officers, to prevent her being deluged with smuggled products, provided they were materially cheaper than her native products; for, besides her extensive sea frontier, they may be introduced by way of France and Portugal, and also through the Basque Provinces, which have distinct laws, and enjoy an exemption from the commercial code inflicted on the rest of the kingdom. We need not, therefore, be surprised that every effort to prevent the clandestine introduction of foreign productions should have completely failed. The severities occasionally inflicted on the smugglers, instead of abating, seem really to have increased, the evil. The contraband trade has long been a favourite occupation, and has been eagerly followed by the adventurous, the necessitous, and the desperate. It is believed that for nearly three centuries from 100,000 to 150,000 individuals have been pretty constantly engaged in this occupation; that is, they have been engaged in trampling on the laws, obstructing their officers, and committing acts of violence and bloodshed. When Mr. Townsend travelled in Spain, the country was a prey to the disorders occasioned by this wretched system. But it was to no purpose that the experience of two centuries, and the writings of many able men, had conclusively demonstrated its destructive influence. The government and the people, thanks to the influence of the Inquisition and the clergy, were so ignorant and infatuated as to shut their eyes to its effects, and to resist every attempt to modify it, or to render it less hostile to the public interests.

And, strange to say, notwithstanding all the vicissitudes Spain has undergone in the interval, her old anti-commercial policy continued to maintain its ascendancy down to 1849. But the leading Spanish statesmen having been, at length, satisfied of the disastrous influence of the old

system, a vigorous effort was made, in the year now mentioned, to introduce a more rational tariff; and notwithstanding the selfish and shortsighted opposition of the Catalans and others, the new tariff was happily passed into a law. It is true that it leaves much to be desired; but it is, at the same time, a vast improvement on the system by which it was preceded; and it is especially valuable as being the first step in the introduction of a new and more liberal and rational policy. In a few cases the duties on importation have been increased, but in the great majority of instances they have been reduced, and the greater number of the articles that were formerly prohibited are now admitted on the payment of duties. The following are the bases of the new tariff, viz.:—

"Machines and instruments necessary for agricultural, manufacturing, and mining operations, to pay a duty of from 1 to 14 per cent. *ad valorem*."

"Raw material not abundantly produced by Spain, and used in the operations of the national industry, whatever be the form or the increase of value that it may acquire, to pay from 1 to 14 per cent."

"Raw material similar to that abundantly produced by Spain, productive agents in the same case, such as coal and coke, and articles of merchandise of foreign manufacture which may compete with those of the same kind and quality manufactured in Spain, to pay from 25 to 50 per cent."

N. B.—Cottons and silks come under this class. The duties on the former are generally about 35 per cent. *ad valorem*."

"Foreign produce and manufactures required for consumption, and not supplied by the national industry, to pay a *maximum* of 15 per cent., and at the utmost 20 per cent. in every exceptional case."

"The duties hitherto levied on the colonial produce of foreign countries to be suitably increased."

"A discriminating duty of 20 per cent. to be charged on articles imported in foreign bottoms; and on those articles which contribute most to the support of the national navigation the discriminating duty may be raised to 50 per cent."

The prohibited imports are arms, projectiles, and munitions of war, including all kinds of gunpowder, quicksilver, charts published by the Admiralty, and reprinted abroad; maps and plans by Spaniards, during copyright; cinabar; vessels constructed of wood of less burden than 300 tons, of 20 quintals each; grain, flour, biscuit, bread, and macaroni, &c., for soup, not admitted by the corn law; books and prints in Spanish, by Spanish authors, if not imported by those individuals during copyright; missals, breviaries, and other books of liturgy (dictionaries, vocabularies, insignias, devices, and military ornaments are not included in this prohibition); pictures, &c., offensive to morality, or ridiculing the Catholic religion; common salt, tobacco, shoes, and ready-made clothing, except for the private use of travellers; chemical preparations forbidden by the sanitary laws.

Moderate export duties to be levied on antimony or galena, not argentiferous; black copper, roughly melted; litharge containing less than an ounce of silver per quintal; pig lead, raw silk.

Prohibited exports.—Cork in the bark of the province of Gerona; litharge containing an ounce and upwards of silver per quintal; argentiferous galena; lead containing 24 drachms and upwards of silver per quintal; cotton, hempen, and woollen rags, and worn-out articles of those materials.

The high discriminating duty on goods imported in foreign bottoms is the most objectionable feature in this tariff; though we can hardly be surprised at the Spaniards continuing to act on a principle that was acted upon down almost till yesterday by the English and the Americans. We believe, however, that it will be far more injurious to themselves than to any one else; and that its effect will be to lessen and embarrass their trade without really providing employment for Spanish merchantmen.

To the other facilities for smuggling in Spain must be added the venality and corruption of the customs' officers. Notwithstanding his *espionage*, Mr. Ford bears testimony to its universality. He says, "Every lock in Spain is to be picked with a silver key, and every difficulty smoothed

by a properly administered tribe. The customs expounders have been defined to be gentlemen, who, under the pretence of searching portmanteaus, take money on the highway without incurring the disgrace of begging or the danger of robbing, and practically they worry honest travellers who won't pay them, as much as they facilitate those who will." But in truth this venality is not confined to the revenue officers, but pervades and debases all classes, from the highest to the lowest.

We incline to think that, allowing for smuggling, the import and export trade of Spain might each be estimated, previously to the late change in the tariff, at about \$,000,000 sterling, or, perhaps, a little more. And, considering the vast, and, as it were, unexplored resources of the country, and the infinite variety of desirable products she could supply to others, we have no doubt, that, under a really free commercial system, her commerce would speedily be doubled, and that, at no very distant period, it would be increased in a much greater proportion.

The great articles of export from Spain consist (exclusive of silk manufactures) of raw products. Of these, wine, olive oil, wool, fruits of various kinds, lead, quinquina, brandy, cork-wood, silk, raw silk, wheat, &c. are the most important, and are almost all susceptible of an indefinite increase.

The great variety of imports are colonial products, obtained principally from Cuba, Porto Rico, &c., cottons and cotton goods, boots, and hamp and lace, woolsens, coated oth, hardware, glass and earthenware, timber, rice, hides, butter and cheese, &c. Sustained by

An Account of the Quantities and Values of the principal Articles of Native Produce exported from Spain in 1680, showing, also, the proportional Value of each Article

[illegible]

The importance of the trade that Spain formerly enjoyed on with her vast possessions in the New World.

was, at all times, much exaggerated; and the, in truth, was little better than an agent in the business, the greater part of the goods sent in Spanish bottoms to the colonies being, to verify the property of foreign merchants. Spain, notwithstanding the emancipation of Mexico and South America, has still some very valuable colonies; and, if nothing else can the emancipating progress made by Cuba and Porto Rico, since the abolition of the prohibitive system, should satisfy her of its excessive tendency.

Wool used to be a leading article of export (and this country from Spain, but now, though our imports of wool have vastly increased, they are principally supplied by the colonies in Australia, and by Germany, Russia, India, &c. The quantities brought from Spain have, indeed, become quite inconsiderable, as much so, 1845, while in 1846 she supplied us with only 127,220 lbs., our total imports amounted to the immense quantity of 72,308,647 lbs. With goatsheep and rabbits are at present the principal articles of importation from Spain. At an average of the 6 years ending with 1847 the declared value of the exports from the U. K. to Spain amounted to £70,000 a year. But a considerable portion of the exports to Portugal, Gibraltar and Malta find their way into Spain by the intervention of the smuggler and some portion also, of the exports to France. The direct exports to Spain in 1846, amounted to £74,000, not a third part of what they would be if Spain adopted a really free commercial system.

Due to the badness of the roads, and their unfitted for carriages, the principal carriers of merchandise are the *arrows* or *muletrains*, who traverse the country in all directions along better tracks, many of which are accessible only to them. They form a large portion of the pastoral population, and, on the whole, have a good character for honesty to their employers, though they are nearly all more or less engaged in smuggling transients. The greater of the traffic may be estimated from the fact, that about three fourths of the entire inland traffic is now carried on by their means. Recently, however, waggonways have begun to be introduced on all the practicable roads, and should the latter be improved, the business of the *arrows* will proportionately fall off.

Currency. The trade of a banker, as it is understood in Great Britain is unknown in Spain. But several banks have been established in Madrid, and there is an extensive circulation of inland bills of exchange. All merchants in good credit and themselves bankers, do banking business, and have agents and correspondents in the different towns, to facilitate their operations, but there is, notwithstanding considerable difficulty in remitting money from place to place, and a different rate of exchange frequently exists between towns only a few leagues distant. In ordinary transactions there are no restrictions for cash, and a good deal of trouble and inconvenience is experienced in counting, weighing, and weighing the coins.

Accounts are kept in real de vellon, of which about 50 are equivalent to £1. The pinto is worth 1/4 of the British currency. The money in circulation consists of gold and silver coins of very various value and of copper. Dollars are rarely seen except by the N and some the one-cent is everywhere of the pretium they bear to France to which they are exchanged in large quantities, notwithstanding the practical consequence on their repatriation. Travellers are allowed to carry out of the country 5000 fr their equiptment, amounting to 500 in gold only, and should they be taxed on examination, in case more, the whole may be seized. On is sold by the grove agent, 100 of which are equal to 500 English wine gallons. 4 arrobas are equal to a quintal, or 100 English pounds. The cahin, or measure for corn, is divided into 12 toman, 3 of the latter being equal to a quarter. One hundred Spanish cords, or yards are equal to 500 Eng. yards, and a Spanish league contains 3 1/2 leagues. The traveller tries in vain to find a rule whereby he may compare the Spanish land measures with the English acre, and, with respect both to weights and measures generally they vary greatly in different sections.

Roads and Railroads.—Spain is singularly deficient of roads and other means for the speedy and easy transport of travellers and products from place to place. The king's highways 'camino reales' the only roads worthy of the name, extend only between the more important places some of them, as, for instance, those between the capital and Pamplona, Saragossa, Burgos, Seville, and Granada, are, generally speaking, kept in good repair, and the great road from Pamplona, by Vittoria, Burgos and Valladolid, to Madrid, is rated by several travellers to be scarcely inferior to the second-rate roads of England. The great road to Valencia, though probably somewhat improved since the revolution, was formerly in a wretched state and so likewise is that running by Teracena and Alcala to Murcia. In Malaga the roads are comparatively numerous and good, stage-coaches, also, run between the more important towns. The road from Saragossa to Barcelona is in good repair, and a difference has been attributed

on it since 1831. The roads of Biscay and Navarre, also (owing to their being placed under a provincial government), are more numerous, better constructed, and more carefully managed, than in the rest of the country. The great complaint with respect to these roads, whether originally made with road-metal, or formed partly by tracks of carts, and afterwards improved, is, that they are seldom provided with bridges over the numerous torrents pervading the country, and scarcely ever kept in proper repair. The mountain-roads are mere paths worn by the feet of the mules during a long series of years. The revenue applicable to the construction and repair of roads is derived partly from local taxes, levied by postage-dues, and duties on articles of consumption; and partly, also, on tolls levied at intervals of 10 or 12 English miles. The tolls appear to be light; but the government is said to derive from them a greater revenue than it expends on the roads. The *caminos reales* are under the superintendence of a board under the presidency of the Board of Finance, and the government funds are available only for these roads, the rest being left either to the chance sums levied on travellers, or to the wheels of carts and the feet of mules! With respect to the sums of money employed in repairing roads in Spain, it may suffice to state, that although that country be more than three times the size of England, and naturally more difficult, the outlay on roads in it is hardly one twentieth part the sum expended on those in England. The diligences on the principal roads are decidedly better than might have been expected, and travel at the rate of 6 or 7 m. an hour.

Travelling in Spain is generally regarded by most foreigners as extremely dangerous, as well as slow and laborious. And though the risk of attack from banditti and robbers has been much exaggerated, it has been, and in some districts still is, far from inconsiderable. We borrow from Mr. Ford the following statements:—“The *Ladrones en grande* are an organised gang of well-mounted, well-armed men, from ten to fourteen in number, and commanded by a chief; and as they seldom attack travellers except at a great advantage, it is better to lose one's dollars than one's life, and to submit with a good grace to the polite request of putting your face, mouth downwards, into the mud,—the *Boja abajo*, which will take no denial: not, however, that we ever heard of its being strictly enforced as regards any of our countrymen. The next class are the *Rateros*, the rats. These are not organised permanent bodies, but skulking, ill-conditioned footpads, who lurk about suspicious *ventus*, on the look-out for an accidental affair. They seldom attack armed and prepared persons. A lower ruffian still is the *Raterillo*, or small rat, who is a solitary performer, confining his attacks to the utterly defenceless.

“The regular and only really formidable robbers have almost disappeared, in consequence of the institution of a body of picked and well-armed men, who are stationed in the principal routes as escorts and patrols. They are called *guardias civiles*, to distinguish them from *military* guards. The system is borrowed from the gendarmerie of France, whence the troopers are called by the people *hijos de Luis-Felipe*, sons of Louis-Philippe, and *Polizones*, a new word coined out of the French *polissons*, or rascals. Diligences, in periods and localities of danger, are usually provided with armed guards of their own; and there is also a body of armed men on foot, called *Miguelites*, whose business it is to keep the peace, and by whom convoys of value and travellers of rank are escorted. There are few places in which an extempore protection may not be hired of *Escopeteros*, or men armed with a gun, which in truth is the definition of half the Iberian family, when outside a town's wall. Except when ladies are in the case, and the localities are notoriously infested for the moment, all these precautions are needless. A riding party of armed Englishmen may dismiss the bugbear altogether, from the Pyrenees to the Straits of Gibraltar.”

Canals.—No country in Europe is worse provided with canals than Spain, though, looking at the map merely, one would suppose that in none were there greater facilities for their construction. But the imbecility of the government, the ignorance of the people, the porousness of the soil, and the heat of the climate, oppose very serious obstacles to their formation. Still, however, some advances have been made, and the government of Isabella II. may, in this respect, be advantageously contrasted with that of Charles II. During the reign of the latter, a company of Dutch contractors offered to render the Mançanares navigable from Madrid to where it falls into the Tagus, and the latter from that point to Lisbon, provided they were allowed to levy a duty for a certain number of years on the goods conveyed by this channel. The council of Castile took the proposal into their serious consideration, and, after maturely weighing it, decided, “That if it had pleased God that these two rivers should have been navigable, he would not have wanted human assistance to have made them such; but, as he had not done it, it is plain he did not think it proper

that it should be done. To attempt it, therefore, would be to violate the decrees of his providence, and to mend the imperfections which he designedly left in his works!” (*Clarke's Letters on Spain*, p. 284.)

But such undertakings are no longer looked upon as sinful, and several have been projected, and a few completed, since the accession of the Bourbon dynasty to the throne of Spain.

The canal of the Ebro, from Tudela to Santiago, 41 m. below Saragossa, was chiefly executed in the reigns of Charles III. and IV., under the administration of Count Florida-Blanca; and though of insufficient depth for navigation on any large scale, it is made available during nearly its whole extent for barges of small draught, besides being extremely useful for the irrigation of the surrounding country.

The most important project of this kind at present on foot is the canal of Castile, intended to open a communication between the vast and fertile plains of Old Castile and Leon, and the N. Sea, and to afford an outlet for their surplus produce. It has been constructed from Segovia on the S., past Valladolid and Palencia to Aguilar del Campo: a branch runs westward to the Rio Seco, and another is in course of construction to Burgos. The inefficiency of the engineering processes, the difficulty of procuring good labourers, and the nature of the soil, have presented serious obstacles to the undertaking, which has now been in progress, with certain intermissions, since 1753, and has not yet been completed! A large portion is now, however, available for navigation; and the advantages that would result from its completion are so great, that it may be expected that a vigorous effort will speedily be made to have it terminated. The navigation of the Tagus has, also, engaged the attention of different Spanish sovereigns; and at the close of the 16th century the river is said to have been made navigable for barges from Toledo to its mouth; but, if so, it was subsequently rendered useless through neglect, and it is only within the last few years that a company has undertaken to make it navigable from Aranjuez (23 m. above Toledo) down to Lisbon. The long-pending question respecting the right of the Spaniards to navigate the lower part of the river has been settled, and there is now no reason why small steamers should not ascend as high as Toledo into the richest part of New Castile, thus establishing a valuable trading connexion between the inhab. of the interior and of the greatest emporium on the coast of the Peninsula.

The Guadalquivir was once navigable for flat-bottomed boats up to Cordova, but Seville is the highest point reached at present. Many projects have been set on foot for improving the river by deepening the channel; but the great and sudden floods to which it is subject must operate as a bar to its successful navigation; nor, even if the part above Seville were considerably improved, is it at all probable that the bars and sand-banks of the marshy district known as the *Marisma* could be so far removed as to make the river accessible by sea-borne vessels even as far as Seville.

Population.—We have already noticed the exaggerated and unfounded statements, with respect to the former flourishing state of agriculture, manufactures, and commerce of Spain. Inasmuch, however, as the population of a country is mostly dependent on its agriculture and manufactures, it follows that the same facts and reasonings which show that their extent and prosperity in the 14th and 15th centuries had been greatly exaggerated, go far, also, to show that this must have been the case with regard to the accounts of the comparatively dense population of Spain at the era alluded to. Down to the 15th century, or to the junction of the crowns of Castile and Aragon by the marriage of Ferdinand and Isabella, Spain was divided into a number of states, between which the most violent animosities subsisted, and most parts of the Peninsula were a prey to violence and every species of disorder. It would be contradictory and absurd to suppose that a country placed under such circumstances could be densely peopled. And Capmany has conclusively shown that there are really no grounds whatever for thinking that Spain had been at any time more populous than at the period (1807) when his acute and learned work, the *Questiones Criticas*, was published.

No doubt, however, the population of Spain declined considerably during the disastrous reigns of Philip III., Philip IV., and Charles II. This decline has been ascribed, in great part at least, to the expulsion of the Moors in the reign of Philip III. But, though it be impossible too strongly to condemn this measure, and that of the expulsion of the Jews during the reign of Ferdinand and Isabella, and the detestable fanaticism in which these acts originated, we are, notwithstanding, inclined to think that their influence has been a good deal overrated. The numbers expelled were magnified far beyond the truth; and it is farther obvious that the vacuum, such as it was, created by their expulsion, would, in ordinary circumstances, have afforded a new field for the employment of those who continued in the country.

and have acted, in fact, as a stimulus to population. Neither are we inclined to lay any stress on the statements of those who contend that Spain was depopulated by the emigrations to America. These were far too inconsiderable to have any such result. No one pretends that the emigrations to America depopulate England; and yet they are far more extensive than those from Spain. Indeed, Ulloa, Ustariz, and Campomanes have conclusively shown that the emigrations from the Peninsula had, in no degree, the effect ascribed to them.

The truth is, that the decline of pop. between the demise of Philip II. and the termination of the war of the succession, was a consequence of continued and systematic misgovernment, rather than of any particular acts of oppression. The rapacity, intolerance, and influence of the Spanish clergy, the *felo de se* character of her financial system, the destructive contests in which she was engaged, the weakness of her sovereigns, and, in a word, her wretched internal policy, prostrated her energies, paralysed her industry, and not only prevented her recovering from, but aggravated, the wounds inflicted by the bigotry of her rulers. But, under the milder, more intelligent, and equitable administration of the Bourbons, some improvements took place; and the pop. having increased gradually, though slowly, during the whole course of last century, is now certainly as great as at any former period of her history, and perhaps greater. "No por eso puede decirse, que la España haya estado mas poblado que al presente, ni en tiempo de los Romanos, ni en el siglo 16; en cuya época suponen algunos escritores arbitrariamente que llegó a 20 ó 21 millones el número de sus habitantes. Por el contrario, todos los datos mas exactos, y las combinaciones mas racionales, persuaden, que no hubo entonces sobre la superficie de España mas de los 10½ millones de almas, a que el ultimo censo reduce su poblacion actual." (Antillon, *Geografia*, 147.) In 1787 the pop. amounted to 10,268,150, or perhaps 10½ millions, as it is believed, on apparently good grounds, that the official returns were below the mark; and since then it has increased nearly two millions.

Under the existing constitution, there is to be a deputy for every 50,000 inhabs.; and according to the decree issued on the 3d of Aug. 1837, appointing the deputies for the different provinces, the total pop. of the kingdom amounted to 12,168,000 (see Table at the beginning of this article). We believe, however, that no very great dependence can be placed on this return, though, probably, in the result it is not far from accurate.

Religion.—Spain has long been, and still is, the favourite seat of the Rom. Cath. religion, the country in which it has been maintained in the greatest purity, and to the exclusion of every other. The Inquisition was introduced, or, at all events, was vested with a vast increase of power, in the reign of Ferdinand and Isabella; and that formidable tribunal ultimately succeeded, by dint of the stake and the rack, and such like atrocious means, in exterminating heresy, or, in other words, all difference of opinion as to religious matters in Spain; and it was, also, mainly instrumental in prevailing on its weak and bigoted sovereigns to banish the Moors. According to Llorente, no fewer than 13,000 individuals, accused of heresy, were publicly burned by the different tribunals of Castile and Aragon; and 191,413, accused of the same offence, suffered other punishments in the brief space between the establishment of the modern Inquisition in 1481 and 1518, only two years after the death of Ferdinand; and since then the number of its victims has been incomparably greater! (*Prescott's Ferdinand and Isabella*, iii. 465.) Probably this statement may be exaggerated; but it is, notwithstanding, abundantly certain, that all other persecutions of which we have any authentic accounts have been mild compared with those inflicted by this blood-thirsty tribunal. In point of fact, however, the mischievous influence of the Inquisition did not consist so much in its judicial murders, and other atrocities perpetrated in the sacred name of religion, as in its deadly influence over the mind and feelings of the nation. It was, as every one knows, quite as hostile to all sorts of political and philosophical knowledge as to heresy in religion; it was, in fact, the deadly foe of every thing like free inquiry; and while the importation of most useful works from foreign countries was a capital offence, nothing could be printed at home unless it were approved by the inquisitors. Under such circumstances, need we wonder at the ignorance of the Spanish people, their bigotry, intolerance, and the profound veneration they so long displayed for whatever is most worthy of contempt?

The numbers and wealth of the clergy and monastic orders were such as might be expected in a country where the Inquisition was triumphant, and where to commit a murder was a less offence than to insinuate a doubt as to the "real presence!" According to an official statement drawn up in 1812, it appears that the clergy were then in possession of about one fourth part of the landed property of the kingdom, exclusive of tithes and other casual sources of income, producing in all a

total gross revenue of about eleven millions sterling a year! The revenues of some of the dignified ecclesiastics were quite immense: the archbishopric of Toledo is said to have been worth from 65,000*l.* to 80,000*l.* a year.

According to the official returns of the census of 1787, the ecclesiastics of all descriptions, including 61,617 monks, 32,500 nuns, and 2,705 inquisitors, amounted to 188,625 individuals. (*Townsend*, ii. 213.) And it appears, from the official returns published in the *Correo Literario* of Madrid in 1833, that, notwithstanding the attacks made upon the ecclesiastical state during the French war and subsequently, it then comprised 175,574 individuals, of whom 61,727 were monks, and 24,007 nuns.

Happily, however, a very great change for the better has been effected in the interim. A decree, passed on the 23d of July, 1835, suppressed all conventual establishments with not more than 12 inmates; and the example thus wisely set was followed up by the decree of the 9th of March, 1836, which entirely suppressed all conventual establishments, and religio-military orders. The monks who were thus turned out of their old haunts were to receive small stipends; and it is to be regretted that, owing to the difficulties in which the country has since been involved, these stipends have been very irregularly paid. But the inconveniences thence arising affect only a few individuals, whose claims on the public sympathy were of the slenderest description; whereas the measure in which they originate cannot fail to be productive of great national advantage, and is, in fact, one of the most beneficial results of the late changes.

The whole of the vast property formerly belonging to the church has been confiscated for the use of the state, and a considerable portion of it has been already sold. According to the constitution, the nation undertakes to support the public worship and clergy of the established church; but, owing to the intestine commotions that have prevailed in the country, and its financial difficulties, this condition has not been effectively carried out; and not a few of the clergy are, at present, but little removed from a state of indigence.

It should further be borne in mind that, during the last half century, and especially since the commencement of the late struggle with France, the bigotry of the Spaniards, especially of the inhabs. of towns, and the influence of the priests, have materially declined. And, by a necessary, though unfortunate, consequence, the abuses and vices of the clergy have reacted against religion itself; and, at this moment, most intelligent persons in Spain, though making an outward profession of religion, entertain a profound contempt for the mummeries enjoined by the clergy, and are mostly, indeed, decided sceptics. According, however, as the church is purified, and ceases to be identified with every thing most deserving of reprobation, religion will, no doubt, recover its proper influence, and will cease to be degraded in the public estimation by the intolerance, extortion, and immorality of its professors.

Government.—At the period of the union of the crowns of Castile and Aragon, by the marriage of Ferdinand and Isabella, each of the kingdoms had representative assemblies, or cortes, that shared in the legislative authority, and enjoyed very extensive privileges. Unluckily, however, though the crowns were united, by the marriage now referred to, the kingdoms were not; each continued to preserve its own laws and institutions; and their mutual jealousies enabled the sovereigns to employ the one against the other, and ultimately to crush the liberties of both. This result was greatly facilitated by the extensive conquests of the Spanish sovereigns. In the reign of Ferdinand and Isabella, Granada, Navarre, and Naples, were subjected to the Spanish crown; so that the princes became, in a great measure, independent of the constitutional control of the cortes of their hereditary states. Under Charles V., who possessed, in right of his father, all the dominions of the house of Austria, and under whom all but boundless territories were acquired in the New World, the preponderance of the external dominions of the crown was vastly increased; and the defeat of the forces of the rebellious Castilians, under Padilla, in his reign, and the execution of the Justiza of Aragon in that of Philip II., completed the extinction of all constitutional control on the acts of the sovereign; at the same time that the Inquisition having first controlled, and next eradicated, all energy and independence of mind, the nation gradually sunk into a state of torpor and stupid indifference.

This state of things continued, with slight interruptions, till the invasion of Spain by Napoleon; when the mortified pride of the nation made them take arms in defence of their independence, and of the rights of the worthless imbeciles who had abdicated the crown. It is useless to enter into any details as to the events that followed. The novel circumstances under which the nation was now placed made it necessary to convoke her ancient cortes, and in 1812 a constitution was formed on a representative basis. This constitution was, however, abolished by Ferdinand the moment he was set at liberty

ratification of treaties of offensive alliance, of special treaties of commerce, and those which stipulate to give assistance to any foreign power. — 4. To absent himself from the kingdom. — 5. To contract matrimony, and to permit those who may be called to the throne to enter into that state. — 6. To abdicate the throne in favour of his immediate successor.

" Art. 49. The income of the king and royal family is to be settled by the Cortes at the commencement of each reign.

" *Of the Succession to the Crown.*

" Art. 50. Donna Isabel II. de Borbon is the legitimate Queen of Spain.

" Art. 51. The succession to the throne of Spain shall be in the regular order of primogeniture and representation, always preferring the anterior to the posterior line of succession; in the same line also preferring the nearer degree of kindred to the more remote; in the same degree, the male to the female line of descent; and in the same sex, the eldest to the younger branches of the family.

" Art. 52. The line of the descendants of Donna Isabel II. de Borbon becoming extinct, her sister and her uncles by the father's side, male as well as female, and their legitimate descendants, shall succeed, if not excluded specially by law.

" Art. 53. If the lines of succession pointed out become extinct, the Cortes shall name the sovereign as may be best for the interests of the nation.

" Art. 54. The Cortes shall exclude from the succession such persons as are incompetent to govern, or who have done any thing which should cause them to deserve forfeiting their rights to the throne.

" Art. 55. During the reign of a female her husband is to take no part whatever in the government of the kingdom.

" *Of the Minority of the Sovereign, and of the Regency.*

" Art. 56. The sovereign is to be considered a minor until he is fourteen years of age.

" Art. 57. When the king is incapacitated from exercising his functions, or the crown is vacant in consequence of the minority of the immediate successor, the Cortes shall appoint a regency for the government of the kingdom, consisting of one, three, or five persons.

" Art. 58. Until the Cortes shall appoint the regency, the kingdom shall be governed provisionally by the father or mother of the king, and in their absence by a council of the ministers.

" Art. 59. The regency shall exercise all the functions of royalty, in whose name shall be published all the acts of the government.

" Art. 60. The guardian of the king, while a minor, shall be the person appointed in the will of the deceased sovereign, always providing that such guardian shall be a Spaniard by birth; if the deceased king should not have appointed such guardian of the successor, a minor, to the throne, then the father or mother, being in the state of widowhood, shall be the guardian. In the absence thereof, the Cortes shall appoint; but the offices of guardian and regent cannot be discharged by the same individual, except in the case of a father or mother.

" *Of the Ministers.*

" Art. 61. All commands or dispositions issued by the sovereign shall be signed by the respective ministers; and no public functionary is to execute such orders if not thus signed.

" Art. 62. The ministers may be senators or deputies, and take part in the discussions of the two legislative bodies; but they are permitted to vote in that body only to which they belong.

" *Of the Judicial Power.*

" Art. 63. To the tribunals and judges alone belong the power to apply the laws in civil and criminal cases, and without exercising any other functions than those of judges and of ministers of justice.

" Art. 64. The laws are to determine the nature of the tribunals and judgments which are to exist, the organisation of each, its faculties, the mode of proceeding, and the qualifications of the officers belonging to them.

" Art. 65. Judgments in criminal cases to be public, and in the form prescribed by the laws.

" Art. 66. No magistrate or judge can be deposed, for a shorter or longer period, except by a written sentence, nor suspended from the discharge of the duties of his office, except by a judicial act, or in consequence of the order of the king, after he, on sufficient grounds, commands him to be tried by a proper tribunal.

" Art. 67. Judges are personally responsible for all infractions of the law committed by them.

" Art. 68. Justice is to be administered in the name of the king.

" *Of the Provincial Deputations and Corporations.*

" Art. 69. In each province there shall be a provincial deputation, composed of a number of persons specified by law, and appointed by the same electors who return the deputies to Cortes.

" Art. 70. For the internal government of towns a corporation shall exist in each, to be elected by the inhabitants to whom this right pertains by law.

" Art. 71. The law shall determine the organisation and duties of the provincial deputations and the corporations.

" *Of Taxes.*

" Art. 72. Each year the government shall submit an estimate of the expenses of the state for the following year, and a schedule of the contributions and of the means of raising them; and in like manner the accounts of the collection and disbursement of the public revenues, for the examination and approval of the Cortes.

" Art. 73. No tax or contribution is to be imposed or collected which has not been authorised by the law of the estimates or other special authority.

" Art. 74. A similar authorisation is necessary to dispose of the property of the state, and for raising money by loans on the public credit.

" Art. 75. The public debt shall be under the special protection of the nation.

" *Of the National Military Forces.*

" Art. 76. The Cortes, at the proposition of the king, shall each year determine the number of the permanent military forces by sea and land.

" Art. 77. In each province there shall be corps of national militia, whose organisation and duties are to be defined by a particular law; and the king may, in case of necessity, dispose of these forces within their respective provinces, but not out of them without the express authorisation of the Cortes.

" **ADDITIONAL ARTICLES.**

" Art. 1. The laws shall define the time and manner in which judgments by juries for every class of offences are to be established.

" Art. 2. The provinces beyond the seas shall be governed by special laws."

The business of the Spanish government is carried on by ministers of the interior, justice, foreign affairs, war, marine, and finance. The kingdom is now, as already seen, divided into 47 provinces, exclusive of the Balearic and Canary Islands. The constitution declares that a provincial deputation, or cortes, shall be elected in every province, for the superintendence of its internal affairs; and that corporations are to be established in the different towns. Such corporations have, indeed, long existed in Spain; and every *pueblo* in the kingdom, great and small, has, for a long series of years, had its *ayuntamiento*, or corporation, which manages the common property (often very large) of the pueblo; apports and levies the taxes required for public and private purposes, &c.; and otherwise enjoys considerable power and influence.

The laws of Spain, previously to the late revolution, and the greater number of those now in force, are embodied in the codes known by the titles of *Fuero Juzgo*, *Leyes de las Siete Partidas*, *Ordenamiento Real*, *Fuero Real*, and *Novissimo Recopilacion*. The first of these is, in the main, an abridgment of the Theodosian code, originally published by Alaric, son of Euric, one of the Gothic conquerors of the Peninsula, and successively augmented by the addition of new laws. The *Ordenamiento Real* contains the code of laws established by Ferdinand and Isabella. The *Leyes de las Siete Partidas* is a compound of Gothic, Roman, and canon law. The *Fuero Real* (a mixture of Roman and Gothic law) was compiled at Huesca in 1248, for the use of the kingdom of Aragon; and the *Novissimo Recopilacion* is a digested collection of edicts issued by the kings of Spain, and enjoys the highest authority. It cannot be surprising that, with so many different and often conflicting codes, the general system of jurisprudence should be extremely defective. But the administration of the laws is incomparably worse than the laws themselves, being slow, complicated, and protracted to a ruinous degree. There are endless appeals from one jurisdiction to another, and the whole machinery of the courts is adapted to screen the venality of the judges, and to afford a rich harvest to the *escribanos*, or attorneys, the only medium of communication between the client and the judge.

The wretched defects in the administration of justice were, in some degree, obviated, in so far, at least, as petty cases were concerned, by the adoption of a sort of arbitration system. Individuals, called *alcaldes*, annually chosen, according to the different privileges of the different towns, boroughs, and villages in which they reside, decide the cases brought before them, like Sancho Panza in the island of Barataria, according to their own sense of what is right and equitable. But, with the exception of this rude and defective tribunal, every other part of the Spanish judicial system is a tissue of the most scandalous abuses. There is, in fact, but little security for property, and still less for life.

A person robbed or assaulted may prosecute, but, if unsuccessful, is bound to pay all the expenses; and is, indeed, forced to lodge a sum of money with the *alcalde pedaneo* (sheriff's officer), before any steps be taken in the business. In cases of murder and assassination, witnesses are afraid to come forward, as it very frequently happens that they are imprisoned until they establish their innocence. And even when, braving all dangers, individuals boldly denounce a crime, there are at least three chances to one that the culprit escapes from prison, or compounds his felony with the judges; and in that case, the accusers have every thing to dread from the vengeance of the criminal. Thus, from bad laws, still worse administered, it is commonly said in Spain, that not one crime in ten is ever brought before the courts; and, though this be probably overstated, if we take the proportion at one in four or five, we shall perhaps be within the mark. Under such circumstances, need we wonder at the frequency of atrocious crimes?

We subjoin

An Account of the Criminal Processes brought before the Audiencia Courts throughout the Kingdom in 1844, from a Report from the Minister of Grace and Justice to the Queen.

Audiencia Courts.	Population.	Persons Tried.	Proportion.

Of the 38,620 persons tried, 31,684 had been condemned to various punishments, and 6,936 acquitted; 227 had been condemned to death. The analysis of the trials gives 600 accusations for political crimes; 202 for crimes against religion; 5,620 against public tranquillity; 2,548 smuggling and other offences against the public finance; 35 against public health; 17,688 against personal safety and honour; 10,425 against property; 67 perjury and other offences against justice; 562 coinage and forgery; 862 adultery, rape, and other crimes against good manners; and, lastly, 11 of abuses of the press.

Language, Literature, and Education.—It seems probable that the Cantabrian was the most ancient language of Spain, of which remnants are supposed by some still to exist in the modern Basque, spoken by the Biscayans and other inhabs. of the districts bordering on the Pyrenees. The old language of the Peninsula must, no doubt, have been considerably alloyed by the admixture of Phœnician words and phrases during the Carthaginian dominion; and when the Romans conquered Spain, they introduced their language, which, for several centuries, was the principal medium of communication of all except those living in the most remote districts. The Visigoths, who followed the Romans in the possession of the Peninsula, introduced the *lingua Romana*, a mixture of the Latin and German languages; but the Latin, though corrupt, still continued to be spoken in many parts. Again, when the Moors overran the country, expelled the Visigoths, and established their own power, they brought with them the Arabic language, already highly cultivated, and well adapted for poetry; and this, in turn, became the general language of the country. Thus, out of numerous elements was gradually formed a new language—the Spanish; and though numerous dialects necessarily arose in the different petty kingdoms into which the country was split, that of Castile became at length the classical language of Spain. Its basis is Latin; and many of the ancient inflexions, as well as words, are still preserved. There are also a large number of Teutonic words; but the admixture of Arabic, though very considerable, is less than in the Portuguese. Force of expression, depth of sound, and mellifluous cadence, are the peculiar characteristics of the Spanish; which, however, has a guttural accent, derived probably from its Teutonic origin. The abundance of vowels and liquids makes the language harmonious when spoken by native Castilians: it is essentially poetical, and poetry may be considered as the germ of the national literature. It is a curious fact, that there is very little *patois* among the Castilians, and that the language is spoken by the lower classes with remarkable purity and precision.

The rise of Spanish literature cannot be traced further back than the middle of the 12th century, for the songs of the Troubadours belong to a period antecedent to the settlement of the language. The ballads composed in honour of Rodrigo Díaz de Vivar, called *el Campeador*, or more popularly the *Cid*, are among the earliest specimens of Spanish writing, and display at once great independence of thought, and felicity of expression. No doubt, however, the Moorish ballads, or those written to celebrate the chivalrous contests between Christian and Moslem knights, that preceded and accompanied the fall of Granada, form the most striking and distinctive part of the national literature of Spain. "The Moorish wars had always afforded abundant themes of interest for the Castilian muse; but it was not till the fall of the capital that the very fountains of song were broken up, and those beautiful ballads were produced which seem like the rays of departed glory lingering round the ruins of Granada. They present a most remarkable combination of, not merely the exterior form, but the noble spirit, of European chivalry, with the gorgeousness and effeminate luxury of the East. They are brief, seizing single situations of the highest poetic interest, and striking the eye of the reader with a brilliancy of execution, so artless in appearance withal as to seem rather the effect of accident than study. We are transported to the gay seat of Moorish power, and witness the animating bustle, its pomp, and its revelry, prolonged to the last hour of its existence." (*Prescott's Ferdinand and Isabella*, ii. 260.) But it was, perhaps, hardly necessary to say so much about the Spanish ballads, as the admirable translations of Mr. Lockhart have made their spirit, at least, familiar to most readers.

The honour of being the first to introduce regular dramatic writing into Spain has been ascribed to Torres de Naharro, in the early part of the 16th century. He was followed by Lopez de Vega, born at Madrid in 1562, at once the most original, most unequal, and most voluminous of the Peninsular dramatists. Calderon, born in 1600, carried the Spanish drama to its highest perfection. Like his great precursor, Lopez de Vega, his plays are most unequal, the finest scenes being mixed up with the most revolting barbarism and extravagance. The astonishing fecundity of these writers may in some degree account for, though it cannot excuse, the defects and incon-

sistencies in their dramas. The published works (which do not, however, embrace nearly all his pieces) of Lopez de Vega consist of 25 vols. 4to., each containing 10 or 12 plays; and 127 dramas are ascribed to Calderon, besides a still greater number of vaudevilles, interludes, &c. The Spanish drama, however, has long fallen into decay. The humiliation of the country during the disastrous reigns of Philip IV. and Charles II., and the deadening influence of the Inquisition, were little favourable to its culture; and after the accession of the Bourbon dynasty to the throne, French criticism and taste obtained an ascendancy, while the troubles in which Spain has been more recently involved have stifled all poetical talent. Some endeavours, indeed, have been made to revive the national drama; but they have signally failed, and no modern name connected with this branch of literature deserves notice, except perhaps that of Martinez de la Rosa, the author of the *Viuda de Padilla*.

The *Araucana* of Ercilla, born in 1525, is the only poem that Spain has produced that has any pretensions to be classed among epics.

Chivalrous romance was early and assiduously cultivated in Spain. Happily, however, the inimitable satire of Cervantes destroyed at once and for ever the whole race of knights errant. His *Don Quixote*, however, still continues to interest all classes of readers by its exhaustless wit, the truth of its delineations, and its practical good sense. It has been rendered into almost all languages; and, how defective soever the translation, it never fails to amuse and instruct.

But, with the exception of this unique and admirable work, Spanish works are but little known in foreign countries; and in most departments, indeed, the literature of Spain is poor in the extreme. And how could it be otherwise? In 1502 the censorship of the press was established; and the power of carrying it into effect was very soon entrusted to the Inquisition. "*Il s'est établi dans Madrid*," says Beaumarchais, with quite as much of truth as of wit, "*un système de liberté sur la vente des productions, qui s'étend même à celles de la presse; et que, pourvu que je ne parle en vers écrits ni de l'autorité, ni de culte, ni de la politique, ni de la morale, ni des gens en place, ni des corps en crédit, ni de l'Opéra, ni des autres spectacles, ni de personne qui tienne à quelque chose, je puis tout imprimer librement, sous l'inspection de deux ou trois censeurs.*" (*Marriage de Figaro*, acte v.) Under such circumstances, it would be contradictory and absurd to expect that the Spanish writers should have distinguished themselves in philosophical research, original discussion, or in any pursuit requiring freedom of inquiry. Spain has a few respectable, but no great or eminent authors.

Since 1830, however, a great change for the better has taken place; the censorship of the press has been suppressed; newspapers have been established; and the influence and authority of the clergy greatly diminished. Hopes may, therefore, be reasonably entertained that literature will again revive; but no sudden development of the mental resources of the nation need be expected, and many years must elapse before literature acquire any material influence.

It would be to no purpose to take up the reader's time by entering into any lengthened details with respect to the state of education in Spain. Down to a very late period it was wholly in the hands of the clergy and the Inquisition; and, instead of contributing to expand and enlighten the mind, it was so contrived as to pervert every sound principle, and imbue it with the grossest and most unworthy prejudices. The education of the Spaniards has been, in fact, the complement of their religion; and, like it, has been fitted and intended to enslave and debase the people, and to make them believe that it was alike their duty and their interest to submit, without murmur and without inquiry, to whatever their temporal and spiritual rulers might direct. Nothing, of course, like moral or political philosophy was taught in any seminary of Spain; there was even but little progress made in the study of the learned languages, and science was in the most abject state. A thorough reform of the educational establishments of the country is indispensable; and it were better, indeed, that they should be wholly shut up than that they should continue on any thing like their ancient footing. Efforts have been already made to introduce an improved system of elementary instruction; but, unfortunately, it has been necessary, from the want of other qualified parties, to intrust the superintendence and management of the schools to the parochial clergy; and they, speaking generally, are decidedly hostile to the new order of things, which they not unnaturally regard as in the last degree inimical to their power and interests.

Taxes.—The taxation of Spain has been quite in harmony with her institutions, and, like them, seems to have been intended to obstruct as much good, and inflict as much evil on the country, as possible. Probably, indeed, the *alcabala* is the most objectionable tax that has ever been imposed. It originated in 1341, and consisted

at first of 10, increased, in 1642-54, to 14 per cent. *ad valorem*, charged on all commodities, whether raw or manufactured, as often as they were sold, and rated always according to the selling price! Such a monstrous impost was of itself sufficient to annihilate industry. It effectually hindered manufactures from making any progress in Castile and the other provinces subject to its destructive influence. And Ustariz, Ulloa, and Campomanes, Spanish authors of the highest credit, agree in opinion with Mr. Townsend, that it is to their exemption from this odious tax that the comparatively flourishing state of industry in Catalonia and Valencia is mostly to be ascribed.

The alcabala, however, no longer exists in its original form; but, even in its amended shape, it is in the last degree objectionable. It is now converted into local duties, or octrois (*derechos de puertas*), paid on bringing products within towns and villages.

In some instances the rate of duty has been diminished, but in the larger number it has been greatly increased. The same duties are not imposed in different towns; almost every one having a peculiar rate for itself. In general it is fixed by the *ayuntamiento*, or council of the town. Most foreign manufactured goods pay about 30 per cent. *ad valorem*, some as much as 60 per cent., exclusive of the customs' duties charged at the frontier. Wine pays a duty which in many places is equal to 100 per cent. upon its value; and oil from 60 to 75 per cent. The duties press severely on every class, but chiefly on the poor, and are the subject of universal complaint. The *ayuntamiento* receives a certain per centage upon the amount collected at the gate of the town for local objects; the rest goes to the public treasury. In small villages it is levied only on necessaries, as meat, fowls, eggs, oil, corn, &c.

In towns which are not walled, or have no gates, a tax called the *equivalente* is levied, that is, the inhabs. are assessed in such a sum as the alcabala would probably produce, calculating from the revenue afforded by other towns of the same size. The *alcalde* and *ayuntamiento* are responsible for its payment, and they divide the sum very arbitrarily amongst the householders, according to their estimate (influenced, of course, by every sort of partiality) of the products each ought to consume.

Next to the alcabala, tithe was the most oppressive tax in Spain, and the most complained of. Formerly it was exacted with the greatest rigour, and from articles (amongst others, from *las malas mugeres, de lo que gallan con su cuerpo*—*Ley de Partida*, 3d tit. 20. part 2.), which might have been considered beyond the reach of even clerical rapacity. Arguelles estimated the value of the tithe at 600 millions of reals; and, according to official documents, it amounted, in 1608, to 620 millions. In 1820,

however, it was estimated, by a commission appointed to inquire into the subject, at only 335,694,000 reals; but it is believed that this estimate was as much below the truth as the former was probably above it. The clergy, however, did at no time receive the whole of this immense income; and within the last few years it has been wholly suppressed. In 1845, a direct tax on immovable property, estimated to produce 300 millions a year, was established in lieu of the tithe and of direct taxes. The clergy are now, (though, as already stated, with no great regularity), paid, as in France, by stipends from government, amounting to 135,592,786 reals, ex. a sum of above 18 millions paid for the support of nunneries.

Next to this tax the most important are the customs' duties, and those on salt and tobacco. The revenue derived from the latter is very considerable. Every one may buy any quantity of tobacco he chooses, provided he buy it in the government *estancos*; but salt is the subject of assessment. The intendant fixes the consumption which should take place in every town under his charge, and the total quantities are delivered to the *alcaldes*, who fix the specific quantity for which each individual must pay, whether he use it or not. The land-owners, farmers, &c. are charged with a quantity proportioned to the number of individuals in their employment, and of the cattle and sheep which they possess.

Stamps are not a very important article of revenue, and do not, indeed, produce so much as the lottery. The latter, however, is admitted not to bring into the coffers of the treasury a third part of what it takes from the pockets of the people! The *crúzada*, or bull granting permission to eat meat on Fridays, and four days every week during Lent, is in general demand all over the kingdom, and yields a nett revenue of above 13 millions. The other principal items of revenue are specified in the subjoined account. And how objectionable soever, still it must be admitted that the taxation of Spain has of late years been materially improved. And should the reform that has been begun in the customs' duties be carried to such an extent as to suppress that smuggling which has long been the bane of regular industry in Spain, a vast additional improvement will be effected. Next to the reform of the customs' duties, a reduction of the octrois, or duties on entering towns, would probably be most advantageous.

Formerly the revenue and expenditure of Spain were shrouded in impenetrable mystery; but now, thanks to the establishment of a constitutional government, they are comparatively well known. We subjoin the estimates of the expenditure and revenue for 1849, laid before the Cortes by Señor Mon. We are assured they may be relied on.

ESTIMATE OF EXPENDITURE FOR 1849.			ESTIMATE OF REVENUE FOR 1849.		
	Ordinary Estimate.	Extraordinary Estimate.		Gross Revenue.	Net Revenue.
	Reals.	Reals.		Reals.	Reals.
Dotation of the Royal Family	45,900,000		Tax on immovable property, &c.	300,000,000	300,000,000
Legislative bodies	1,218,330		Ditto on trades and professions	34,000,000	34,000,000
Department of Foreign Affairs, diplomatic salaries, &c.	11,343,640		Arrears of direct taxes	27,570,000	27,570,000
Ditto Grace and Justice	18,613,955		Ditto of suppressed taxes	8,000,000	8,000,000
Ditto War, including the civil guard	300,000,000	42,500,233	Tax on the production of articles of general consumption, and duties on the same levied at town gates	158,000,000	158,000,000
Ditto Marine, including the coast guard	69,565,714		Ditto on sale and transmission of property	30,000,000	30,000,000
Ditto Home Department	47,789,367	3,000,000	Customs' duties	161,000,000	161,000,000
Ditto Commerce, Instruction, and Public Works	60,117,032		Tobacco monopoly	165,000,000	123,896,664
Ditto Finance, (civil employes, &c.)	118,369,628		Salt ditto	100,000,000	81,296,000
Passive classes (retired allowances, pensions, &c.)	144,896,674		Stamps	22,000,000	20,359,783
Repayments, arrears, and payments attached to the products of the revenues	-	92,473,261	Gunpowder	6,000,000	2,913,125
Law charges bearing on all the revenues	16,861,214		Lotteries	70,000,000	21,393,000
Salaries and expenditure of the dependencies of the public debt, and interest of the same (dividends on the Three per Cent. Stock)	100,242,957		Obligations indorsed to Bank of S. Fernando	15,676,530	15,676,530
Obligations of the secular clergy—except of Basque provinces, 1,29,592,786; ditto, of Basque prov., 6,000,000; total, 135,592,786; ditto of nuns in convents, 18,043,586	153,636,372		Product of national property of all kinds	30,595,650	27,432,836
	1,088,665,083	138,363,494	Mines of Almaden and Almadenillos	30,800,000	26,614,667
Resumen—ordinary expenditure	-	1,088,665,083	Ditto Riotinto, Linares, &c.	3,188,800	1,499,074
extraordinary ditto	-	138,363,494	Bull of the Cruzada	14,000,000	13,346,900
	-	1,226,918,577	Surplus revenue from the Spanish colonies	100,000,000	100,000,000
Comparison—Budget of ordinary and extraordinary expenditure for 1849, exclusive of reproductive expenditure	-	1,226,918,577	Ditto "eventual revenues"	4,000,000	4,000,000
Ditto of revenue, with equal excision	-	1,226,974,921	Post-office	26,300,000	11,080,287
	-	-	National printing-office	1,000,000	239,480
	-	-	Mint	1,096,750	225,763
	-	-	Twenty per cent. on corporate property	5,500,000	5,500,000
	-	-	Product of 45 other items of revenue	67,513,160	63,408,912
	-	-		1,372,234,018	1,226,974,921
	-	-	The reproductive expenses amount to 145,259,097 reals.		
Excess of income	-	56,344			

The list of taxes has been materially reduced since 1845; but it is still very great, comprising no less than

from 60 to 70 items. Of these, about 30 produce, respectively, less than 10,000*l.* a year, and some not more

than 1%? It is plain that the greater number of these cases should be reported. They serve only to embarrass industry and to weaken legislation and enterprise.

According to some recent official statements, the total debt of Spain amounted in 1881 to about 16,000 million real, or 32,000,000,000 pesetas, of which the foreign debt amounted 1,000 million real, or 2,000,000,000 pesetas. A large portion of the latter is due to Englishmen, and the interest has been paid on it for about 15 years past. The national debt is, to a considerable extent, made up of claims arising out of the confiscation of the property of the property of charitable institutions, and on birth, and thus it is probable will be considerably reduced, before they are finally adjusted. The interest on the debt is estimated at about 150 million real.

A very considerable portion of the national property consisting of the estates formerly belonging to the church, is in all kinds of ways difficult to turn into any estimate of what it might bring, were it put up to sale, as that would depend on the supposed stability of the present order of things, the quantity thereof on the market, and various other considerations. On the whole, however, it is sufficiently plain that, at present, Spain is not in a condition to pay the interest on her debt. But there has been criticism from the knowledge of the country, to form an opinion upon such a point, desirable to doubt that, by the judicious carrying out of these reforms in her economical system, of which a disagreement has happily been made and by the adoption of retrenchment in the public expenditure, she may be enabled ultimately to discharge her engagements.

The bulk of the troops were formerly divided into two great classes, and the division is not yet wholly obliterated. The veteran generals and the veteran privates. The former were collected throughout all Spain, with the exception of Basque. They included the veterans derived from the peninsular, the empire, Mexico, Cuba, and together with the royal companies of cast, veteran and garrison. The veteran privates were collected only in the provinces belonging to the crown of Castile and the sea, therefore about Biscay, Navarre, Catalonia, Aragon, or Valencia, which had peculiar and long her distinctive name.

Army. The regular army may amount to about 100,000 men, and there is besides an extraordinary organized militia. But though numerous, brave, and patient under fatigue and privation the Spanish soldier is almost everywhere and especially common to the military character. The troops are, then for the most part, badly drilled and badly equipped and will not bear to be compared in any respect with those of England, Prussia, Germany or Russia. The cavalry are particularly ill equipped, and the engineering department is such as might be expected from the state of science in the country. But, two distinct names the troops are, as all events, superior to the others, and it is a curious and not easily explained fact that, during the whole of the late war with France, not a single individual attached to distinction as a commander or soldier any superior ability in the art of war or in the conduct of conventional warfare. Some of them were great general leaders, but nothing more.

The Spanish navy was on formation, and comprises only a half of the fleet, a frigates, some smaller vessels, and a few steamers.

Races. Character &c. — There are few distinct races in Spain. At the Spanishs, who form the bulk of the population. All the Spaniards (about 25,000,000), descended from the ancient Celtiberians, and living in Navarre and the Basque Provinces, all the Spaniards, descended of the Moors, about 1,000,000 of whom still reside in Gra-

Notes

The character of the Spaniards has been very carefully drawn, but though it differs materially in different provinces, its distinguishing features are not to be mistaken. Though everywhere slow, cautious, and deliberate, they possess, when their passions are roused, enthusiasm and persistence in the enterprise. Though for the most part they are avaricious to their country, and though grave, quiet. The pride of the Spaniards is powerful, and they entertain the most overbearing opinion of their nation and their country. Though strictly, they are

* The reader is warned, in a notice printed at the end of the present work, to beware of the danger of Spain, &c.

easily offended, vindictive, and more inclined to revenge real or fancied insults than to conciliate wrongs. They are fond to excess of show and ostentation, and will endure the greatest privations to have to make a display to public. Their various institutions and their customs have made them to the last degree turbulent and quarrelsome. They are infinitely less patient and more haughty, and their integrity less honest, patient rather than active. They have seemed to fast to some extent about religion, and are satisfied if they observe the facts and unvarying ceremonies which it requires. Their ignorance often makes them attached to what is most common to themselves, and those who wish to gain their favour by denouncing some dogma about frequently find, to their surprise, that it is the object of popular abhorrence. They are impulsive in coming and departing, though it may be doubted whether this be not more the consequence of nervousness than of choice. Spanish are speaking generally even more arrogant to Spaniards than to foreigners, and the Portuguese maintain that at the period of the war, in 1808, the provinces divided with the object the duty of revenge to the nation.

We mention, from the works of two of the most distinguished Englishmen who have visited Spain, Mr. Gifford, Baron and General Bage, authors of the statement work on the Peninsular War the following notions of the Spanish character:—

The Spanish temperament, equally due to the uncontrolled strength and to the degenerated state of disposition, is somewhere more indulgent than in Spain. Thousands of men in all parts of the world are seen to pass their whole day wrapped up in a cloak, standing in rows against a wall, or doing under a tree. In that state of every individual is motion, the springs of their intellectual faculties being to play, their whole lives confined within the restricted sphere of mere existence, and they never seem to begin or learn any thing better than their present state of vegetation. They find little of an excuse for the weakness in glory of a country where the surface of the earth is represented by a few overgrown families, who seldom have a thought on the condition of their country. The poor Spaniard does not work unless urged by immediate want, because he proceeds to advantage either from industry. As his food and raiment are purchased at a cheap expense, he spends no more time in labour than is absolutely necessary for securing the scanty provision his dissolute habits require. I have heard a peasant refuse to run an errand, because he had that morning arrived at work already at twelve last but the day without putting himself to any further trouble. Yet I am convinced that this laziness is not essentially inherent in the Spanish constitution, for it is frequently witnessed among them to exercise with what eagerness they pursue any domestic avocation with what pleasure they perform work upon them, and when vigor and exertion of power they display when awakened by a bull-fight, or the more constant agitation of gaming—a vice in which they are especially addicted. Were it again possible, by an intelligent spirited administration, to set before their eyes in a clear and forcible manner, proper institutions of civility and industry the Spaniards might yet be rescued from their lethargy and led to riches and civilization, but I consider the task to be as difficult than I look upon it rather as an Utopian than as a feasible one, even likely to take place.

Their customs are loose and perfect of laziness, wherever their efforts lead them, they will follow without striving, though it be up to the mouth of a battery of cannon, but unless the example be given them by their commanders, not a man will they advance. That of the Spaniards are hardy, and, when once engaged, go through difficulties without murmuring, save the murmuring of the common with bravado, and support large with amazing perseverance. They sleep every night in their camps on the ground, are sparing in food, passing more from a sense of habitual indigence than from any aversion to gluttony, whenever they are sent to the pursuit of another man's wife, they will go down to shame, and not content with eating their fill, will carry off whatever they can stuff into their pockets. I have more than once seen a whole tribe of a village of a village by the numerous hunt and capture which the king had after them to attempt wherever they are looked. They are fond of sports, and more so of any thing without an action, pleasure or game; they delight in even the most trivial of the popular game, and of all that has a ring, small and large, instead the same all kinds that keep awake to their passage and devote their mind; in fact the highest leap is often handed down to the table, that such man may take the quantity he chooses. Their horses are used to drive in smoking and driving. At times but dry birds of food, in-spiriting with the purring quality of the atmosphere are designed to ensure of the spirit make of the common people in Spain, where the potato and the mackerel are almost the only well-did partly figures to be met with.

"The Spanish is by no means a naturally courteous and friendly nation, and Spaniards have cast a gloom over them, however, no doubt, by the long habit of distrust and narrow inspired by the Inquisition, for every village still resembles with the music of viols and guitars, and their here and there we remark daily outcry and riotous. They talk trade and argue with more refinement than even the French or Italians, and quarrel with equal if not superior, eagerness. The stout people of southern climes, they are dirty to their persons, and covetous with regard to" (French, II 198)

"The Spanish character," says General Hughes "is distinguished by immediate pride and arrogance. Dignity and respectability, the individual as well as the most all-potent as above mentioned that every thing is possible which their heated imaginations suggest. Over-estimated, they can see no difficulty in the execution of a project, and the obstacles they encounter are attributed to treachery. Kind and warm in his attachments but bitter in his anger the Spaniard is patient under provocations, firm in tacitly enduring, prone to sudden passion, vindictive, bloody vengeance exacts longer than injury and even to his revenge. There is not upon the face of the earth a people so attractive in the friendly intercourse of society. Their magnetic language, fine personae, and becoming dress, their lively imaginations, the spontaneous beauty of their women, and the air of elegance which they throw over every action, and infuse into every feeling, all combine to subvert the senses and impose upon the judgment. As enthusiasts, they are, consequently the most agreeable of mankind, but danger and disappointment attend the man who, confiding in their promises and energy ventures upon a distant enterprise. Never do to-day what you can put off till to-morrow is the favorite proverb in Spain, and slightly followed." (Ibid. &c.)

In Spain there is a good deal of aristocratic pride, and the distinction of rank is much attended to. The Indians, or gentry claim to be descended from those Spaniards who, on the subjugation of the rest of the country by the Moors, found an asylum in the fastnesses of the northern mountains, whence they again gradually spread their conquering arms over the whole country. Besides the Indians or nobles, as they are called, there are also Indians of privilege, or by office, conferred on them by the sovereign, but of these there are comparatively few. According to the official returns, there were in the kingdom in 1797 600,000 Indians, of whom no more than 601,000 belonged to the Asturias, Biscay, Burgos, Castile, and Leon. Many of the Indians are extremely poor, and they are all tolerably proud.

The graduates of Spain, who are the real nobility of the country are the descendants of those who, in our liberation of their continent carried the principles of speaking to the Cortes covered in progress of the life. A man may be a *don* that is, he may enjoy the title of duke, marquis, or count, without being noble, and in Spain, in fact, such titles are of little more consequence than that of baronet in this country.

The bishops formerly enjoyed various privileges, but these have now been very much curtailed. Among others, they could elect lords of ecclesiastical estates.

There are very few theatres in London, and there is a systematic system to be seen in the street. Not the least the theatre is over all its light lantern with its and lights. Besides is usually taken to the evening, when nearly the entire pop is abroad. Festivals or evening parties, are very frequent in the great towns. The theatre is little frequented. *Ball-Adts*, though discontinued by government, are in Spain what the circus was in London. Only the national passion, for the dance, and chief amusement of all classes. Though by no means entitled to high rank as amusements, the Spaniards have considerable theatrical taste, and all classes are passionately fond of dancing, the national dances being the *huera* and *fandangos*, the former a graceful easy movement, the latter a dance of force and impetuous character, which were in good society

The lower strata lie on weathered Gneiss, rarely out
to the west, and rise only occasionally, except on the

quest. The farming laborers live somewhat better, the chief articles of food being bread, soup, garlic, honey, and garden-herbs, with the accompaniments of wine and oil. Notwithstanding the suppression of the ancient, unwholesome, and exceedingly prevalent, and perhaps the only remedy for this incurable disease is the substitution of all undergarments for purpura, and the establishment of some provision for the poor as in England. Cloths and broad-brimmed hats are very generally worn by the men, and the mantilla and shawl are universal and becoming female.

Mr. Townsend, Mr. Totten, and all other travellers to Spain, have given descriptions of bull-fights. We extract the following account from Inglish's work, and commend it to the best test; however it is one of the most recent.

The bull fight is the national game of Spain, and the hero of the Spaniards for this sport is almost beyond belief. He goes to Madrid, in days during the season of the bull fight, a kind of holiday every body looks forward to the enjoyment of the afternoon, and all the conversation is about his term. Frequency of repetition makes no difference to the true connoisseur of the bull fight, he is never weary of it. At all times he finds leisure and money to devote to his favorite pastime. The sportsman is generally respected, in the nation of his majesty to begin at least a count, and, before them, all the streets leading towards the gate of Atocha are in commotion, the Calle de Atocha, in particular throughout its whole business extent, is filled with a dense crowd, of all ranks and conditions, pouring towards the gate. A considerable number of carriages are also seen, even the royal carriages, but these arrive later, and there are also many mark admirers, their usual burden being a gunner and two girls dressed in their bolero clothes, for there is no way of showing gallantry or worth approved, among the braver orders, as treading to a bull fight.

I had been able to secure a place in one of the best boxes. The spectacle was most surprising, the whole amphitheatre, and to estimate 12,000 persons, was filled in every part, round and round, and from the ground to the ceiling, carrying the imagination back to antiquity, and to the barbarism of a Roman holiday. The arena in front of the R. is immense, it is surrounded by a strong wooden fence, about 8 ft. in height, the upper half consisting about a foot or so to have, in the middle of this fence, a stepping place, by which the men may be able, in time of danger, to throw themselves out of the arena. Behind this fence there is an open space about 8 ft. wide, extending all the way round, meant as a retreat, and where, also, the men in reserve are in waiting to meet their companions should be killed or disabled. Behind this space is another higher and stronger fence bounding the amphitheatre, for the spectators. From the lower the seats decline backwards, rising to the outer wall, and above these there are boxes, where are all seated, and are, of course, open to view. The best place in the house next about is, the best in the amphitheatre itself, shown in fig. 1, the second-best place, next to the ground

with 4 rounds. . . . The pioneers are mounted on horseback each holding a long lance or pole, and are the first to engage the bull has to overtake, they stationed themselves on different sides of the arena, about 50 yards from the door at which the bull enters, and at a flourish of trumpets the gate flew open, and the bull rushed into the arena; this produced a deafening shout, and then total silence. The bulls differ very widely in courage and character—some are rash,—some cool and thoughtful,—some wary and cautious,—some cowardly,—others immediately upon perceiving the horse and his rider, rush upon them,—others run following round the arena,—some make towards one or other of the aides, who, at the same moment that the bull appears, leap into the arena and entangle—leaps upon their arms; others stop after having advanced a little way into the arena, look on every side, and seem uncertain what to do. The blood of the bull is generally first split by a slight blow upon the forehead, who generally rushes then upon his place, swarming his arms round about the stealer. Sometimes the bull, feeling himself wounded, retires to make take a different plan of attack,—but a good bull is not turned back by a wound,—he presses on upon his enemy, even if he dares to the horse be hurried deeper to his death. Attended to the mane of the bull is a crimson ribbon, which it is the great object of the pioneer to seize, that he may prevent to his capture this important trophy of his prowess. I have frequently seen the ribbon torn off at the moment that the bull closed upon the pioneer.

"The first bull that entered the arena was defeating both in courage and strength the second was a Gervill bull of Navarre, from which province the best are considered to come; he passed only for a moment after entering the arena, and then tamely retired upon the nearest pillar, who wounded him in the neck but the bull, disregarding this, thrust his head into

the horse's belly, and threw both him and his rider upon the ground: the horse ran a little way, but, encumbered with trappings, he fell; and the bull, disregarding for a moment the fallen picador, pursued the horse, and, pushing at him, broke the girths, and disengaged the animal, which, finding itself at liberty, galloped round the arena, a dreadful spectacle, covered with gore, and its entrails trailing upon the ground. The bull now engaged the chulos; these young men show great dexterity, and sometimes considerable courage, in the running fight, or rather play, in which they engage the bull, flapping their cloaks in his face, running zigzag when pressed, and throwing down the garments to arrest his progress a moment, and then vaulting over the fence, an example which is sometimes followed by the disappointed animal. But this kind of warfare the bull of Navarre seemed to consider child's play; and leaving these cloaked antagonists, he made furiously at the other picador, dexterously evading the lance, and burying his horns in the horse's breast: the horse and his rider extricated themselves, and galloped away; but suddenly the horse dropped down, the wound having proved mortal.

"The *banderilleros* then entered: their business is to throw darts into the neck of the bull; and, in order to do this, they are obliged to approach with great caution, and to be ready for a precipitate retreat; because it sometimes happens that the bull, irritated by the dart, disregards the cloak which the *banderillero* throws down to cover his retreat, and closely pursues the aggressor. I saw one *banderillero* so closely pursued, that he saved himself only by leaping over the bull's neck. The danger, however, is scarcely so great as it appears to the spectator to be; because the bull makes the charge with his eyes shut. The danger of the picador who is thrown upon the ground is much greater; because, having made the charge, the bull then opens his eyes, and the life of the picador is only saved by the address of the chulos, who divert the attention of the victor. Generally the *banderilleros* do not make their appearance until the bull appears, by his movements, to decline the combat with the picadors, which he shows by scraping the ground with his feet, and retiring. If the bull show little spirit, and the spectators wish that he should be goaded into courage, the cry is '*fuego*,' and then the *banderilleros* are armed with darts, containing a kind of squib, which explodes while it sticks in the animal's neck.

"When the people are tired of the *banderilleros*, and wish to have a fresh bull, they signify their impatience in the usual way, and the signal is then given for the *matador*, whose duty it is to kill the bull. The *matador* is in full court dress, and carries a scarlet cloak over his arm and a sword in his hand: the former he presents to the bull; and when the bull rushes forward, he steps aside and plunges the sword in the animal's neck; at least so he ought to do, but the service is a dangerous one, and the *matador* is frequently killed. Sometimes it is impossible for the *matador* to engage upon equal terms a very wary bull, which is not much exhausted. This was the case with the sixth bull which I saw turned out: it was an Andalusian bull, and was both wary and powerful. Many times the *matador* attempted to engage him, but without success; he was constantly upon the watch; always disregarding the cloak, and turning quick round upon the *matador*, who was frequently in imminent danger. At length the people were tired of this lengthened combat, and, seeing no prospect of its ending, called for the *sema-luna*, an instrument with which a person skulks behind, and cuts the ham-strings of the animal: this the bull avoided a long while, always turning quickly round; and even after this cruel operation was performed, he was still a dangerous antagonist, fighting upon his knees, and even pursuing the *matador*. The moment the bull falls he is struck with a small stiletto, which pierces the *cerebellum*; folding doors, opposite to those by which the bull enters, are thrown open, and three mules, richly caparisoned and adorned with flags, gallop in; the dead bull is attached by a hook to a chain, and the mules gallop out, trailing the bull behind them: this is the work of a moment,—the doors close,—there is a new flourish of trumpets, and another bull rushes upon the arena.

"And how do the Spaniards conduct themselves during all these scenes? The intense interest which they feel in this game is visible throughout, and often loudly expressed; an astounding shout always accompanies a critical moment: whether it be the bull or the man who is in danger, their joy is excessive; but their greatest sympathy is given to the feats of the bull. If the picador receives the bull gallantly, and forces him to retreat; or, if the *matador* courageously faces and wounds the bull, they applaud those acts of science and valour; but if the bull overthrow the horse and his rider, or if the *matador* miss his aim, and the bull seems ready to gore him, their delight knows no bounds. And it is certainly a fine spectacle to see the thousands of spectators rise simultaneously, as they always do when the interest is intense: the greatest and most crowded theatre in Eu-

rope presents nothing half so imposing as this. But how barbarous, how brutal, is the whole exhibition! Could an English audience witness the scenes that are repeated every week in Madrid? A universal burst of 'shame!' would follow the spectacle of a horse, gored and bleeding and actually treading upon his own entrails, while he gallops round the arena: even the appearance of the goaded bull could not be borne,—panting, covered with wounds and blood, lacerated by darts, and yet brave and resolute to the end.

"The spectacle continued two hours and a half; and during that time, there were seven bulls killed, and six horses. When the last bull was despatched, the people immediately rushed into the arena, and the carcass was dragged out amid the most deafening shouts."

Historical Notice.—After being in part occupied by the Carthaginians, Spain became the prey of the Romans, by whom she was finally subdued in the reign of Augustus. After enjoying a lengthened period of tranquillity and prosperity under the sway of the Romans, Spain was invaded, in the beginning of the 5th century, by the Vandals, and other Gothic tribes; and in the next century the Visigoths acquired the ascendancy, and established their supremacy in every part of Spain. The latter, however, were not long permitted peaceably to enjoy this fine and fertile country. In 711 a powerful Arabian force crossed the strait of Gibraltar, and having defeated the Visigoths, and killed Roderick, their king, in a great battle near Xeres de la Frontera, in Andalusia, they speedily overran the whole country, driving the remains of the Visigoths into the fastnesses of the North, where they did not think it worth their while to follow them. But the Saracens having been signally defeated by Charles Martel, in France, and their fiery zeal having cooled, the Christians began to descend from the mountains of the Asturias, and gradually recovered portions of the lower countries. The kingdom of Leon was founded under Alphonso I., about the middle of the 8th century; and from that period, notwithstanding the superior civilisation, learning, and splendour of the Saracenic sovereigns, the Christian power was progressively increased at the expense of that of the Mohammedans.

The provinces that were wrested from the Moors were not formed into one, but into several independent states, which, however, were, for the most part, gradually merged in Castile and Aragon. In the 15th century these two leading states were united by the marriage of Ferdinand of Aragon with Isabella of Castile; and, having conquered Granada, the last possession of the Moors, in 1492, and subsequently seized all that part of Navarre to the S. of the Pyrenees, the whole of Spain was united under the same government; and Naples being at the same time conquered, and America discovered, Ferdinand, besides being one of the ablest princes of his day, became the most powerful.

Ferdinand was succeeded by his grandson, Charles I., known in history as Charles V., Emperor of Germany; who added, by his father's side, the archduchy of Austria and the Low Countries to the vast inheritance of Spain and the Indies, now augmented by the conquest of Mexico and Peru. Charles, the most illustrious by far of the Spanish sovereigns, was succeeded in his Spanish dominions and in the Low Countries by his eldest son, Philip II., the husband of Queen Mary, of England, who, having conquered Portugal, in 1580, reduced the entire peninsula into one kingdom.

The conquest of Portugal may be said to mark the culminating point of the Spanish monarchy. The tyranny and intolerance of Philip had already, indeed, raised a rebellion in the Low Countries; which, after a struggle unexampled for duration, for the sacrifices it entailed on the weaker party, and for its beneficial consequences, terminated in the independence of the Seven United Provinces. The power of Spain now began rapidly to decline. The seeds of this decay had, however, been profusely scattered in the reign of Ferdinand and Isabella. The establishment of the Inquisition and of the censorship of the press, and the attacks made on the ancient rights and liberties of the nation, paralysed its energies; and the unsuccessful rebellion of the commons of Castile, under Charles V., and the brutal and ferocious bigotry of Philip II., extinguished every spark of civil and religious liberty, and subjected the country to the vilest of all despotisms, that which principally depends for support on intolerance, superstitious zeal, and religious quackery.

Under such a government Spain either continued stationary or retrograded, while the surrounding nations made rapid advances in the career of civilisation. Her sovereigns were as imbecile as the country; and on the death of Charles II., the last prince of the Austrian line, the monarchy was dismembered; and it was the arms of Louis XIV., and the talents of the Duke of Berwick, and not the will of the deceased monarch or the wishes of the Spaniards, that placed a Bourbon dynasty on the throne.

The new dynasty was less intolerant than that to which it succeeded; and some reforms were introduced during the course of last century. These, however, were of comparatively slight importance; and it was clear that the abuses under which the country laboured were so deeply seated, and so entwined with every existing institution, and with the habits and prejudices of the people, that they could not be eradicated, nor even materially abated, otherwise than by a revolution.

This was brought about by the weakness of the Spanish sovereigns and the immeasurable ambition of Napoleon. Not satisfied with a considerable subsidy from Spain, Napoleon wished to reduce it to the state of a prov. of France; and in this view he procured the abdication of the reigning monarch, Charles IV., and proceeded to seat his brother Joseph on the vacant throne. The opposition made by the Spaniards to this transfer, and the important results to which it led, are well known to every body, and need not be here alluded to. We are not, however, of the number of those who are inclined to ascribe any great merit to the Spaniards for their opposition to Napoleon, who, but for the interference of England, would have had no great difficulty in suppressing the insurrection. It is idle to talk of the patriotism of the Spaniards. The government, for which they took up arms, was nothing but a tissue of abuses; and their "beloved" sovereigns the merest drivellers. But the pride of the nation was hurt; and the priests, who knew that the ascendancy of the French would be a death-blow to them, did not fail to set them in the most odious light, and used every possible means to make them the objects of fanatical hatred. But, as already stated, it was the arms of England, and the extraordinary talents of her great general, and not the stupid fanaticism of the Spaniards, that repulsed the French beyond the Pyrenees. It is unnecessary to recapitulate the events that followed the restoration of Ferdinand. After years of civil war and bloodshed, a liberal government has happily been established. Whether it be destined to last, time only can show; but if it be, there can be no doubt that the abuses which still infest the country will be gradually exterminated, her gigantic resources developed, and the well-being of her people, and her power and importance in the scale of nations, vastly increased.

The best works on Spain in the English language are the *Travels of the Rev. Joseph Townsend*, and the *Handbook of Spain*, by Richard Ford, Esq. Townsend's is a masterly performance; and besides giving an accurate account of the state of Spain in 1786 and 1787, he has investigated the causes of her decline, or stationary state, with a sagacity and a success that will not easily be surpassed. Mr. Ford's *Handbook* is the work of a gentleman and a scholar, and is the *facile princeps* of its class. "It contains," to borrow the expressions of a great authority, "an amount of curious learning, acute criticism, and a familiarity with the character and condition of the people, such as is not to be found elsewhere, as far as I know, in the Castilian or any other tongue." (*Prescott's Conquest of Peru*, li. 172., ed. 1848.)

SPALATRO, a city and sea-port of Dalmatia, on the Adriatic, opposite the island of Brazza, lat. 45° 30' 12" N., long. 16° 26' 33" E. Pop. 7,500. It is surrounded by ruined walls, is the seat of an archbishop, has a cathedral and several other churches, a lazaretto, several convents, a gymnasium, normal school, &c., with barracks, and a military hospital. It has both an outer and inner harbour, the former affording secure anchorage to vessels of any burden. It has rather a considerable trade, consisting principally in the exportation of the produce of the surrounding country, as well as of products brought from Bosnia, including cattle, horses, figs, rosoglio, wax, &c. There are thermal springs in the immediate vicinity of the town.

Spalatro, however, would hardly have been worth mentioning in a work of this kind, but for its containing the ruins of the magnificent palace built by Diocletian. The emperor belonged to Salona, a now ruined city about 3 m. N.N.E. from Spalatro; and being warmly attached to his native country, he retired thither to spend the remainder of his days, after his abdication of the imperial purple, A. D. 305. From the vastness of the palace, it is all but certain that he had begun its erection long previously to his abdication, though, most probably, in the contemplation of that extraordinary event. The situation seems to have been most judiciously chosen. "The soil is dry and fertile, the air pure and wholesome; and, though extremely hot during the summer months, this country seldom feels those sultry and noxious winds to which the coasts of Istria, and some parts of Italy, are exposed. The views from the palace are no less beautiful than the soil and climate are inviting. Towards the W. lies the fertile shore that stretches along the Adriatic; in which a number of small islands are scattered in such a manner as to give this part of the sea the appearance of a great lake. On the N. side lies the bay which led to the ancient city of Salona; and the country beyond it appearing in sight, forms a proper contrast to that more

extensive prospect of water which the Adriatic presents both to the S. and the E. Towards the N., the view is terminated by high and irregular mountains, situated at a proper distance, and, in many places, covered with villages, woods, and vineyards." (*Adam's Ruins of Spalatro*, p. 6.) The want of good water, its only defect, was obviated by the construction of an aqueduct, which conveyed an abundant supply from Salona.

The palace was in the form of a quadrangle, flanked by 16 towers. Its longer sides, including the towers, were each 698 ft. in length, and its shorter 592 ft., so that it covered in all nearly 94 English acres! It was constructed of a beautiful freestone, but little inferior to marble. "Four streets, intersecting each other at right angles, divided the several parts of this great edifice, and the approach to the principal apartment was from a very stately entrance, still denominated the golden gate. The approach was terminated by a *peristylum* of granite columns; on one side of which we discover the square temple of *Æsculapius* (now the church of St. John the Baptist), and on the other the octagon temple of Jupiter (now the cathedral). The buildings were all lighted from the top, and appear to have consisted only of one story." (*Gibbon*, cap. 18.)

Diocletian expired in this splendid retreat, A. D. 313. The emperor Constantine Porphyrogenitus, who could only see the palace in a neglected and decaying state, affirms that no description could convey a proper idea of its grandeur. Even now, though the town of Spalatro has been principally built out of its ruins, its prodigious remains give a vivid idea of the wealth and magnificence of the Roman emperors. (*Gibbon*, *ubi supra*.)

SPALDING, a market town and par. of England, co. Lincoln, wapent. Elloe, div. Holland, on the Welland, 33 m. S.S.E. Lincoln. Area of par., 12,070 acres. Pop., in 1841, 7,721. Though within the fens, the town is well drained, the streets clean and well paved, and the houses have a neat appearance. It consists of four principal streets, and has a spacious market-place, at one end of which is the town-hall. In the same open space is the house of correction for the division of Holland, a brick building, constructed at an expense of 16,000*l.*, but said to be in several respects defective. (*See Inspect. of Prisons*, 3d Rep.) The par. church, originally erected in the 13th century, but rebuilt, with some additions, during the 18th, is a light structure in the Perpendicular style, with a fine tower and crocketed spire, and a handsome porch. There are places of worship for Independents, Baptists, Wesleyans, Friends, &c., and many charities; including Queen Elizabeth's Grammar School, with common, blue-coat, and other schools. There are assembly and card-rooms in the town-hall, a subscription library, a literary club, &c.; and formerly an antiquarian society was established at Spalding, of which Sir Isaac Newton, Sir Hans Sloane, Dr. Stukely, and other eminent persons, were members. The Welland is navigable thus far for sloops of 50 tons burden, which come up to the centre of the town, and land or take in cargoes at the doors of the warehouses. Spalding has a considerable trade in corn, coal, and Yorkshire and Norfolk wool; and its weekly market is the largest in the county for the fat cattle reared in the adjacent marsh lands. Most part of the neighbourhood is appropriated to grazing. It has long been the principal seat of the law-courts for the div. of Holland. At present, quarter and petty weekly sessions are held in the town, and it has a county court, before which 591 plaints were entered in 1848.

SPANDAU, a strongly fortified town of Prussia, prov. Brandenburg, gov. Potsdam, at the junction of the Havel with the Spree, 7 m. W. Berlin. Pop., in 1837, ex. garrison, &c., 6,753. "Spandau, in the time of the great Frederick, was, and still continues to be, the state-prison of Prussia. Being filled with troops, it has more the air of an enormous barrack than of a town; and is, in point of fact, so regarded. Both its citadel and penitentiary are deserving of notice; the former, on account of its position on an island of the Spree, the latter, because it is said to be managed with exceeding skill." (*Gleig's Germany*, &c., i. 56.) The citadel is a regular square with 4 ramparts, 40 ft. in height, and good casemats; the penitentiary was formerly the residence of the electors of Brandenburg, and now has, says Berghaus, 750 inmates, many of whom are criminals sent from the capital. The principal streets are clean, airy, and spacious, in spite of the disproportionate height of the houses. The church of St. Nicholas, constructed in the 16th century, has a great number of monuments. Spandau is the seat of a civil tribunal, and a forest-board; and has some manufactures of woollen and linen cloths, tobacco-pipes, and earthenware; with breweries, distilleries, &c. It was the scene of Baron Trenck's captivity. It was taken by the Swedes in 1631, and the French in 1806. (*Berghaus; Stein*, &c.)

SPANISH-TOWN (or *Santiago de la Vega*), the cap. and seat of the legislature of the isl. of Jamaica, co. Middlesex, on the river Coire, about 6 m. from the sea,

2,000, of whom nearly a half are whites. It appears from a distance like the summit of a lofty submarine mountain, rising abruptly from the shore in rugged and almost perpendicular cliffs, varying from 800 to 1,500 ft. in height, diversified in a few places with deep narrow ravines, descending to the sea, and forming difficult landing places for the fishermen. In the largest of these, toward the N. W., is James' Town, the cap. and port of the island. The interior is a plateau, about 1,500 ft. above the sea, divided into two unequal parts by a ridge or mountains rising about 500 ft. above the plain, and 2,000 ft. above the sea: the highest summit of this ridge, called Diana's Peak, is 2,708 ft. in height. The geological formation of the island consists almost entirely of basalt, over which in some parts are strata of limestone mingled with tufa and other igneous substances, proving it to have once been the seat of volcanic action. A deep crater-like dell, however, called the Devil's Punch-bowl, is the only feature at all resembling an extinct volcano. The climate is mild, and little variable, the thermometer ranging between 87° and 70° Fahr. in winter (June, July, and Aug.), and between 68° and 78° in summer (Jan., Feb., and March). Rain is common, especially in Feb. and July; and the frequency of cloudy days tends greatly to moderate the heat. The influence of the climate over the constitution of residents in the island is, however, said to be most disastrous. According to O'Meara, it is "extremely unhealthy, hepatic and dysenteric prevailing to an extent and with a severity seldom paralleled, so that very few persons pass their 45th year." (*Notes from St. H.*, ii. 458.) About a fifth part of the entire surface is covered with soil, which, though not deep, is rich and productive. Luxuriant pastures are found on the high lands: agriculture, however, is but little attended to; and the inhabs. mostly depend on foreign supplies for their support. The valleys are chiefly laid out in garden ground, and here may be seen near each other, and all flourishing alike, the mangoes, banana, tamarind, and sugar-cane of the tropics, the orange, citron, grape, fig, and olive of S. Europe, and the apple, gooseberry, and currant of a still colder region. The yam and all the European vegetables are abundant, three crops of potatoes being often raised from the same ground within the year. The tops and sides of the hills are covered with the cabbage tree, dog-wood tree, and gunwood; and the oak, also, has been introduced. The *Palme Christi* and common blackberry are so luxuriant as to be eradicated with difficulty. Cattle and sheep are not numerous, the latter being barely sufficient to supply the wants of the shipping. Goats graze in immense numbers on the high grounds. Neither birds nor hawks of prey, if we except rats, are found, but the latter are numerous and destructive, and there are many varieties of troublesome and poisonous insects. Game is abundant, and the coast furnishes excellent fish. Whales and turtles are often seen near the shore, especially in Jan. and April.

St. Helena, of which the East India Company were "the lords proprietors" till 1834, is now under a military governor, assisted by a civil secretary; and the laws are administered by the chief judge. It is still used as a place of refreshment for vessels sailing northward on the Atlantic, those proceeding southward not being able to make the island. Its commerce is trifling; the value of the imports, principally consisting of stores for shipping, not exceeding from 40,000*l.* to 50,000*l.* a year.

James' Town, the port and the residence of the authorities, is the only town. The anchorage is good in 12 fathoms water, and the port is well protected from the winds. The town is entered by an arched gateway, within which is a spacious parade lined with official residences. The church, a handsome building, fronts the gateway; and close by it a street branches off into the inner parts of the town. The shops are plentifully supplied with English and Asiatic products, but the prices are invariably very high. The principal inhabs. reside on the higher and cooler parts of the island, and visit James' Town only on Sundays, or when the want of supplies obliges them to come to its shops and market. One of the handsomest of these villas is Plantation House, a mansion of considerable elegance, belonging to the governor, situated in the midst of extensive grounds, adorned with a variety of fine trees and shrubs.

Longwood, the residence of Napoleon, stands on the plateau, in the middle of an extensive park. When first occupied by the ex-emperor, it was of very limited dimensions; but some additions were subsequently made to it. After Napoleon's death, the house was for some time uninhabited. Latterly, it has been converted into a kind of farming establishment; and, very recently, the room in which the conqueror of Austerlitz breathed his last was occupied as a cart-house and stable!

St. Helena was discovered on the 21st of May (St. Helena's day), 1602, by Juan de Noya, a Portuguese; but no establishment was formed, nor was the island inhabited, till the Dutch became its masters in the middle of the 16th century. Captain Munden, in 1673, took

Final destination. The great articles of importation are manufactured goods, principally from England, but partly, also, from other countries of Europe, with provisions, lumber, &c. from the United States. We subjoin an

ACCOUNT of the Import Trade of St. Thomas in 1840.

In the same year the principal arrivals were as follows:—

	Tons.	Tonnage.
Vessels of Denmark and New Granada:		
British ships	26	6,000
French ships	200	6,000
Spanish ships	200	6,000
Portuguese ships	200	6,000
Swedish ships	200	6,000
Other ships	200	6,000
Total	1,000	30,000

N. B. Besides a great number of vessels without landing any landing goods, being in that case free from port-charges.

ST. VINCENT. See VINCENOT (St.).

STADE, a town of Hanover, emp. district of its own name, on the Schwinge, near its mouth, in the Elbe, 30 m W N W Hamburg. Pop. with its suburbs and garriens, about 8,700. On the bank of the Elbe, adjacent to the town, is the castle of Brunschwien, near which a vessel is stationed to receive the toll exacted by the Hanoverian government on all vessels passing up the Elbe. Stade has three Lutheran churches, a gymnasium, a cavalry school, a central workhouse, &c. Its inhabitants are engaged in manufactures of flannel, hosiery, &c., and have some share in the transit trade on the Elbe.

Since 1793 English vessels have been allowed to call up to Hamburg without stopping to pay the duties at Brunschwien; they have, however, to be paid at Hamburg before the vessel can be cleared out. The duties are very heavy on certain descriptions of goods, and are, in fact, a great obstruction to trade. It certainly is not a little surprising that the different nations of Europe, and especially the English, should have submitted, for so long a period, to the imposition of a toll on what is really one of the most important commercial channels in Europe. If it be impossible otherwise to get rid of the nuisance, it would be good policy at once to buy an exemption from the duty.

STAFFA, an Hebridean, famous the W coast of U is of an oval shape uneven table-land highest being six the caves by white basaltic columns. The columns are or horizontal, and the columns is about 3 ft.; but they sometimes extend to 3 and 4 ft. They are generally pentagonal and hexagonal; they sometimes, however, have 7 or 8 sides, but are rarely triangular or rhomboidal. They are not so equidistantly united, nor are their angles as sharp as those of the Giant's Causeway.

Except on the N E shore place, it is almost every where covered with caverns. But the full swell of the Atlantic has been comparatively if equal caverns of which we are on the E side. Of the is Fingal's Cave, visited Banks, Dr. McCulloch, height of the cave, as given surface of the water, at its outlet or arch, is about 35 ft., and its depth 217 ft. (range of nearly perpendicular

nellid floor, parallel to the sides, extends along the whole length of the ceiling, which is formed of the bottoms of columns whitened by the infiltration of moisture of time into their interstices. The sea never entirely dries from the cave, the humid recesses of which may be discovered from without. In moderate weather boats sail up to its furthest extremity.

"It would be no less presumptuous than unwise," says Dr. McCulloch, "to attempt a description of the picturesque effect of that to which the pencil itself is inadequate. But if this cave were even destitute of that order and symmetry, that richness arising from multiplicity of parts combined with greatness of dimension and simplicity of style, which it possesses, still, the prolonged length, the twilight gleam half concealing the playful and varying effects of reflected light, the arch of the measured surge as it rises and falls, the transparent green of the water, and the profound and fairy solitude of the whole scene, would not fall strongly to impress a mind gifted with any sense of beauty to art or to nature."

(Geology of the W. Islands.) But the noblest description of this magnificent cave is that given by the great industrial—

There, as to show the temple's dome
By child of earthy toil;
Nature herself, it seems, would raise
A column in her Master's praise!
Not for a monarch we would build
Her columns, or her arches build;
Nor of a throne we would adorn
That mighty surge that rises and falls,
And all, pervades with a wild power,
From the high vault on caverned dome,
In vastness, and height,
That make the organ's melody.

Lord of the Isles, cant. in. st. 10.

In a note on this splendid passage, the author says, "It would be unpardonable to detain the reader upon a wonder so often described, and yet so incapable of being understood by description. This palace of Neptune is even grander upon a second than the first view. The stupendous columns which form the sides of the cave, the depth and strength of the tide which rolls its deep and heavy swell up to the extremity of the vault, the variety of the tints formed by white, crimson, and purple stalactites, or petrifications, which occupy the vacancies between the bases of the broken pillars which form the roof, and intersect them with a rich, curious, and variegated chasing, occupying each interstice; the corresponding variety below water, where the ocean rolls over a dark red or violet-coloured rock, from which, as from a base, the basaltic columns arise; the tremendous noise of the swelling tide, mingling with the deep-toned echoes of the vault, are circumstances elsewhere unparalleled."

Mackinnon's Cave and the Boat Cave, though inferior to that now described, are also magnificent caverns.

Staffa was first made known to the public by the interesting account of it given by Sir Joseph Banks, by whom it was visited in 1771. (Penny's Tour in Scotland, ii. 308, ed. 1788.) It is now, during summer, frequently visited by steamers; it is uninhabited, and has not even a house or hut in which any one can take shelter during a storm.

STAFFORD, a central co. of England, having N. Cheshire, E. Derby and Warwick, S. Worcester, and W. Salop. Area, 717,760 acres. Aspect very various. The N. part, or that portion of the co. lying to the N. of a line drawn from Uttoxeter, on the confines of Derbyshire, to Mowat's-under-Lyne, consists principally of moorlands. The hills, in some parts of this district, rise to an elevation of about 1,500 ft. above the level of the sea; sometimes consisting of vast heaps of gravel, and sometimes of huge cliffs, having immense masses of rock scattered round their bases. With the exception of some beautiful valleys, the whole of this district is sterile, cold, and dreary. The soil in many places is peat; but in some parts, particularly between the rivers Dove and Churnet, it is of a superior quality, and produces good herbage. The middle and S. parts of the co. are agreeably diversified with hills, level lands in pasture and corn, plantations, and gentleman's seats; but, in its extreme S. angle, the iron-works are its most prominent feature. The valley of the Trent is particularly fertile and beautiful. Cusworth Heath, immediately to the W. of Rugeley, contained, in 1813, above 25,000 acres; and is by far the largest of the remaining tracts of waste land in the co. Mr. Pitt estimated the cultivated land, including parks, at 383,000 acres, of which, he supposed, 100,000 may be meadow and pasture, and 283,000 arable. The latter he distributed as follows: viz. 200,000 acres of clay loam, or more friable mixed loam; 200,000 acres of gravelly or sandy loam, or other mixed, including calcareous soils; and the remainder, or 100,000 acres, of light sandy, gravelly, or other soils. (Survey, p. 12.) The air is sharp and cold; and, in the W. parts particularly, there is a great deal of rain. Stafford is more a mining

* These measures differ in great respects, but not materially, from those given by Sir Joseph Banks.

and manufacturing than an agricultural co.; but husbandry, though not so far advanced as it might be, is, of late, very considerably improved. Wheat, oats, barley, and hay are the principal crops. The usual rotation on the clay land is, 1 fallow; 2 wheat; 3 turnips; 4 clover; 5 oats. Various important improvements have been effected within the last 10 years, particularly on the estates of the Duke of Sutherland, who has extended large sums on drainage, on the building of new, commodious, and efficient farm-houses, and on other substantial improvements. The cattle of Staffordshire are principally of the long-horned breed; but, within no very distant period, they have been extensively crossed with short-horns; and the stocks of some of the principal breeders contain, at present, entirely of the latter. Dairy husbandry is extensively practised; cheese is the principal product, and it is but little inferior to that of Cheshire and Derby. The sheep stock is estimated at about 107,000, and the produce of wool at about 2,500 packs. Property in estates varying from 10,000*l.* a year down to the farms of all sizes, from 10 to 200 acres, but the smaller ones are decreasing, being frequently granted, but the greater number of farms held at will. A average rent of land, in 1845, was 1*l.* an acre. Coal, iron, and lime are found in the greatest abundance in most parts of the county. It is particularly famous for its pottery and iron manufactures. The chief seat of the former is in a district denominated The Potteries, between Newcastle-under-Lyme and Norton-on-the-Moore, in which there are several very considerable towns and villages, mostly supported by the business. The neighbourhood affords abundance of fine clay and sand; but the finest clays are principally brought from Farbrook, in Dorsetshire, (except some from Cornwall), and flints from the chalk pits near Groesend, and from Wales and Ireland. The iron-works are principally situated in the S. angle of the co., (in the vicinity of Walsley, Walsbury, Bilston, &c.) Their business has been quite extraordinary. In 1830 there were, in all, 135 furnaces, estimated to produce about 215,000 tons a year, being about double the produce of 1820. And since then the business has been but little inferior; for, though the number of furnaces had only increased, in 1845, to 155, of which 90 were in blast, they had been rendered so much more powerful and efficient, that their produce in that year was estimated at 335,000 tons, a quantity very decidedly exceeding all that was produced in all England besides! In this respect, indeed, Staffordshire is exceeded only by South Wales, which has, within these few years, taken the lead in this highly important branch of national industry. (*Artisan on the Iron Trade*, 1841.) The manufacture of locks, nails, edge tools, bridges, spurs, and an infinity of other hardware articles, is prosecuted upon a very large scale at Wolverhampton, Bilston, and Walsley, and their vicinity. Here, the famous establishment of Messrs. Boulton and Watt, where there is the greatest manufactory of steam-engines in the world, is situated within this co., on its extreme

western, 200 of whom may be accommodated in separate cells. Stafford has two par., St. Mary's and St. Chad's, now consolidated and in the patronage of the Lord Chancellor. St. Mary's is a large cruciform structure, in the early English style, from the centre of which rises a lofty octagonal tower, about 2,000 were seated, a few years since, by voluntary contributions for the repair and restoration of this venerable structure. Christchurch and St. Paul's have been recently erected; the latter is a good specimen of Gothic architecture. St. Chad's is a Norman structure, with more recent English additions. There is a small but very handsome Roman Catholic chapel; and the Wesleyan Methodists, Independents, and the Society of Friends, have each places of worship, mostly with attached Sunday-schools. The grammar school, on ancient foundation, was much enlarged by Edward VI.; the income from the endowment exceeds 500*l.* a year, two thirds of which are paid to the head master and the remainder to the scholar. It is open to all boys of the town; but the number of those on the foundation exceeds 20. The appointment of the masters is vested in the corporation, subject to the approval of the Bishop of Lichfield and Coventry. A dissenting national school is established here, and a Laminarian school is supported by subscription. The institution for the relief of the orphans and widows of the clergy within the archdeaconry of Stafford is not only liberally supported by subscription, but has an income of 2,000*l.* a year, arising from landed property. Superintended by inferior clergymen, also, are schools for the benefit of this charity. The county infirmary, in the Foregate, has accommodation for 120 in patients, and receives a much larger number of patients at their own dwellings. It has a respectable medical staff. The county lunatic asylum, established in 1810, receives patients not only from the co. itself, but from the kingdom generally, though the former are received on lower terms than the others. This establishment is supported both by subscriptions and funded property; it is admirably conducted, and may justly rank among the principal asylums in the kingdom. The buildings comprise accommodation for 170 patients, and the gardens cover an area of several acres. There is an almshouse; but it is only poorly endowed, and fast falling to decay. The manufacture of shoes is the principal employment of the inhabitants, and several manufacturers employ 100 hands; a good workman can earn from 10*l.* to 15*l.* a week, and there is a steady demand for labour. The tanning of leather is no longer carried on to any extent. Stafford is noted, in common with the neighbourhood, for the excellent quality of its ale.

The North Western Railway passes close to the town, where it has a principal station. It has been, and is doubt will continue to be, of great advantage to the town.

It has two weekly newspapers, and two books. Stafford was incorporated in the reign of John. It is divided, under the Municipal Reform Act, into two wards, its officers being a mayor, 6 aldermen, and 18 councillors. Corp. rev. 1845-6, 1,200*l.*

The custom and quarter sessions for the co. are held here. The bar has returned two members to the H. of C. since the 10th Edward I. the right of election down to the Reform Act being in the resident freemen. The Boundary Act included a part of the parish of Castlechurch with the old borough. Registered electors, in 1845-46, 1,200. The custom of borough-English, by which lands descend to the younger son, to the exclusion of his elder brothers, prevails within the town and liberties.

Stafford is, also, the election-town for the H. of Commons of the co., as well as the principal one of a poor-law union comprising 11 par. Markets on Monday: cattle, April 5., May 14., June 25., Oct. 2., and Dec. 5., chiefly for bacon and mutton. There is also a thrice-weekly cattle market.

STAFFORD, a par. and town, bar and market-town of England, head of the co., in the above co., of which it is the cap., on the River, crossed here by a most noble bridge, 20 m. N. W. Birmingham. Pop. of par. bur., which includes, with the old bur., a portion of the par. of Castlechurch, in 1841, 9,100. It is generally well-built, the houses, several of which are handsome, being of brick and stone, and is paved and lighted with gas, under the provision of a local act. A good supply of water is procured from several public pumps. The principal street runs N. N. W. from the bridge, and near its centre is the market-square, in which is the county-hall, a large modern building of stone, comprising several handsome apartments, besides an assembly-room, a grand jury room, courts for the sessions and assizes, mayor's clock, and other apartments. The county gaol is also a modern structure of extensive dimensions, and well arranged, both for the health and classification of

has recently been practised on a very extensive scale. In the carse, wheat, beans, barley, and clover, but particularly the first two, are the principal crops. On the lighter lands, turnips are largely cultivated; oats being the prevailing crop on all the poorer high lands. Potatoes generally cultivated. Sheep mostly of the black-faced Linton breed; but Cheviots have been largely introduced. Besides the cattle bred in the co., which are not remarkable for their goodness, great numbers of Highland cattle are annually purchased for feeding at the Falkirk *trysts*. These are the greatest fairs, or markets for cattle, of any in Scotland. They are held on the 2d Tuesday of Aug., Sept., and Oct.; the last being the largest. Cattle in all sorts of condition are brought to them from all parts of Scotland, but principally from the north; as are also sheep and horses. At an average, it is supposed that about 80,000 cattle, 50,000 sheep, and 5,000 horses, are annually disposed of at these *trysts*. Estimating the cattle to be worth 7*l.* each, the sheep 1*s.*, and the horses 10*l.*, their entire value will be nearly 650,000*l.* (*Yonatt on Cattle, &c.*, p. 121.)

Stirlingshire is said to have about 12,000 acres of natural wood, and above 10,000 acres of plantations. The E. parts of the co. have a finely diversified appearance; and the view from Stirling Castle is, perhaps, unequalled by any other in Britain. (*See next art.*) Coal abundant; and there are large supplies of ironstone, freestone, &c. Average rent of land in 1843, 1*s.* 6*d.* an acre. Extensive works have long been established at Carron, for the smelting of iron, and the manufacture of all sorts of cast-iron goods, whether for civil or warlike purposes. (*See CARRON.*) Exclusive of distilleries, some branches of manufacture, on a pretty considerable scale, are carried on at St. Ninian's, Stirling, Falkirk, and other towns. Principal river, Forth; to which are tributary the Carron, Bannockburn, and other small streams. Stirling has 25 par., and returns 1 mem. to the H. of C. Registered electors for the co. in 1849-50, 2,476. The bor. of Stirling unites with the bors. of Inverkeithing, Dunfermline, Queensferry, and Culross; and the bor. of Falkirk with those of Linlithgow, Lanark, Airdrie, and Hamilton, in returning representatives. In 1841, Stirling had 18,813 inhabited houses, and 82,057 inhabitants, of whom 41,004 were males, and 41,053 females. Valued rent, 108,509*l.* Scotch. Annual value of real property, in 1815, 218,767*l.*; do. in 1843, 279,705*l.*

STIRLING, a royal and parl. bor., river port, market town, and fortress of Scotland, cap. of the above co., on the Forth, 20 m. W.N.W. Edinburgh, and 22 m. N.E. Glasgow. Pop. of parl. bor., which includes the suburb of St. Ninians, in 1841, 10,701. The situation of Stirling is magnificent in the extreme. It is built on the S.E. declivity of a hill, which, rising from one of the most fertile plains in Scotland, terminates on the N. and W., immediately over the river, in an abrupt basaltic rock, about 300 ft. in height, surmounted by a fine old castle. It consequently bears a striking resemblance to Edinburgh; but its situation is finer, more central, and in all respects more suitable for the capital of Scotland. The view from the castle, if not unrivalled, is, at all events, unsurpassed by any other in the empire. It combines all that can give variety, interest, and grandeur to a prospect. To the E. it extends over the richest valley in Scotland, as far as Edinburgh, commanding all the windings of the Forth; to the W. is the fertile strath of Menteith, the view in this direction being bounded by Ben Lomond; on the N. it is bounded by the range of the Ochill hills; and immediately to the S. is the field of Bannockburn, the Marathon of Bruce and of Scotland.

"The principal street, which extends from the castle down the ridge of the hill, with narrow cross streets branching from it down the declivity on each side, is open and spacious; and the houses, though many of them bear marks of antiquity, are generally lofty and comfortable. A new bridge over the Forth (finished in 1835) has been begun, and streets are proposed to be built from it on the low ground to the E. of the town. Several neat houses have lately been erected in the neighbourhood. Many respectable families have been induced to settle in Stirling, in consequence of the cheapness of living, the beauty of the surrounding country, and the society which the town affords." (*Parl. Bound. Rep.*)

The principal building is the castle. A fortress is said to have been erected on its site by the Romans, and there can be no doubt of its great antiquity. Its inaccessible situation in the centre of the kingdom, at the point where the Forth first becomes fordable, renders it, as it were, the key of the Lowlands on the one hand, and of the Highlands on the other. No wonder, therefore, that Stirling early became a place of great importance, and that it was for a lengthened period a favourite royal residence, and the seat of the legislature. Previously to the invention of artillery, the castle was a place of great strength; but, notwithstanding the additions made to the works in more modern times, it could not oppose any effectual resistance to an army properly supplied

with artillery. It is a quadrangular building, with an open area in the centre, and, besides other structures, includes the old royal palace, principally built by James V., and the parliament house; but these venerable structures have, by a scandalous outrage on taste and national associations, been degraded into barracks for common soldiers! It is stipulated in the articles of union with England, that Stirling castle shall be always garrisoned, and kept in repair.

Among the public buildings in the town are the town-house, gaol, Cowan's hospital, founded in 1639, and richly endowed; the athenæum, with a spire 120 ft. in height, a hall for the circuit and sheriff courts, &c. The old church, a venerable Gothic edifice, a portion of which formed part of the Franciscan monastery, founded in 1494, has long been divided into two places of worship: James VI., when a child, was crowned in it, on the 29th of July, 1567, the coronation sermon being preached by the famous reformer, John Knox. Three churches belong to the establishment; 2 to the Free Church, 2 to the United Presbyterians, and 1 each to the Reformed Presbyterians, Independents, Episcopalians, Wesleyan Methodists, and Rom. Caths. Some of the houses formerly occupied by the principal Scotch nobles are still met with in different parts of the town. Religious dissent prevails in Stirling, perhaps to a greater extent than in any other town of Scotland. Ebenezer Erskine, one of the ministers of Stirling, was (along with his brother Ralph, one of the ministers of Dunfermline) a founder of the Secession, or Associate Synod, about 1740. This town has been long eminent for its schools, particularly those for classical literature. It has also a mechanics' institute, and several public libraries.

Exclusive of Cowan's hospital, noticed above, founded by a citizen of that name, Stirling has two other well-endowed hospitals, exclusive of the interest of 4,000*l.* left in mortmain for behalf of the poor. But, "where the carcass is, there will the eagles be gathered together;" and, notwithstanding the ample provision in question, pauperism is quite as prevalent in this as in most other Scotch towns. Assessment for the poor in 1849, 2,456*l.*

The chief manufacture is that of tartans, tartan shawls, carpets, and yarns, which is carried on to a large extent; and the dyeing of yarns, home-made cloths, and silks is also carried on. Cotton goods are manufactured, though to no great extent, with ropes, malt, leather, soap, and candles. The town has extensive markets, the Corn Exchange being one of the finest in Scotland: it has also a considerable coasting and retail trade. About 100 vessels are said to be engaged in the trade on the Forth up to Stirling, and steam-packets, which in summer are crowded with passengers, ply daily between the town and Granton Pier, near Edinburgh. The town has a branch bank of the Bank of Scotland, with five other branch banks, and two weekly newspapers.

Stirling received its first charter from Alexander I. in 1120; it is now governed by a provost, 3 bailies, and 18 councillors. Corporation revenue, about 3,000*l.* a year. The bor. unites with Dunfermline, Culross, Inverkeithing, and S. Queensferry, in sending 1 mem. to the H. of C. Registered electors, in 1849-50, 557.

Stirling and its immediate vicinity has been the scene of some of the most memorable events in Scotch history. In 1297 Wallace defeated a formidable English army close to the town; and the victory of Bruce at Bannockburn, in 1314, secured the independence of Scotland. James II. was born in the castle; and there, in 1452, he basely murdered, with his own hand, the Earl Douglas, whom he had inveigled thither by the grant of a safe conduct, and the assurances of friendship! Stirling was also the birth-place of James V., and it continued to be his favourite residence. Here, also, James VI. resided with his tutor, the celebrated George Buchanan (*Scotorum sæculi facile princeps*), till he was 13 years of age; and here, as already stated, he was crowned in 1567.
